Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support Pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the alignment finishes *before* the abort function is performed, so `:ABORT` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an **:INIT:IMM** command is received.

Remote Command	:ABORt
Example	:ABOR
Notes	If :INIT:CONT is ON , then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :INIT:CONT is OFF , then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, :ABORt is equivalent to the Restart key Not all measurements support this command
Status Bits/OPC dependencies	The STATUS:OPERation register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATUS:QUEStionable register bit 9 (INTegrity sum) is cleared Since all the bits that feed into OPC are cleared by :ABORt , the Abort command will cause the *OPC query to return true

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. This query is available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	[:SENSe] : <meas> : SWEep : ETIME? <meas> is the identifier for the current measurement; any one of CHPower - ACPower OBWidth MONitor
Example	Channel Power :CHP : SWE : ETIME?
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

3.10.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution will change. Trace data for all the traces will be cleared and, if Sweep is in Cont, a new trace taken. If any trace is in average or hold, the averaging starts over.

Because of sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message "Sweep points changed, all traces cleared" is displayed and in the 5G NR mode, Auto Sweep Points is set to OFF(0).

Remote Command	<code>[:SENSe]:MONitor:SWEEp:POINts <integer></code> <code>[:SENSe]:MONitor:SWEEp:POINts?</code>
Example	<code>:MON:SWE:POIN 1000</code> <code>:MON:SWE:POIN?</code>
Dependencies	This function is not available when Signal ID is set to On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in modes that do not support Swept
Couplings	Whenever the number of sweep points change: <ul style="list-style-type: none">- All trace data is erased- Any traces with Update Off will also go to Display Off (like going from View to Blank in the older instruments)

- Sweep time is re-quantized
- Any limit lines that are on will be updated
- If averaging/hold is on, averaging/hold starts over
- Auto Sweep Points is OFF (Only 5G NR)

The resolution of setting the sweep time depends on the number of points selected

Preset	1001 unless noted below 2001: 5G NR
State Saved	Saved in instrument state
Min	1
Max	20001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

Auto Sweep Points

When **Auto Sweep Points** is **ON**, the instrument determines the points using the following calculation formula:

$$\# \text{ points} = \text{ceil}(\text{Span} / (\text{Rbw} * 1\text{e}3)) * 1000 + 1$$

Where $\text{ceil}(x)$ returns the smallest possible integer value that is greater than or equal to x .

Remote Command	<code>[:SENSe]:MONitor:SWEep:POINts:AUTO[:STATe] OFF ON 0 1</code> <code>[:SENSe]:MONitor:SWEep:POINts:AUTO[:STATe]?</code>
Example	<code>:MON:SWE:POIN:AUTO 0</code> <code>:MON:SWE:POIN:AUTO?</code>
Dependencies	This parameter is available only in the 5G NR mode
Preset	ON
State Saved	Yes
Range	OFF ON

3.10.10 Trace

Lets you control the acquisition, display, storage, detection, and manipulation of trace data for the available traces.

The **"Trace Control"** on page 2392 tab in this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

3.10.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the Trace menu
Dependencies	For the Swept SA measurement: <ul style="list-style-type: none">- In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View- When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when Meas Method is RBW , FAST or FPOwer , Select Trace is disabled
Preset	Trace 1
State Saved	Yes

3.10.10.2 Trace Control

The controls on this tab allow you to set the "**Trace Type**" on page 2393 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "**View/Blank**" on page 2398 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	WRITE	:TRAC2:TYPE WRIT	See: "Clear/Write" on page 2396
Trace Average	AVERage	:TRAC2:TYPE AVER	See: "Trace Average" on page 2396
Maximum Hold	MAXHold	:TRAC3:TYPE MAXH	See: "Max Hold" on page 2397
Minimum Hold	MINHold	:TRAC5:TYPE MINH	See: "Min Hold" on page 2397

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "**View/Blank**" on page 2398 state must be set to **Active** (**Update: ON**, **Display: ON**) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "**Trace Mode Backwards Compatibility Commands**" on page 2394

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:TYPE WRITE AVERage MAXHold MINHold</pre> <pre>:TRACe[1] 2 ... 6:TYPE?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:TYPE WRITE AVERage MAXHold MINHold</pre> <pre>:TRACe[1] 2 3:<meas>:TYPE?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<pre>:TRAC:TYPE WRIT</pre> <pre>:TRAC:TYPE?</pre>
Couplings	<p>Selecting a Trace Type (by pressing any of the Trace Type selections or sending :TRAC:TYPE) sets the Trace to Active (Update: ON, Display: OFF), even if the same trace type was already selected</p> <p>When Detector setting is "Auto" ([:SENSe] :<meas>:DETECTOR:AUTO?), Detector ([:SENSe] :<meas>:DETECTOR[:FUNCTION]?) switches aligning with the switch of this parameter: "NORMAL" with WRITE (Clear Write), "AVERAGE" with AVERage, "POSITIVE (peak)" with MAXHold, and "NEGATIVE (peak)" with MINHold</p>
Preset	<p>Swept SA and Monitor Spectrum: WRITE</p> <p>All other measurements: AVERage</p> <p>Following Preset, all traces are cleared (all trace points set to mintracevalue)</p>

State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In the X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "**View/Blank**" on page 2398.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The **:TRACe:MODE** command is retained for backwards compatibility, and the **:TRACe:TYPE**, **:TRACe:UPDate** and **:TRACe:DISPPlay** commands introduced for ongoing use. The old Trace Modes are selected using **:TRAC:MODE**, whose parameters are mapped into calls to **:TRACe:TYPE**, **:TRACe:UPDate** and **:TRACe:DISPPlay**, and the old global Averaging command **[:SENSe]:AVERage[:STATe]** is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Mode Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or **:INIT:IMM**, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	WRITE
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	:TRACe[1] 2 ... 6:MODE WRITE MAXHold MINHold VIEW BLANK :TRACe[1] 2 ... 6:MODE?
Backwards Compatibility Notes	The legacy :TRACe:MODE command is retained for backwards compatibility. In conjunction with the legacy :AVERage command, it works as follows: <ul style="list-style-type: none"> – :AVERage ON OFF sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the [:SENSe]:AVERage[:STATe] command description below – :TRACe:MODE WRITE sets :TRACe:TYPE WRITE (Clear/Write) unless average is true, in which case it sets it to :TRACe:TYPE AVERage. It also sets :TRACe:UPDate ON,

`:TRACe:DISPlay ON`, for the selected trace

- `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE BLANK` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANK`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In the X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to the X-Series:

- pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

Preset	<code>OFF</code>
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	<code>[:SENSe] :AVERage [:STATe] ON OFF 1 0</code> <code>[:SENSe] :AVERage [:STATe] ?</code>
Backwards Compatibility Notes	<p>Previous to the X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe] :AVERage [:STATe] ON OFF 1 0</code> was used to turn Averaging on or off</p> <p>In the X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another</p> <p>For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command <code>[:SENSe] :AVERage [:STATe] OFF ON 0 1</code>. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old <code>:TRAC:MODE</code> command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write</p>

Further details of each Trace Mode type:

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data

- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 2393 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

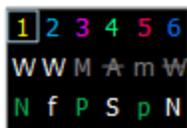

- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF ; Display ON
Blank	Update OFF ; Display OFF
Background	Update ON , Display OFF Allows a trace to be blanked <i>and</i> continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

See: "More Information" on page 2400

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 2399 and "Trace Display State On/Off" on page 2399 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	<p>Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in Active (Update ON and Display ON), even if that trace type was already selected</p> <p>Selecting a detector for a trace (pressing the key or sending <code>[:SENS] :DET :TRAC</code>) puts the trace in Active (UpdateON and DisplayON), even if that detector was already selected</p> <p>Selecting a Math Function other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in Active (UpdateON and DisplayON), even if that Math Mode was already selected</p> <p>Loading a trace from a file puts that trace in View regardless of the state it was in when it was saved; as does being the target of a Copy or a participant in an Exchange</p>

Trace Update State On/Off

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe]?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<p>Make trace 2 inactive (stop updating):</p> <pre>:TRAC2:UPD 0</pre>
Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	<p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p>
State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:DISPlay[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:DISPlay[:STATe]?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe] ON OFF 1 0</pre>
----------------	---

	<pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<p>Make trace 1 visible:</p> <pre>:TRAC2:DISP 1</pre> <p>Blank trace 3:</p> <pre>:TRAC3:DISP 3</pre>
Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	<p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p>
State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the **:SENSe** system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

Trace Settings Table

Lets you configure the Trace system using a visual utility.

Clear All Traces

Clears all traces from the display.

Remote Command	<code>:TRACe:MONitor:CLEar:ALL</code>
Example	<code>:TRAC:MON:CLE:ALL</code>
Backwards Compatibility SCPI	<code>:DISPlay:MONitor:VIEW:WINDow:TRACe:CLEar:ALL</code>

3.10.10.3 Detector

Lets you choose and configure detectors for the selected trace.

Detector

Allows you to select a specific detector for the current measurement. When the detector choice is Auto, the instrument selects the detector. The selected detector depends on marker functions, trace functions, and trace averaging functions for the current measurement.

The following options are available:

AUTO	The detector selected depends on marker functions, trace functions, average type, and the trace averaging function In the ACP measurement, when in AUTO, the detector selected is set to AVERage, unless the Radio Standard defaults state otherwise e.g., it is set to Peak for Radio Standard = PDC when Device = both MS and BTS, and when Radio Standard = NADC and Device = MS
NORMal	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
AVERage	The detector determines the average of the signal within the sweep points, using RMS averaging
POSitive	The detector determines the maximum of the signal within the sweep points
Peak	
SAMPle	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
NEGative	The detector determines the minimum of the signal within the sweep points

Peak

Because they may not find a spectral component's true peak, neither **AVERage** nor **SAMPle** detectors measure amplitudes of CW signals as accurately as Peak or **NORMal**, but they do measure noise without the biases of Peak detection.

Remote Command	<code>[:SENSE]:MONitor:DETEctor:TRACe[1]2 3 AVERage NEGative NORMal POSitive SAMPle RMS</code> <code>[:SENSE]:MONitor:DETEctor:TRACe?</code>												
Example	<code>:MON:DET:TRAC NORM</code> <code>:MON:DET:TRAC?</code> <code>:MON:DET RMS</code> Sets the detector to AVERage . AVERage uses RMS averaging, so this is equivalent to selecting RMS												
Notes	The query returns a string corresponding to the detector type as shown below <table border="1"> <thead> <tr> <th>String Returned</th> <th>Definition</th> </tr> </thead> <tbody> <tr> <td>NORM</td> <td>Normal</td> </tr> <tr> <td>AVER</td> <td>Average (RMS)</td> </tr> <tr> <td>POS</td> <td>Peak</td> </tr> <tr> <td>SAMP</td> <td>Sample</td> </tr> <tr> <td>NEG</td> <td>Negative Peak</td> </tr> </tbody> </table> The RMS selection sets the detector type to AVERage with RMS averaging. Therefore, if RMS has been selected, the query returns " AVER "	String Returned	Definition	NORM	Normal	AVER	Average (RMS)	POS	Peak	SAMP	Sample	NEG	Negative Peak
String Returned	Definition												
NORM	Normal												
AVER	Average (RMS)												
POS	Peak												
SAMP	Sample												
NEG	Negative Peak												
Couplings	When " Detector Select Auto/Man " on page 2402 is ON , the detector selected depends on the Trace (Average) type												
Preset	NORMal												
State Saved	Yes												
Range	AVERage NEGative NORMal POSitive SAMPle RMS												
Annotation	The four letter mnemonic for the detector appears in the trace window next to the trace it applies to												
Backwards Compatibility SCPI	<code>[:SENSe]:MONitor:DETEctor[:FUNCTION]</code> Applied to Trace 1 only												

Detector Select Auto/Man

Sets the Detector mode to Auto or Manual. In Auto, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When any detector is selected by the user, this toggles automatically set to Man (manual).

Remote Command	<code>[:SENSe]:MONitor:DETEctor:TRACe[1] 2 3:AUTO ON OFF 1 0</code> <code>[:SENSe]:MONitor:DETEctor:TRACe[1] 2 3:AUTO?</code>
Example	<code>:MON:DET:TRAC2:AUTO ON</code> <code>:MON:DET:TRAC2:AUTO?</code>
Couplings	When this function is ON , the "Detector" on page 2401 and "Trace Type" on page 2393 settings automatically align as follows: <ul style="list-style-type: none"> - "NORMal" with Clear Write - "AVERage" with AVERage - "POSitive (Peak)" with MAXHold - "NEGative (Peak)" with MINHold
Preset	ON
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe]:MONitor:DETEctor:AUTO</code> Applied to Trace 1 only

3.11 IQ Waveform Measurement

The IQ Waveform measurement is a time-domain measurement that lets you view the envelope, real and imaginary components of an RF or baseband signal. It is similar in many respects to the zero-span measurement in traditional spectrum analysis, but gives you direct access to the I/Q pairs of the signal, such as those which make up modern communications signals. The IQ Waveform measurement can also be used to perform general purpose power measurements to a high degree of accuracy.

You can look at the RF envelope (magnitude) of the signal, or open up an I/Q Waveform window, which shows the I and Q signal waveform voltage versus time, to disclose the voltages that comprise the complex modulated waveform of a digital signal.

IQ Waveform Measurement Commands

The following measurement commands are described in this section:

```
:CONFigure:WAVeform  
:CONFigure:WAVeform:NDEFault  
:INITiate:WAVeform  
:FETCh:WAVeform[n]?  
:MEASure:WAVeform[n]?  
:READ:WAVeform[n]?
```

The general functionality of `:CONFigure`, `:INITiate`, `:FETCh`, `:MEASure`, and `:READ` are described under "Measurement Control" on page 3413, in "Programming the Instrument" on page 3323.

Remote Command Results for the Waveform Measurement

For the `:FETCh|MEASure|READ` queries, the results returned depend on the `n` parameter value as follows:

<code>n</code>	Results Returned
0	Returns unprocessed I/Q trace data, as a series of trace point values, in volts. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values
1	Returns the following scalar results: <ol style="list-style-type: none">Sample Time is a floating point number representing the time between samples when using the trace queries (<code>n=0, 2</code>, and so forth)

n	Results Returned
2.	Mean Power is the mean power (in dBm). This is the power across the entire trace. If averaging is on, the power is for the latest acquisition
3.	Mean Power Averaged is the power (in dBm) for N averages if averaging is on. This is the power across the entire trace. If averaging is on, the power is for the latest acquisition. If averaging is off, the value of the mean power averaged is the same as the value of the mean power
4.	Number of samples is the number of data points in the captured signal. This number is useful when performing a query on the signal (i.e., when n=0, 2, etc.)
5.	Peak-to-mean ratio has units of dB. This is the ratio of the maximum signal level to the mean power. Valid values are only obtained with averaging turned off. If averaging is on, the peak-to-mean ratio is calculated using the highest peak value, rather than the displayed average peak value
6.	Maximum value is the maximum of the most recently acquired data (in dBm)
7.	Minimum value is the minimum of the most recently acquired data (in dBm)
2	Returns trace point values of the entire captured signal envelope trace data. These data points are floating point numbers representing the power of the signal (in dBm). There are N data points, where N is the number of samples. The period between the samples is defined by the sample time

3.11.1 Views

You can select the measurement view you want to use from the Mode/Measurement/View selector screen.

View Selection by name

You can program the View you want by name:

Remote Command	:DISP:WAVeform:VIEW[:SElect] RFENvelope IQ :DISP:WAVeform:VIEW[:SElect]?
Example	:DISP:WAV:VIEW RFEN :DISP:WAV:VIEW?
Preset	RFENvelope
State Saved	Saved in instrument state
Range	RF Envelope I/Q Waveform

View Selection by number

You can program the View you want by number:

3 5G NR Mode

3.11 IQ Waveform Measurement

Remote Command	<code>:DISPlay:WAVEform:VIEW:NSElect <integer></code> <code>:DISPlay:WAVEform:VIEW:NSElect?</code>
Example	<code>:DISP:WAV:VIEW:NSEL 1</code> <code>:DISP:WAV:VIEW:NSEL?</code>
Notes	View 1 is the RF Envelope View View 2 is the I/Q Waveform View
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

3.11.1.1 RF Envelope

Windows: "RF Envelope" on page 2407, "Metrics" on page 2408

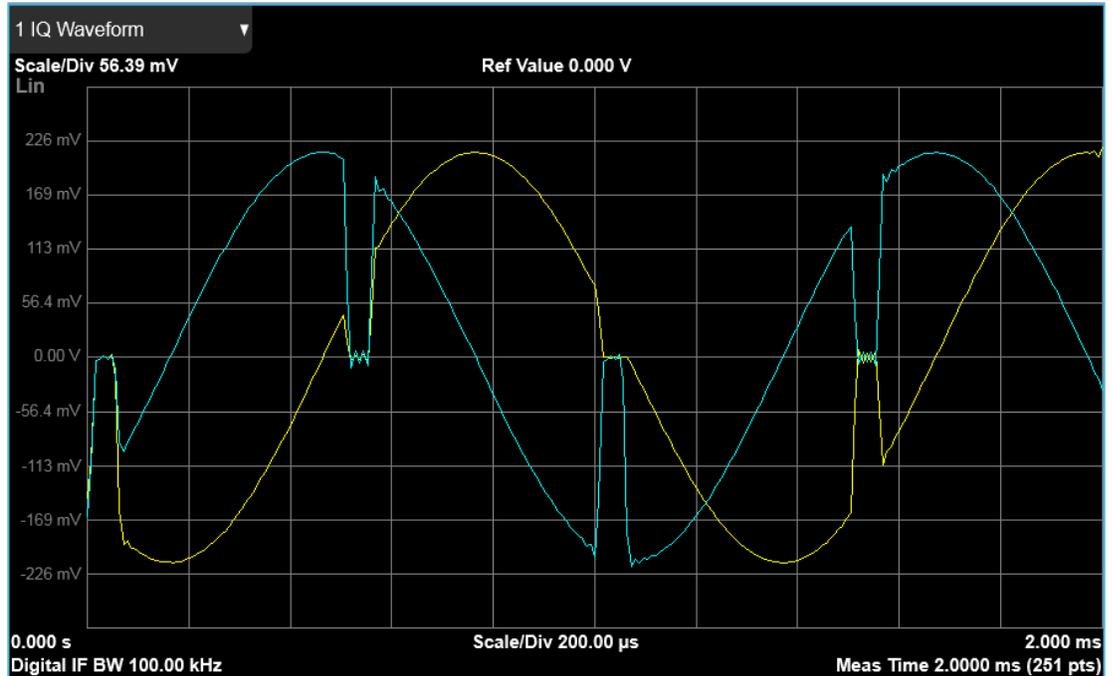

The RF Envelope View shows an RF envelope (magnitude) window and a metrics table showing the measured values for the mean power and peak-to-mean power.

3.11.1.2 I/Q Waveform

Windows: "I/Q Waveform" on page 2409

The I/Q Waveform View shows a window with I and Q voltages vs time. SCPI commands can also be used to query the I/Q pairs while in this View.

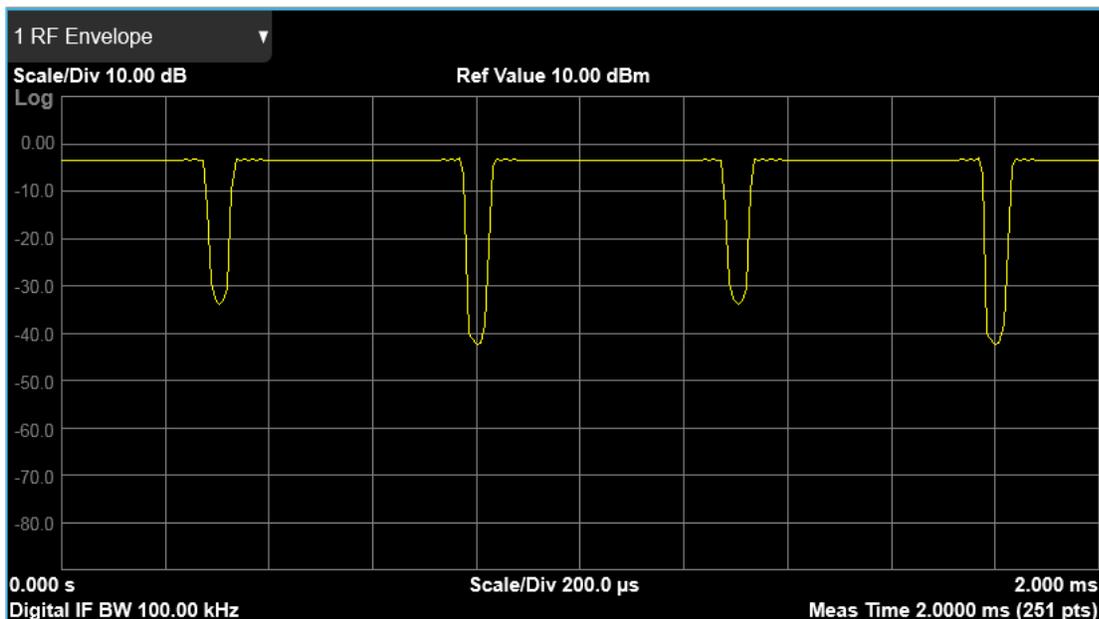

3.11.2 Windows

This section describes the windows available in the IQ Waveform measurement.

- ["RF Envelope" on page 2407](#)
- ["Metrics" on page 2408](#)
- ["I/Q Waveform" on page 2409](#)

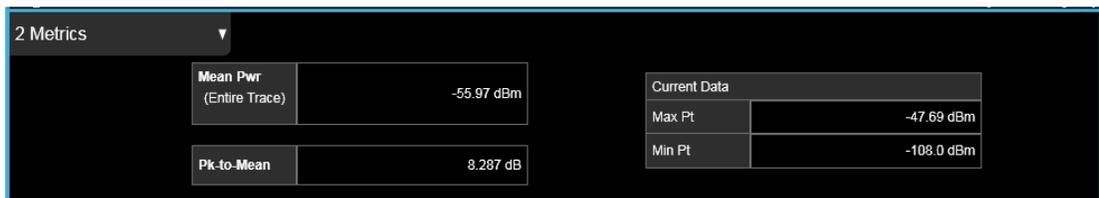

3.11.2.1 RF Envelope

The RF Envelope window displays an amplitude-vs time (time domain) graph of the envelope (magnitude) of the RF waveform:

3.11.2.2 Metrics

This text window shows an example of the measured values for the mean power and peak-to-mean power of the RF Envelope result of the waveform (time domain) measurements.

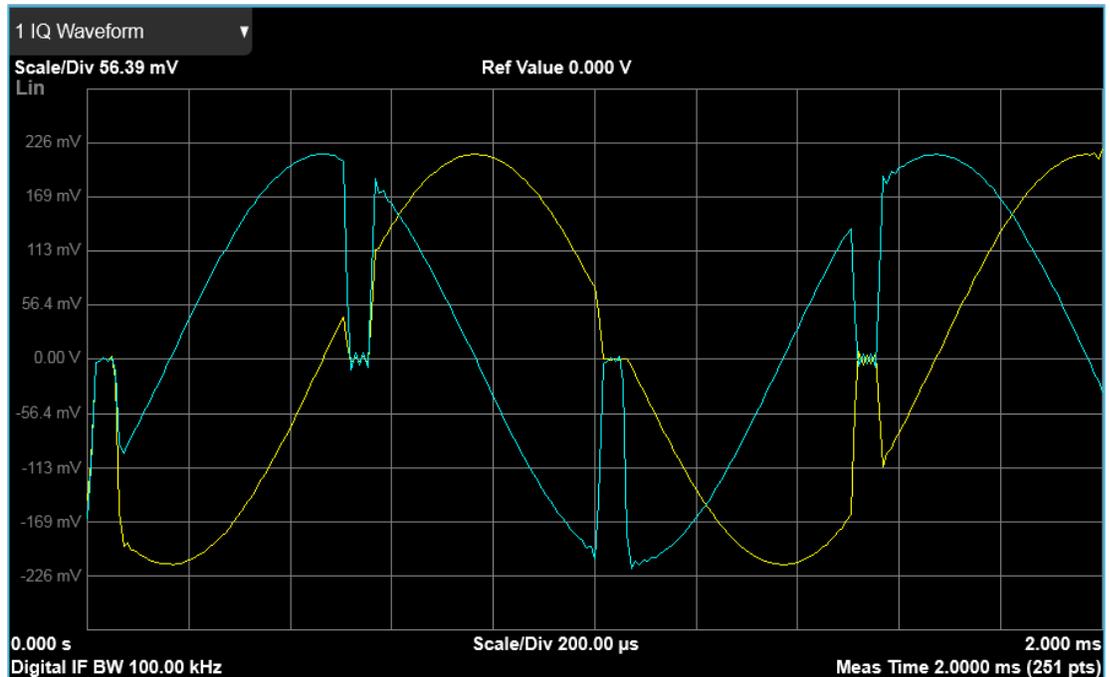

Numeric Results

Name	Type	Description	Unit	Format
Mean Pwr	Float64	The mean power (dBm). This is either the power across the entire trace, or the power between markers if the markers are enabled	dBm	XX.XX dBm
Pk-to-Mean	Float64	This is the ratio of the maximum signal level to the mean power	dB	XX.XX dB
Max Pt	Float64	The maximum of the most recently acquired data	dBm	XX.XX dBm
Min Pt	Float64	The minimum of the most recently acquired data	dBm	XX.XX dBm

3.11.2.3 I/Q Waveform

The I/Q Waveform window shows an amplitude-vs time (time domain) graph of the quadrature (I and Q) components of the RF waveform. This allows you to measure the phase of the waveform as well as its magnitude. The yellow trace is the I (real) component and the blue trace is the Q (imaginary) component.

3.11.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.11.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The functionality depends on the selected window. The reference line is at the top, center, or bottom of the graticule, depending on the value of "Ref Position" on page 2412.

RF Envelope

Remote Command	<code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <amptd></code> <code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:Y:RLEV -50 dBm</code>
Couplings	When "Auto Scaling" on page 2412 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to OFF
Preset	10.00 dBm
State Saved	Saved in instrument state
Min	-250.00 dBm
Max	250.00 dBm
Annotation	Ref <value> top of graph

IQ Waveform

Remote Command	<code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <voltage></code> <code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?</code>
Example	<code>:DISP:WAV:VIEW2:WIND:TRAC:Y:RLEV 25 V</code>
Couplings	When Auto Scaling is On (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to Off
Preset	0 V
State Saved	Saved in instrument state
Min	-250.00 V
Max	250.00 V
Annotation	Ref <value> top of graph

Scale/Div

Enables you to set the units per division of vertical scale in the logarithmic display. However, since "Auto Scaling" on page 2412 defaults to **ON**, this value is

automatically determined by the measurement result. When you set a value manually, **Auto Scaling** automatically changes to **OFF**.

The SCPI command and default parameters are dependent on whether the View is "RF Envelope" on page 2463 or "I/Q Waveform" on page 2464.

RF Envelope

Remote Command	<code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_amp1></code> <code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:Y:PDIV 5</code> <code>:DISP:WAV:VIEW:WIND:TRAC:Y:PDIV?</code>
Couplings	Coupled to Scale Range as follows Scale/Div = Scale Range/10 (number of divisions) When the Auto Scaling is On, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to Off
Preset	10.00 dB
State Saved	Saved in instrument state
Min	0.10 dB
Max	20.00 dB
Annotation	<value> dB/ left upper of graph

IQ Waveform

Remote Command	<code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <voltage></code> <code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code>
Example	<code>:DISP:WAV:VIEW2:WIND:TRAC:Y:PDIV 25mV</code> <code>:DISP:WAV:VIEW2:WIND:TRAC:Y:PDIV?</code>
Couplings	Coupled to Scale Range as follows Scale/Div = Scale Range/10 (number of divisions) When the Auto Scaling is On, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to Off
Preset	100.0 mV
State Saved	Saved in instrument state
Min	1.0 nV
Max	20 V
Annotation	<value> dB/ left upper of graph

Ref Position

Enables you to position the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

The SCPI command and default parameters are dependent on whether the View is "RF Envelope" on page 2463 or "I/Q Waveform" on page 2464.

RF Envelope

Remote Command	<code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP CENTER BOTTom</code> <code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:Y:RPOS CENT</code> <code>:DISP:WAV:VIEW:WIND:TRAC:Y:RPOS?</code>
Preset	TOP
State Saved	Saved in instrument state
Range	Top Center Bottom
Annotation	> and < are displayed both side of graph to indicate Reference Position

IQ Waveform

Remote Command	<code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP CENTER BOTTom</code> <code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?</code>
Example	<code>:DISP:WAV:VIEW2:WIND:TRAC:Y:RPOS CENT</code> <code>:DISP:WAV:VIEW2:WIND:TRAC:Y:RPOS?</code>
Preset	CENT
State Saved	Saved in instrument state
Range	Top Center Bottom
Annotation	> and < are displayed both side of graph to indicate Reference Position

Auto Scaling

Enables you to toggle the Auto Scaling function On or Off. When the **Restart** front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results.

Remote Command	<code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 1 OFF ON</code> <code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:Y[:SCALe]:COUPle?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:WAV:VIEW:WIND:TRAC:Y:COUP?</code>
Couplings	When Auto Scaling is On, and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results. When you change a value of Scale/Div , Ref Value , or Scale Range , Auto Scaling automatically changes to OFF.
Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON

3.11.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations "](#) on page 2413
- See ["Single-Attenuator Configuration "](#) on page 2414

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

This tab is only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does not appear in:

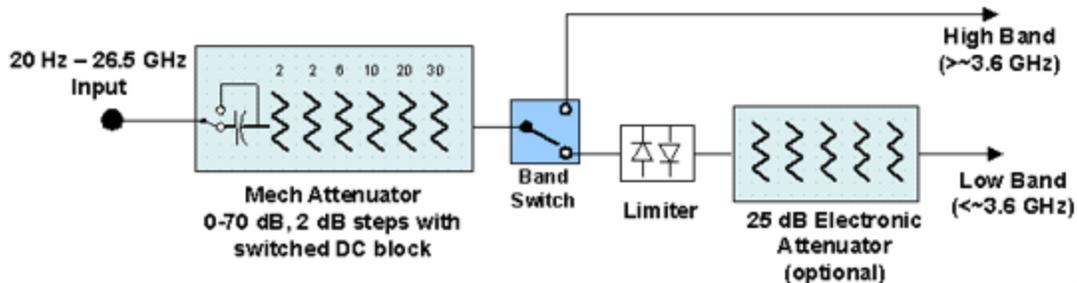

- VXT models SP900B/10A/11A

This tab also does not appear in UXM. In UXM all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

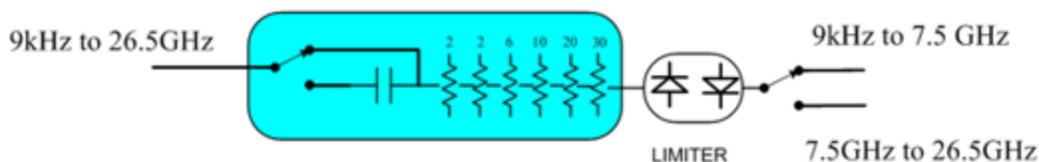

Dependencies	In measurements that support the I/Q inputs, this tab is unavailable when I/Q is the selected input, and is replaced by the Range tab in that case
--------------	---

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

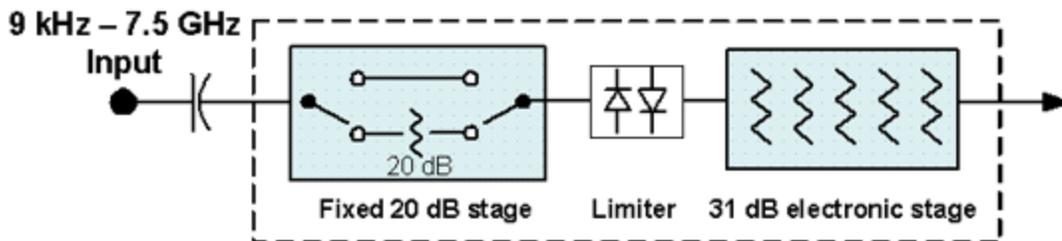

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

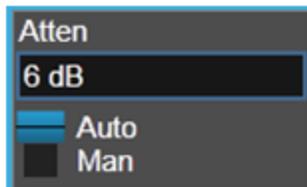

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in SP900S, when the RF input is selected and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator at the beginning of the RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, and RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 2568 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF , and the Input Port is RF Input 2 , and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows: <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten In the Amplitude , " Y Scale " on page 2562 menu, and the Atten Meas Bar dropdown menu panel, a

summary is displayed as follows:

“Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten

“Total Atten above 50 GHz” followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

This control is labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

This control lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "[Attenuator Configurations and Auto/Man](#)" on page 2418

Remote Command	<pre>[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl> [:SENSe]:POWer[:RF]:ATTenuation? [:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1 [:SENSe]:POWer[:RF]:ATTenuation:AUTO?</pre>
Example	<pre>:POW:ATT 20</pre> <p>Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual <pre>:POW:ATT:AUTO ON</pre> <p>Turn Auto Mech Atten ON</p> </p>
Dependencies	<p>Some measurements do not support the Auto setting of "Mech Atten" on page 2416. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available</p> <p>In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 2571</p> <p>See "Attenuator Configurations and Auto/Man" on page 2418 for more information on the Auto/Man</p>

	<p>functionality</p> <p>:POW:ATT:AUTO is only available in measurements that support Mech Atten Auto, such as Swept SA</p>
Couplings	<p>If the RF Input Port is the RF Input:</p> <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In the SP900S, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 2416 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5GHz. So, when the frequency is changed from below 7.5GHz to above 7.5GHz, the attenuation setting will be changed to a multiple of 10dB which will be no smaller than the previous setting. For example, 4dB attenuation will be changed to 10dB</p>
Preset	<p>The preset for Mech Attenuation is "Auto"</p> <p>The Auto value of attenuation is 10 dB</p> <p>ON</p>
State Saved	Saved in instrument state
Min	<p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</p>
Max	<p>CXA Option 503 or 507: 50 dB</p> <p>EXA: 60 dB</p> <p>All other models: 70 dB</p> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as</p> <p>Atten: <total> dB (e<elec>)</p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p>

Dual-Attenuator configuration:

Atten: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB

Single-Attenuator configuration:

A: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)

When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described in ["Y Scale" on page 2562](#), there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using ["Mech Atten" on page 2416](#) (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation. See ["Elec Atten" on page 2571](#) for more on “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. This control does not appear in Single-Attenuator configurations, as the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an Enable/Disable toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the “Enable” position.

For more details about the Electronic Attenuator, see ["More Information " on page 2420](#)

Remote Command	<pre>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1> [:SENSe]:POWer[:RF]:EATTenuation? [:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1 [:SENSe]:POWer[:RF]:EATTenuation:STATe?</pre>
Example	<pre>:POW:EATT 10 :POW:EATT? :POW:EATT:STAT ON :POW:EATT:STAT?</pre>
Notes	Electronic Attenuation's specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	<p>This control only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single-Attenuator configuration, as in the Single-Attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments and set a “soft” attenuation as described in . The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Atten control or :POW:ATT and affects the total attenuation displayed on the Atten control and the Meas Bar</p> <p>The electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz 0-3GHz, depending on the model). If the low band ranges from 0-3.6GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable will be sent</p> <p>If both of the above are true, pressing the control will generate error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and the Internal Preamp is unavailable</p>

3 5G NR Mode
3.11 IQ Waveform Measurement

If the LNA is on, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed-out. This coupling works in the following modes/measurements:

- Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes
- Transmit On|Off Power measurement in 5GNR Mode
- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 2420
Preset	0 dB OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "[Using the Electronic Attenuator: Pros and Cons](#)" on page 2421 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "[Attenuator Configurations and Auto/Man](#)" on page 2570

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the

odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under ["Pre-Adjust for Min Clipping" on page 2575](#).

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode

Restart Meas on Adjust Atten

Toggles the force restart switch for the ["Adjust Atten for Min Clipping" on page 2574](#) function.

When **ON**, pressing **Adjust Atten for Min Clipping**, or sending `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` restarts the measurement and then executes the function.

When **OFF**, pressing the control or sending the command neither restarts the measurement nor executes the function until you restart or continue averaging. In this case, pressing the control generates the following advisory message:

"Adjust Atten is deferred until "Restart" or "Continue Averaging" is executed"

This message is *not* generated if the command is sent.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:REStart OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:REStart?</code>
Example	<code>:POW:RANG:OPT:REST OFF</code> <code>:POW:RANG:OPT:REST?</code>
Dependencies	This parameter is available only in the measurements that support continuous averaging in 5G NR
Preset	ON
State Saved	Saved

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	COMBined
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 2574 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 2424

Selection	Example	Note
Off	<code>:POW:RANGe:OPT:ATT</code>	This is the default setting

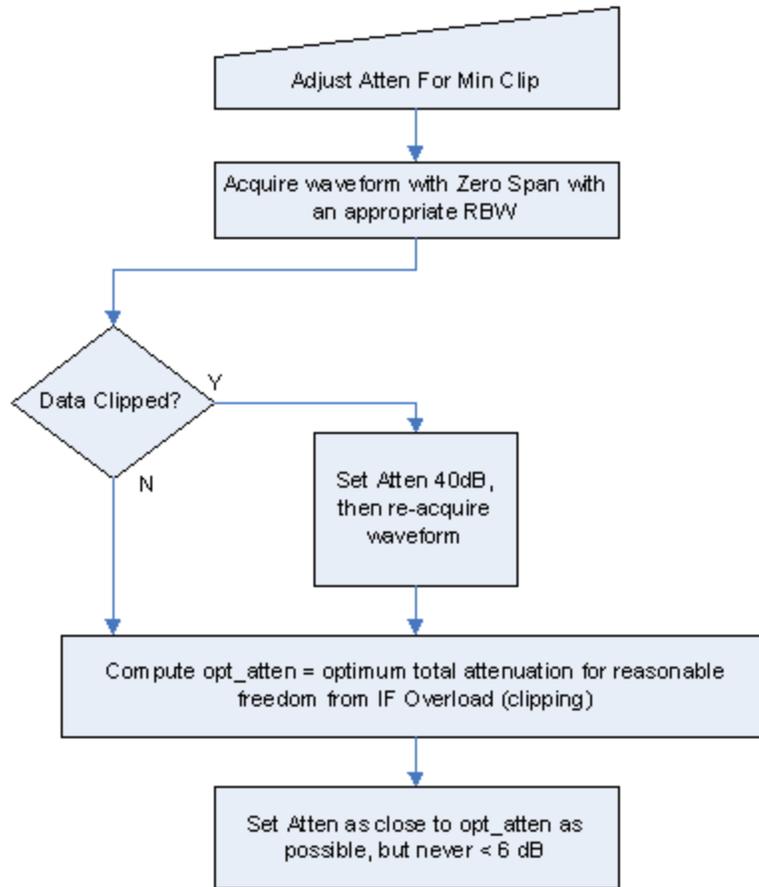

3 5G NR Mode
3.11 IQ Waveform Measurement

Selection	Example	Note
	OFF	
Elec Atten Only	:POW:RANG:OPT:ATT ELEC	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Mech + Elec Atten	:POW:RANG:OPT:ATT COMB	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging
Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECtrical COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?	
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?	
Notes	<p>The parameter option ELECtrical sets this function to ON in Single-Attenuator models</p> <p>The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query</p> <p>For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined</p>	
Dependencies	<p>This control only appears in Dual-Attenuator models with an Electronic Attenuator installed</p> <p>In instruments with Dual-Attenuator model, when "Elec Atten" on page 2571 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 2423 is grayed-out</p> <p>This control does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements</p> <p>For the Waveform measurement, this control is available only in 5G NR Mode</p>	
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC	
State Saved	Saved in instrument state	
Range	Dual-Attenuator models: Off Elec Atten Only Mech + Elec Atten Single-Attenuator models: Off On	
Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF	
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?	

Adjustment Algorithm

The algorithms for the adjustment are documented below:

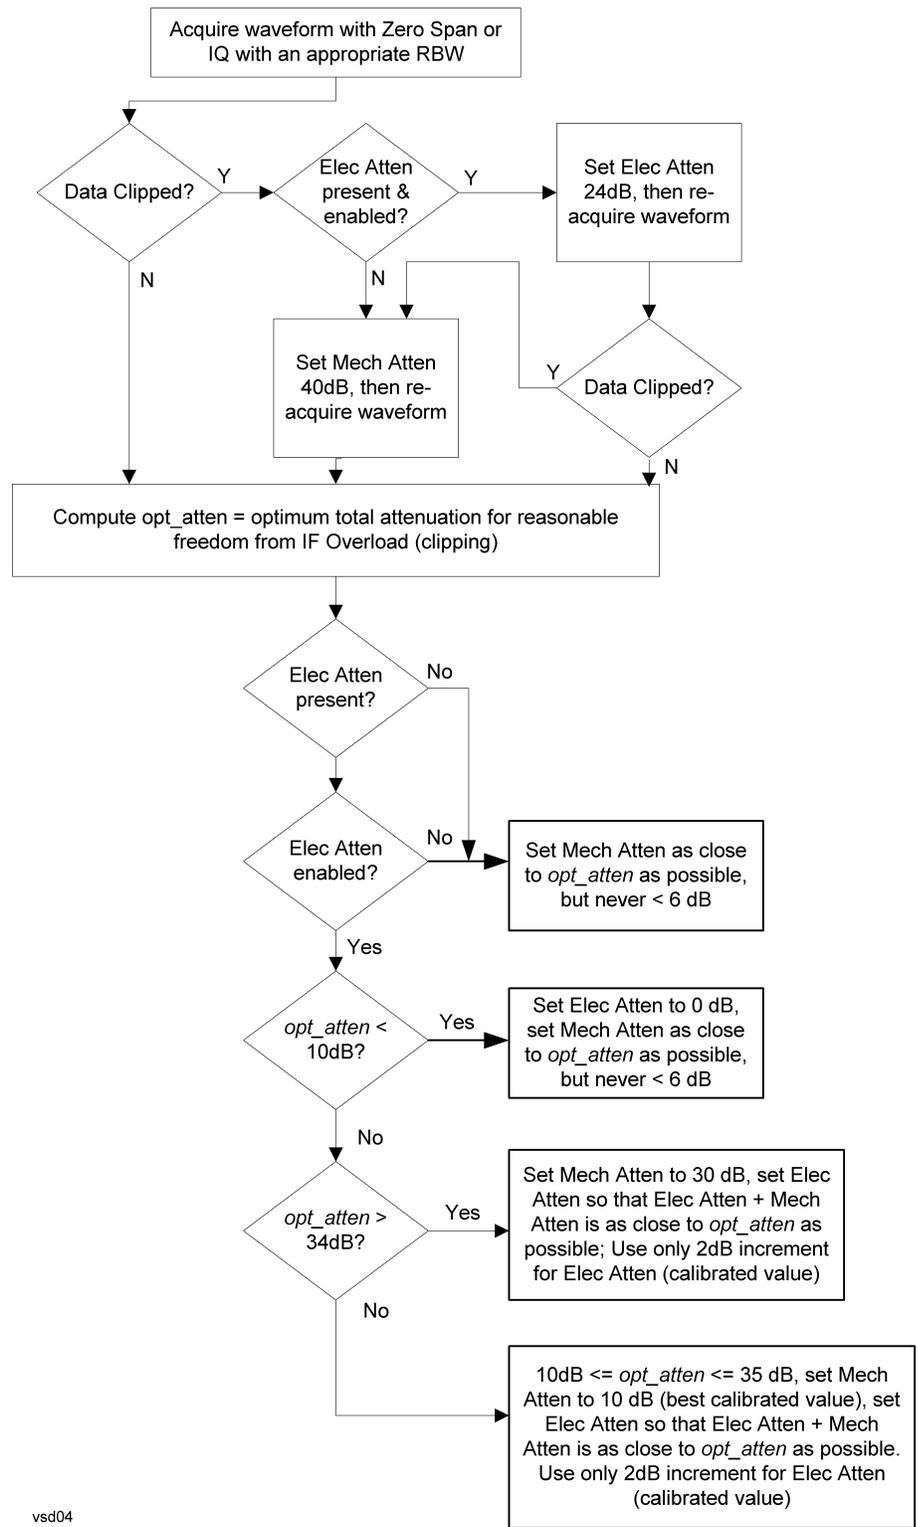

Single-Attenuator Models

Dual-Attenuator models

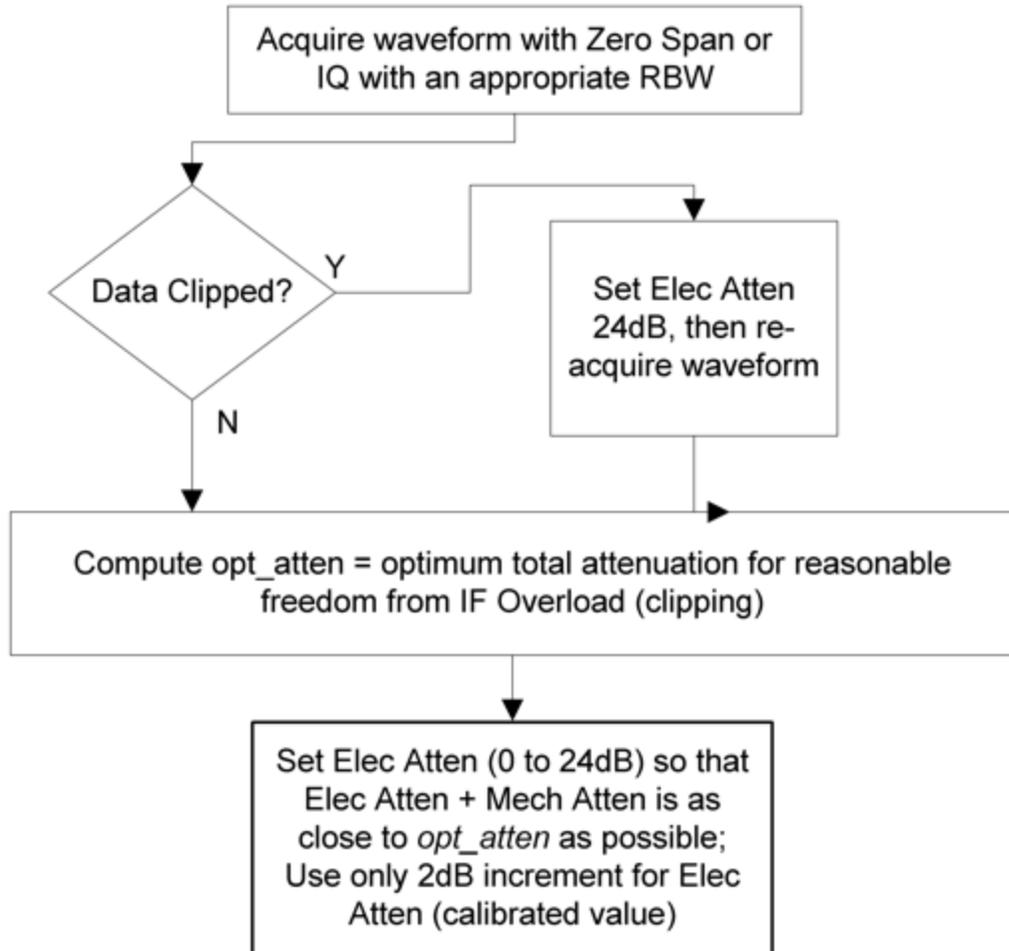

"Adjust Atten for Min Clipping" on page 2574 or "Pre-Adjust for Min Clipping" on page 2423 selection is Mech + Elec Atten:

3 5G NR Mode
3.11 IQ Waveform Measurement

"Pre-Adjust for Min Clipping" on page 2423 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

This control is labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`
`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`

Example `:POW:ATT:STEP 2`

:POW:ATT:STEP?	
Notes	This feature has a toggle choice from the front panel, but it takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "[Max Mixer Lvl Rules](#)" on page 2580.

Remote Command	<code>[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real></code> <code>[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?</code>
Example	<code>:POW:MIX:RANG -15 dBm</code> <code>:POW:MIX:RANG?</code>
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Allows you to optimize the Max Mixer Level setting for certain kinds of measurements.

- **NORMa1** – The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the **Reference Level** is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression will be negligible
- **TOI** – Allows a range of settings of the "Max Mixer Level" on page 2580, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size
- **COMPression** – Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies. Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMa1	Normal – balance TOI, noise, and compression	–10	–50	0
TOI	TOI-limited dynamic range	–25	–50	–10
COMPression	Compression-limited dynamic range	–3	–10	+30

Remote Command	<code>[:SENSe] :POWer [:RF] :MIXer :RULEs NORMa1 TOI COMPression</code> <code>[:SENSe] :POWer [:RF] :MIXer :RULEs?</code>
Example	<code>:POW:MIX:RULE:COMP</code>
Dependencies	Only appears in Swept SA and RTSA
Preset	NORM

3.11.3.3 Range (Baseband Input models)

This tab is only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. It replaces the Attenuation tab in that case.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs"

State Saved No

Range Auto/Man

The Auto setting for Range causes the range to be set based on the Y Scale settings. When Range is "Auto", the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If Auto is not supported in the current measurement, this control is grayed-out displaying "Man", and **MAN** is returned to a SCPI query, but this does *not* change the Auto/Man setting for Range. When you switch to a measurement that supports Auto, it goes back to Auto if it was previously in Auto mode.

Remote Command `[:SENSe] :VOLTage :IQ :RANGe :AUTO OFF | ON | 0 | 1`
`[:SENSe] :VOLTage :IQ :RANGe :AUTO?`

Example Put the I Range and Q Range in manual
`:VOLT :IQ :RANG :AUTO OFF`
`:VOLT :IQ :RANG :AUTO?`

Dependencies If Auto is not supported, sending the SCPI command generates an error

Couplings When in Auto, both I Range and Q Range are set to the same value, computed as follows:
Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: $Y_{Max} = \max(\text{abs}(\text{top}), \text{abs}(\text{bottom}))$

	The I Range and Q Range are then set to Y_{Max}
Preset	ON
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#" This is an alternate form of the command to match the POWer form of the I Range and Q Range SCPI.
Remote Command	<code>[:SENSE]:POWer:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSE]:POWer:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:POW:IQ:RANG:AUTO OFF</code> <code>:POW:IQ:RANG:AUTO?</code>
Notes	<code>:POW:IQ:RANG:AUTO</code> is an alternate form of <code>:VOLT:IQ:RANG:AUTO</code> , to maintain consistency with I Range and Q Range, which support both the POWer and VOLTage forms of the command
Preset	ON
Range	Auto Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	<code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak <code>:VOLT:IQ:RANG 0.5 V</code> <code>:VOLT:IQ:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When " Q Same as I " on page 2586 is On, the I Range value will be copied to " Q Range " on page 2584 Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#"

The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples:

"Rng: 1 V Peak" the I Range is 1 V Peak

"Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote Command	<code>[:SENSe] :POWer :IQ [:I] :RANGe [:UPPer] <amp;lt;1></code> <code>[:SENSe] :POWer :IQ [:I] :RANGe [:UPPer] ?</code>
Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω , and to 1.0 V Peak when Reference Z is 75 Ω <code>:POW:IQ:RANG 4 dBm</code> <code>:POW:IQ:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω : 10, 4, -2, -8 75 Ω : 8.2, 2.2, -3.8, -9.8 600 Ω : -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "**I Range**" on page 2583 determines both I and Q channel range settings.

Remote Command	<code>[:SENSe] :VOLTage :IQ :Q :RANGe [:UPPer] <voltage></code> <code>[:SENSe] :VOLTage :IQ :Q :RANGe [:UPPer] ?</code>
Example	Set the Q Range to 0.5 V Peak: <code>:VOLT:IQ:Q:RANG 0.5 V</code> <code>:VOLT:IQ:Q:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, " I Range " on page 2583

	determines both I and Q channel range settings
Couplings	When " Q Same as I " on page 2586 is On, the " I Range " on page 2583 value is copied to Q Range and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSE] :POWer :IQ :Q :RANGe [:UPPer] <amp;pl></code> <code>[:SENSE] :POWer :IQ :Q :RANGe [:UPPer] ?</code>
Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω: <code>:POW:IQ:Q:RANG 4 dBm</code> <code>:POW:IQ:Q:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form of the command The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	<code>[:SENSe] :VOLTage POWer : IQ : MIRRored OFF ON 0 1</code> <code>[:SENSe] :VOLTage POWer : IQ : MIRRored ?</code>
Example	Turn off the mirroring of I Range to Q Range <code>:VOLT : IQ : MIRR OFF</code> <code>:POW : IQ : MIRR OFF</code>
Couplings	When ON , the "I Range" on page 2583 value is mirrored (copied) to the "Q Range" on page 2584
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

3.11.3.4 Range (Non-attenuator models)

This tab is only available for Keysight's modular signal analyzers and certain other Keysight products. Examples include:

- VXT

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe] : POWer [: RF] : RANGe <real></code> <code>[:SENSe] : POWer [: RF] : RANGe ?</code>
Example	<code>:POW : RANG 10 dBm</code> <code>:POW : RANG ?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency

	The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe] : POWer [:RF] : RANGe : OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements

Restart Meas on Adjust Range

This control is the same as ["Restart Meas on Adjust Atten" on page 2574](#) under ["Attenuation" on page 2565](#).

Pre-Adjust for Min Clipping

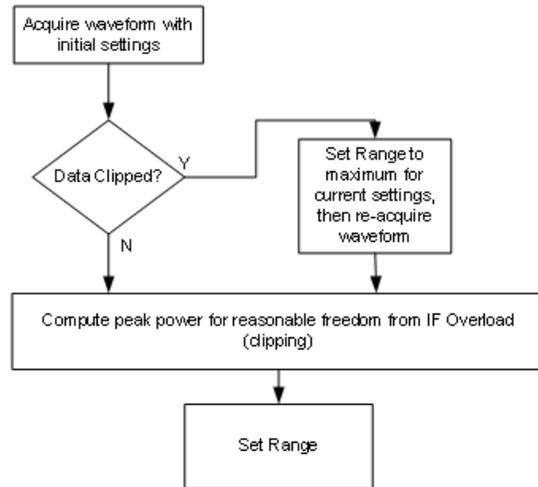

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe] : POWer [:RF] : RANGe : OPTimize : ATTenuation OFF ON ELEctrical COMBined</code> <code>[:SENSe] : POWer [:RF] : RANGe : OPTimize : ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELEctrical , COMBined , and ON) are honored and all are mapped to ELEctrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping

State Saved Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 2586 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Applications (Modes) show the current value of Peak-to-Average ratio on the control. However, some applications do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>
Example	<code>:POW:RANG:PAR 12 dB</code>
Notes	In some Applications (Modes) this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	Does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models SP900B/11A: 0
State Saved	0 Saved in instrument state
Min	0 dB

Max	20 dB
	VXT Models SP900B/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 2588. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe] :POWer [:RF] :RANGe :MIXer :OFFSet <real></code> <code>[:SENSe] :POWer [:RF] :RANGe :MIXer :OFFSet ?</code>
----------------	---

Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>
---------	---------------------------------------

Preset	0 dB
--------	------

State Saved	Saved in instrument state
-------------	---------------------------

Min	-35 dB
	VXT Models SP900B/11A: -34

Max	∞ dB
-----	------

3.11.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, this tab only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Models M9420/21A. It also does not appear in UXM.

This tab *does* appear in VXT Models SP900B/11A because the Software Preselection control is in this tab, and VXT Models SP900B/11A implement a version of Software Preselection.

Presel Center

Pressing this control adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but

3 5G NR Mode
3.11 IQ Waveform Measurement

outside the frequency range between Start Freq and Stop Freq, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "[Preselector Adjust](#)" on page 2591 will change to reflect the new preselector tuning.

A number of considerations should be observed to ensure proper operation. See "[Proper Preselector Operation](#)" on page 2438.

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	Note that the rules outlined above under the control description apply for the remote command as well as the key. The result of the command is dependent on marker position, etc. Any message shown by the control press is also shown in response to the remote command
Dependencies	Does not appear in CXA-m Does not appear in VXT Models SP900B/11A Grayed-out if the microwave preselector is off if the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken <ul style="list-style-type: none"> - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blank in models that do not include a preselector, such as option 503. If the remote command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering reads out on the " Preselector Adjust " on page 2591 control
Status Bits/OPC dependencies	When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering will be attempted, and an advisory message generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering will be attempted in that range and a message will be generated

Preselector Adjust

Allows you to manually adjust the preselector filter frequency to optimize its response to the signal of interest. This function is only available when "**Presel Center**" on page 2589 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe] :POWer [:RF] :PADJust <freq></code> <code>[:SENSe] :POWer [:RF] :PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control reads out to 0.1 MHz resolution
Dependencies	<ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models SP900B/11A - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The Preselector Adjust value set by " Presel Center " on page 2589, or by manually adjusting

	Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code>
Notes	The command has no effect, and the query always returns <code>MWAVe</code>
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	<code>:POW:GAIN OFF</code>	
Low Band	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code>	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code>	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency** for Low Band, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as SP900S& SP900P), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, **N/A** is displayed in the square brackets for Low Band.

Remote Command	<pre>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL [:SENSe]:POWer[:RF]:GAIN:BAND? [:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1 [:SENSe]:POWer[:RF]:GAIN[:STATe]?</pre>
Example	<pre>:POW:GAIN:BAND LOW :POW:GAIN:BAND? :POW:GAIN OFF :POW:GAIN?</pre>
Dependencies	<p>Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown</p> <p>Does not appear in VXT Models SP900B/11A/15A/16A</p> <p>If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code>, and an "Option not installed" message is generated</p> <p>Not available when the electronic/soft attenuator is enabled</p>
Preset	<pre>LOW OFF</pre>
State Saved	Saved in instrument state
Annotation	<p>When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz"</p> <p>When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)</p>

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to **"Internal Preamp"** on page 2592. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

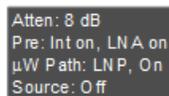

For best possible sensitivity, **LNA** can be turned on *together* with **"Internal Preamp"** on page 2592, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see **"More Information"** on page 2442

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models SP900B/16A Does not appear in VXT models SP900B/10A/11A May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

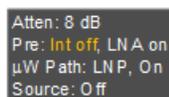

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μ W Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μ W Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μ W Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μ W Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μ W Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 2447
μ W Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 2449
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 2450

Remote Command [:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL
[:SENSe]:POWer[:RF]:MW:PATH?

Example :POW:MW:PATH LNP
Enables the Low Noise path

: POW: MW: PATH?

Notes If "**Presel Center**" on page 2589 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **μW Path Control**

The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable**. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled

Alignment switching ignores the settings in this menu, and restores them when finished

Dependencies Does not appear in CXA-m, VXT Models SP900B/11A, nor in BBIQ and External Mixing

- The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed
- The **μW Preselector Bypass** selection does not appear unless Option MPB is present and licensed
- The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP

In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated

Low Noise Path Enable and **Full Bypass Enable** are grayed-out if the current measurement does not support them

Low Noise Path Enable and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"

Preset	Mode	Value
	IQ Analyzer	MPB option present and licensed: MPB
	Pulse	MPB option not present and licensed: STD
	Avionics	
	All other Modes	STD
	-	

State Saved Save in instrument state

Range Standard Path | Low Noise Path Enable | μW Presel Bypass | Full Bypass Enable

Annotation In the Meas Bar, if the Standard path is chosen, it says:
 μW Path: Standard
 If Low Noise Path is enabled but the LNP switch is not thrown, it shows:
 μW Path: LNP,Off
 If the Low Noise Path is enabled and the LNP switch IS thrown, it shows:
 μW Path: LNP,On

If the preselector is bypassed, it says:

μW Path: Bypass

If Full Bypass Enable is selected but the LNP switch is not thrown, it shows:

μW Path: FByp,Off

If Full Bypass Enable is selected and the LNP switch IS thrown, it shows:

μW Path: FByp,On

μW Path Control Auto [Mode: VMA, WLAN, NR5G, CQM]

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **μW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When μW Path Control is in Auto
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Range	<code>ON OFF</code>

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

3 5G NR Mode

3.11 IQ Waveform Measurement

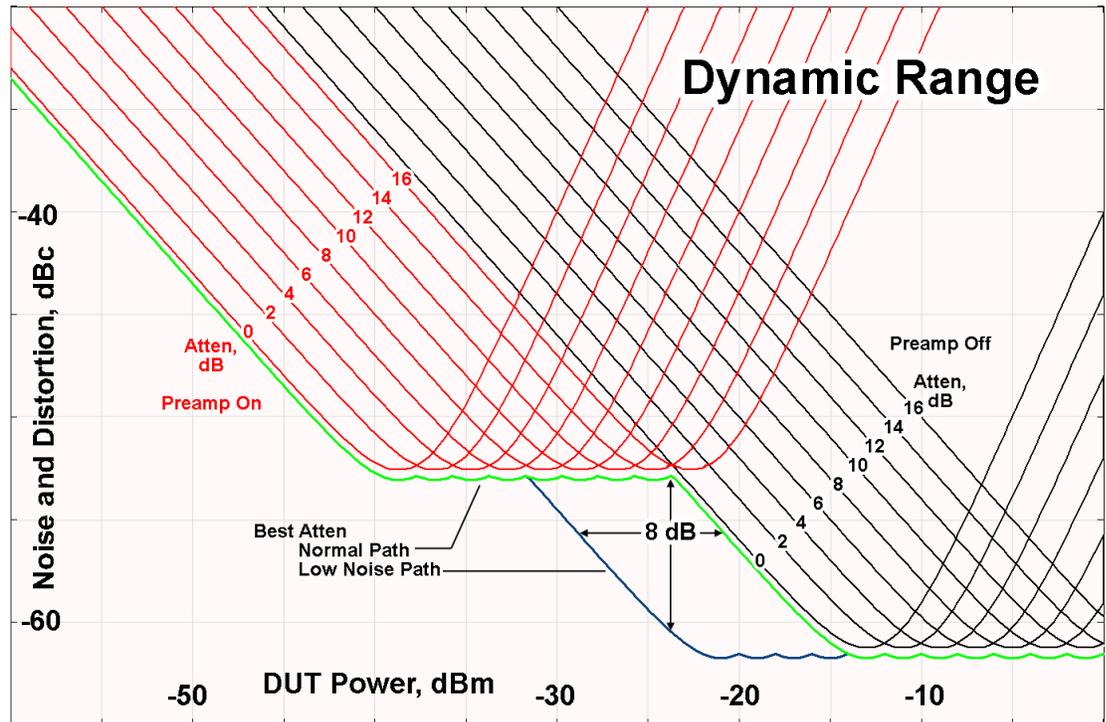

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around -30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage

when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
 - the start frequency is above 3.5 GHz and
 - the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 2562 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Microwave Preselector Bypass Backwards Compatibility

Example	<code>:POW:MW:PRES OFF</code> Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSE] :POWer [:RF] :MW:PRESelector [:STATe] ON OFF 0 1</code> <code>[:SENSE] :POWer [:RF] :MW:PRESelector [:STATe] ?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 2594.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 2594 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, wherein both the Preamp and the Microwave Preselector are bypassed. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 2562 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH:AUTO:FULL ON OFF 1 0</code> <code>[:SENSe]:POWer[:RF]:MW:PATH:AUTO:FULL?</code>

Dependencies	Only appears if Option FBP is installed, and in the following measurements <ul style="list-style-type: none"> - 5GNR Modulation Analysis and IQ Waveform - WLAN IQ Waveform - Channel Quality Group Delay
Preset	OFF
State Saved	Saved in instrument state

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

SP900S

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The

specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In SP900S, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in SP900S, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

SP900S+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For SP900S+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for SP900S+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models SP900B/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models SP900B/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:STATE 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPResel:STAT?</code>						
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>						
Dependencies	Only appears in SP900S, SP900S+V2050A, and VXT models SP900B/11A. Does not appear in all measurements						
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state						
Preset	<table border="1"> <tr> <td>SP900S</td> <td>OFF</td> </tr> <tr> <td>SP900S+V3050A</td> <td>ON</td> </tr> <tr> <td>SP900B/11A</td> <td>ON</td> </tr> </table>	SP900S	OFF	SP900S+V3050A	ON	SP900B/11A	ON
SP900S	OFF						
SP900S+V3050A	ON						
SP900B/11A	ON						
State Saved	Saved in instrument state						

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in SP900Sand SP900S+V3050A. Only appears in measurements that use the Swept

	method	
	When " Software Preselection " on page 2604 is disabled, this control is grayed-out. The grayout message is "Unavailable unless SW Presel enabled"	
Preset	SP900S	ADVanced
	SP900S+V3050A	NORMa1
State Saved	Saved in instrument state	

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow** – a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe] :POWer [:RF] :SWPResel :BW NORMa1 NARRow</code> <code>[:SENSe] :POWer [:RF] :SWPResel :BW?</code>	
Example	<code>:POW:SWPR:BW NARR</code>	
Dependencies	Only appears in SP900S and SP900S+V3050A. Only appears in measurements that use the Swept method When " Software Preselection " on page 2604 is disabled, this control is grayed-out. The grayout message is "Unavailable unless SW Presel enabled" For SP900S+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled	
Preset	SP900S	NORMa1
	SP900S+V3050A	NARRow
State Saved	Saved in instrument state	

High Freq Prefilter

Lets you set the state of Prefilter for Center Frequencies above 1310 MHz.

In VXT Models SP900B/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	For example, to enable High Freq Prefilter in IQ Analyzer Mode: For the Complex Spectrum Measurement: <code>:SPEC:PFIL ON</code> For the IQ Waveform Measurement: <code>:WAV:PFIL ON</code>
Dependencies	Only appears in VXT models SP900B/11A with center frequency above 1310 MHz
Preset	See " Prefilter Presets " on page 2456 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF

SAN	SA	ON
HARM	SA	ON

3.11.4 BW

Opens the **BW** (Bandwidth) menu. The Digital IF BW functions control filter bandwidth and filter type. There are two filter types: Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.11.4.1 Settings

Contains the basic Bandwidth functions. It is the only tab under Bandwidth.

Digital IF BW

Sets the Digital IF (formerly Info BW) bandwidth of the instrument. When in Auto, it is set to the value that covers carriers set by carrier configuration.

Remote Command	<pre>[:SENSe] :WAVeform :DIF :BANDwidth <freq> [:SENSe] :WAVeform :DIF :BANDwidth? [:SENSe] :WAVeform :DIF :BANDwidth :AUTO ON OFF 1 0 [:SENSe] :WAVeform :DIF :BANDwidth :AUTO?</pre>						
Example	<pre>:WAV :DIF :BAND 1kHz :WAV :DIF :BAND? :WAV :DIF :BAND :AUTO 0 :WAV :DIF :BAND :AUTO?</pre>						
Notes	Auto/Man is available only for 5G NR, LTE, LTE TDD, LTEAFDD, LTEA TDD						
Dependencies	For applications that have the IF Path Selection menu, such as the BASIC mode:						
	<table border="1"> <thead> <tr> <th>IF Path</th> <th>Maximum Value Criteria</th> </tr> </thead> <tbody> <tr> <td>Auto State</td> <td></td> </tr> <tr> <td>OFF</td> <td>The maximum value depends on which IF Path is currently selected</td> </tr> </tbody> </table>	IF Path	Maximum Value Criteria	Auto State		OFF	The maximum value depends on which IF Path is currently selected
IF Path	Maximum Value Criteria						
Auto State							
OFF	The maximum value depends on which IF Path is currently selected						

3 5G NR Mode
 3.11 IQ Waveform Measurement

IF Path Auto State	Maximum Value Criteria
	<p>If 10 MHz, 25 MHz, 40 MHz, 85 MHz, 125 MHz, 140 MHz or 160 MHz, 255 MHz, or 510 MHz paths are selected, the maximum value of this parameter is 10, 25, 40, 85, 125, 140 or 160 MHz, 255 MHz, or 510 MHz respectively</p> <hr/> <p>ON The maximum value is the maximum Digital IF BW available in the instrument, regardless of the current IF Path Selection</p> <p>For example, if the instrument has the options B25, B40, and B1X installed, the maximum available Digital IF BW of the instrument is 160 MHz. Thus, if IF Path Auto is ON and IF Path Selection is 25 MHz, the maximum Digital IF BW is <i>not</i> limited to 25 MHz, but is 160 MHz</p>
Preset	<p>GSM/EDGE: 510 kHz LTE, LTE-TDD, LTE-AFDD, LTE-A-TDD, 5G NR: Automatically calculated WLAN: Hardware Dependent</p> <ul style="list-style-type: none"> - No option = 10 MHz - Option B25 = 25 MHz - Option B40: <ul style="list-style-type: none"> - if Radio Std is 802.11a/b/g/n/ac/ax/be (20 MHz) = 25 MHz - if Radio Std is 802.11n/ac/ax/be (40 MHz) = 40 MHz - if Radio Std is 802.11ac/ax/be (80 MHz) = 80 MHz - if Radio Std is 802.11ac/ax/be (160 MHz) = 160 MHz - if Radio Std is 802.11be (320 MHz) = 320 MHz - Option B1X: <ul style="list-style-type: none"> - if Radio Std is 802.11ac(80 MHz) = 80 MHz - Option B1Y: <ul style="list-style-type: none"> - if Radio Std is 802.11ac(160 MHz) = 160 MHz <p>All other Modes: 100 kHz</p> <p>ON</p>
State Saved	Saved in instrument state
Min	All others: 10 Hz
Max	<p>All others: Hardware Dependent: RF Input:</p> <ul style="list-style-type: none"> - No Option = 10 MHz

-
- Option B25 = 25 MHz
 - Option B40 = 40 MHz
 - Option B85 = 85.0 MHz
 - Option B1A = 125.0 MHz
 - Option B1X = 140 MHz
 - Option B1Y = 160 MHz
 - Option B2X = 255 MHz
 - Option B5X = 510 MHz

VXT models SP900B/11A:

- M941xA-B3X = 300 MHz
- M941xA-B6X = 600 MHz
- M941xA-B12 = 1.2 GHz

VXT models SP900B:

- SP900B-B4X = 400 MHz
- SP900B-B8X =

800 MHz - SP900B-B12

I/Q Input

- No Option = 10 MHz per channel (20 MHz for I+jQ)
- Option B25 = 25 MHz per channel (50 MHz for I+jQ)
- Option S40 = 40 MHz per channel (80 MHz for I+jQ)

Backwards	<code>[:SENSe] :WAVeform :BANDwidth [:RESolution]</code>
Compatibility SCPI	<code>[:SENSe] :WAVeform :BWIDth [:RESolution]</code>

Filter Type

Enables you to select the type of bandwidth filter that is used.

Besides the Gaussian filter shape, a variety of other filter types are available, with variable alpha settings for maximum control over the filter shape.

Remote Command	<code>[:SENSe] :WAVeform :DIF :FILTer :TYPE GAUSSian FLATtop</code>
	<code>[:SENSe] :WAVeform :DIF :FILTer :TYPE ?</code>

3 5G NR Mode
3.11 IQ Waveform Measurement

	<p>With DIF40 and/or WBDIF: <code>[:SENSe]:WAVeform:DIF:FILTer:TYPE GAUSSian FLATtop SNYQuist RSNYquist RCOSine RRCosine</code> <code>[:SENSe]:WAVeform:DIF:FILTer:TYPE?</code></p>
Example	<p><code>:WAV:DIF:FILT:TYPE GAUS</code> <code>:WAV:DIF:FILT:TYPE?</code></p>
Dependencies	<p>Gaussian and Flattop are available in all DIF configurations. For the other filter types, the filters are only available when Option DP2, B40, or wider IF Bandwidth option is installed</p> <p>When you select a filter type other than Gaussian or Flattop when using Option B40, B85, B1A, or B1X WBDIF, but then you either explicitly select an IF Path Selection of 10 MHz or 25 MHz B10M/B25M or set a Digital IF BW equal to or narrower than 25 MHz with IF Path Selection Auto ON, the filter type will automatically select the default filter type which is Flattop. If you then again set the IF Path Selection to 85 MHz B85, 125 MHz B125M, or 140 MHz B140M, the filter type will remain as Flattop</p>
Couplings	See the description above
Preset	<p>BASIC with DP2, B40, or wider IF Bandwidth option: FLATtop</p> <p>5G NR, WLAN, Channel Quality: FLATtop</p> <p>All other apps: GAUSSian</p>
State Saved	Saved in instrument state
Range	<p>GAUSSian FLATtop</p> <p>When Option DP2, B40, or wider IF Bandwidth option is installed, the range is as follows. GAUSSian FLATtop SNYQuist RSNYquist RCOSine RRCosine</p>
Backwards Compatibility SCPI	<p><code>[:SENSe]:WAVeform:BANDwidth:SHAPE</code> <code>[:SENSe]:WAVeform:BWIDth:SHAPE</code> <code>[:SENSe]:WAVeform:BANDwidth BWIDth[:RESolution]:TYPE</code></p>

Gaussian

When Option DP2, B40, or wider IF Bandwidth option is installed, the capability for arbitrary Digital IF bandwidths is available. However, for instruments without DP2, B40, or wider IF Bandwidth option, the selectable Gaussian filter bandwidths are predetermined. There are 160 Info BWs (RBWs) arranged in a 24-per-decade sequence from 1 Hz through 3 MHz, plus 4, 5, 6 and 8 MHz settings.

Flattop

When Option DP2, B40, or wider IF Bandwidth option is installed, the capability for arbitrary Digital IF bandwidths is available. However, for instruments without Option DP2, B40 or wider IF Bandwidth option, the selectable Flattop filter bandwidths are predefined. There are 134 Digital IF BWs (RBWs) arranged in a 6-per-decade sequence from 3 Hz through 3 MHz, plus 4, 5, 6 and 8 MHz settings.

Filter BW

This feature is only available when Option DP2, B40, or wider IF Bandwidth option is installed.

Remote Command	<pre>[:SENSe]:WAVeform:DIF:FILTer:BANDwidth <freq> [:SENSe]:WAVeform:DIF:FILTer:BANDwidth? [:SENSe]:WAVeform:DIF:FILTer:BANDwidth:AUTO ON OFF 1 0 [:SENSe]:WAVeform:DIF:FILTer:BANDwidth:AUTO?</pre>
Example	<pre>:WAV:DIF:FILT:BAND 1MHz :WAV:DIF:FILT:BAND? :WAV:DIF:FILT:BAND:AUTO 0 :WAV:DIF:FILT:BAND:AUTO?</pre>
Dependencies	Only available when Option DP2, B40, or wider IF Bandwidth option is installed. Disabled when the Filter Type is FLATtop
Couplings	Sets the same value as the current Digital IF BW value on Preset, or when Channel Filter Bandwidth Auto is ON
Preset	Same value as Digital IF BW ON
State Saved	Saved in instrument state
Range	Auto Man
Min	10 Hz
Max	Clipped to the current Digital IF BW value

Filter Alpha

Sets the filter alpha for the DIF filter. This feature is only available when Option DP2, B40, or wider IF Bandwidth option is installed.

Remote Command	<pre>[:SENSe]:WAVeform:DIF:FILTer:ALPHA <real> [:SENSe]:WAVeform:DIF:FILTer:ALPHA?</pre>
Example	<pre>:WAV:DIF:FILT:ALPH 0.5 :WAV:DIF:FILT:ALPH?</pre>
Dependencies	This feature is only available when Option DP2, B40, or wider IF Bandwidth option is installed. Disabled when the Filter Type is FLATtop
Preset	0.2

State Saved	Saved in instrument state
Min	0.01
Max	1.00
Backwards Compatibility SCPI	<code>[:SENSe]:WAVeform:WBIF:FILTer:ALPHa</code>

Channel Filter Bandwidth Bwcc (Remote Command Only)

This is the backwards compatibility command for Channel Filter Bandwidth for the IQ Waveform measurement.

Remote Command	<code>[:SENSe]:WAVeform:WBIF:FILTer:BA NDwidth <real></code> <code>[:SENSe]:WAVeform:WBIF:FILTer:BA NDwidth?</code>
Example	<code>:WAV:WBIF:FILT:BA ND 0.3</code> <code>:WAV:WBIF:FILT:BA ND?</code>
Dependencies	This feature is only available when Option DP2, B40, or wider IF Bandwidth option is installed
Couplings	The value is determined by the following equation $\text{ChannelFilterBwBwcc} = (\text{ChannelFilterBw} / (\text{DigitalIFBw} * \text{OverSampleRatio}))$
Preset	0.8
State Saved	Saved in instrument state
Min	0.01
Max	1.0

3.11.5 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.11.5.1 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

You can select the measurement view you want to use from the Mode/Measurement/View selector screen.

View Selection by name

You can program the View you want by name:

Remote Command	<code>:DISPlay:WAVeform:VIEW[:SElect] RFENvelope IQ</code> <code>:DISPlay:WAVeform:VIEW[:SElect]?</code>
Example	<code>:DISP:WAV:VIEW RFEN</code> <code>:DISP:WAV:VIEW?</code>
Preset	<code>RFENvelope</code>
State Saved	Saved in instrument state
Range	RF Envelope I/Q Waveform

View Selection by number

You can program the View you want by number:

Remote Command	<code>:DISPlay:WAVeform:VIEW:NSElect <integer></code> <code>:DISPlay:WAVeform:VIEW:NSElect?</code>
Example	<code>:DISP:WAV:VIEW:NSEL 1</code> <code>:DISP:WAV:VIEW:NSEL?</code>
Notes	View 1 is the RF Envelope View View 2 is the I/Q Waveform View
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

RF Envelope

Windows: ["RF Envelope" on page 2407](#), ["Metrics" on page 2408](#)

The RF Envelope View shows an RF envelope (magnitude) window and a metrics table showing the measured values for the mean power and peak-to-mean power.

3 5G NR Mode

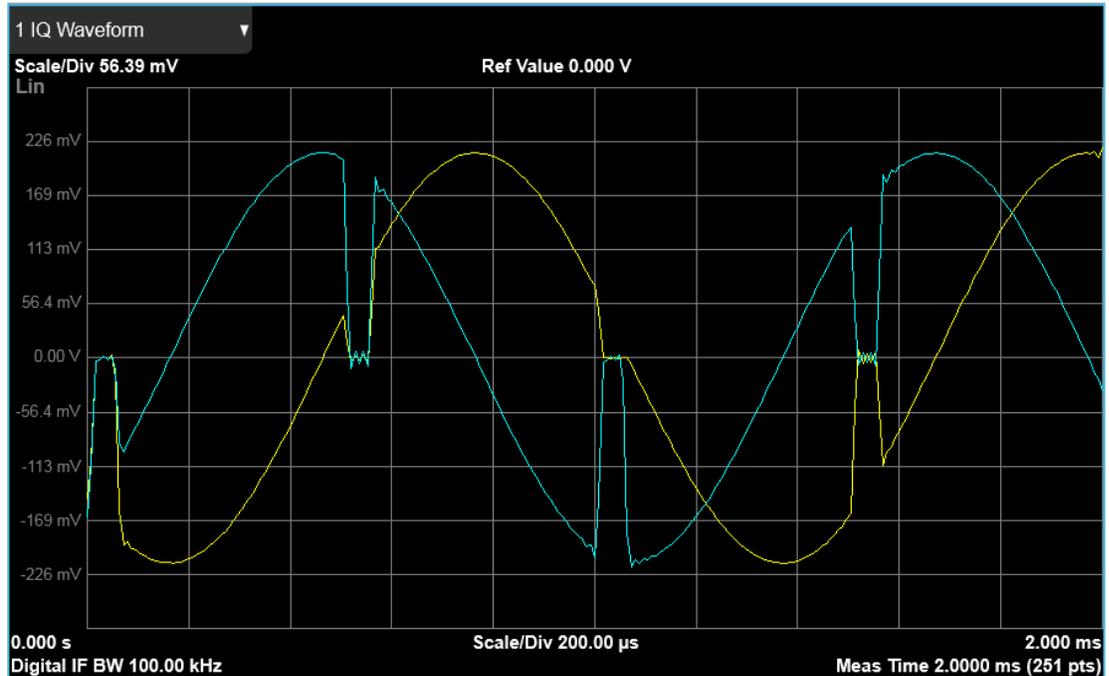

3.11 IQ Waveform Measurement

I/Q Waveform

Windows: "[I/Q Waveform](#)" on page 2409

The I/Q Waveform View shows a window with I and Q voltages vs time. SCPI commands can also be used to query the I/Q pairs while in this View.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:SELEct <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SELEct?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOOM</code>) with</p> <pre><code>:DISP:VIEW:ADV:SEL</code></pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code> <code>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</code></pre>

If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”

If the display is disabled (via **:DISP:ENAB OFF**) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI The legacy node **:DISPlay:VIEW[:SElect]** is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command **:DISPlay:VIEW:ADVanced:NAME <alphanumeric>**

Example **:DISP:VIEW:ADV:NAME “Baseband”**

Creates a new View named **Baseband** from the current View, and selects it as the current View

Notes **<alphanumeric>** is case insensitive; you can specify mixed case, however the name will be evaluated on a single case

If **<alphanumeric>** name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated

If the display is disabled (via **:DISP:ENAB OFF**) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete:ALL</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code> No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: <code>"Baseband,myView1,yourView1"</code> If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2616), then query the list of available Views, the result is undefined

3.11.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
----------------	--

Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are using either the `:SYSTEM:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPLAY:VIEW:ADVANCED:SELECT</code>
Rename User View	<code>:DISPLAY:VIEW:ADVANCED:RENAME</code>
Delete User View	<code>:DISPLAY:VIEW:ADVANCED:DELETE</code>
Create User View	<code>:DISPLAY:VIEW:ADVANCED:NAME</code>
Select Screen	<code>:INSTRUMENT:SCREEN:SELECT</code>
Delete Screen	<code>:INSTRUMENT:SCREEN:DELETE</code>

Name	Command
Delete All But This Screen	:INSTRUMENT:SCREEN:DELETE:ALL
Add Screen	:INSTRUMENT:SCREEN:CREATE
Rename Screen	:INSTRUMENT:SCREEN:RENAME
Sequencer On/Off	:SYSTEM:SEQUENCER

Remote Command	:DISPLAY:ENABLE OFF ON 0 1
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTEM:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPLAY:ENABLE as it did in legacy analyzers

3.11.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.11.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Carrier Reference Frequency

Sets the carrier reference frequency. The center frequencies of carriers are defined as offset frequency from this value. This reference frequency is also the reference of carrier configuration preset.

Since LTE-A, MSR and 5G NR measurements often deal with multiple carriers with distinct bandwidths, the simple Center Frequency parameter used in most measurements does not apply here. Instead, the Carrier Reference Frequency is the key parameter. This must be distinct from the Center Frequency parameter used in other measurements, as Center Frequency can be a global parameter, and it would not make sense for Carrier Reference Frequency to take on this global value.

In LTE-A and 5G NR, if the following conditions are satisfied at the same time:

- the Number of Component Carrier equals 1
- the Center Freq Offset equals to 0 Hz
- the mode of the Center Freq is Auto

then the Center Freq is equivalent to Carrier Ref Freq. When the Center Freq changes in such conditions, the mode of the Center Freq remains as Auto and the Carrier Ref Freq will be changed to same value. The major purpose of this coupling is to keep BWCC with legacy LTE/LTE TDD, in which `:SENSe:FREQuency:CENTer` is used to set up the Frequency of the measurement.

This parameter is available only in the 5GNR, LTEAFDD/TDD, and MSR modes.

See ["More Information" on page 2474](#)

Mode: 5GNR, LTEAFDD, LTEATDD

Remote Command	<code>[:SENSe]:CCARrier:REFerence <freq></code> <code>[:SENSe]:CCARrier:REFerence?</code>
Example	<code>:CCAR:REF 2GHz</code> <code>:CCAR:REF?</code>
Preset	1GHz
State Saved	Saved in instrument state
Min/Max	Depends on instrument minimum/maximum center frequency, as for "Center Frequency" on page 2474

Mode: MSR

Remote Command	<code>[:SENSe]:CARRier:REFerence <freq></code> <code>[:SENSe]:CARRier:REFerence?</code>
Example	<code>:CARR:REF 2GHz</code> <code>:CARR:REF?</code>

Preset	1GHz
State Saved	Saved in instrument state
Min/Max	Depends on instrument minimum/maximum center frequency, as for " Center Frequency " on page 2474

More Information

In most applications, Center Frequency is generally where the carrier center is located at and thus plays a very important role. However, in LTE-Advanced TDD/FDD mode, the measurements are done based on carrier center frequencies and its bandwidths, both of which are calculated or obtained according to the carriers' configuration.

The Center Frequency defined here only for the Monitor Spectrum, IQ Waveform and CCDF measurements, because these three are general type measurements and focus on a certain frequency range, which may be the entire BS RF bandwidth, a frequency range of one of the component carriers or a range far away from the component carriers to see spurious. The Center Frequency in these three measurements has a different meaning, therefore it should be a separate setting from Carrier Reference Frequency.

Carrier center frequencies are defined using offsets from Carrier Reference Frequency which determines absolute frequency locations, which can be set as both absolute and relative frequency from the carrier reference frequency.

Since Center Frequency is only used in those three measurements, Monitor Spectrum, IQ Waveform and CCDF, this control only appears on the Frequency menu of these measurements.

Considering the legacy LTE usability in the converged LTE & LTE-A application, when the mode of the Center Frequency is Auto and the Number of Component Carrier equals to 1 and the Center Frequency Offset equals to 0 Hz, the Center Frequency is equivalent to Carrier Reference Frequency, which is used to set up the Frequency of all the measurements.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a Global tab in its Meas Setup menu.

The Center Freq function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input,

the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus, you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ, and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

For more details, see the following:

- ["RF Center Freq \(Remote Command Only\)" on page 2478](#)
- ["Ext Mix Center Freq \(Remote Command Only\)" on page 2479](#)
- ["I/Q Center Freq \(Remote Command Only\)" on page 2480](#)
- ["Center Frequency Presets" on page 2476](#)
- ["VXT Models with Radio Heads/CIU Frequency Range" on page 2478](#)

Remote Command	<code>[:SENSe] :FREQuency:CENTer <freq></code> <code>[:SENSe] :FREQuency:CENTer?</code>
Example	<code>:FREQ:CENT 50 MHz</code> Sets Center Frequency to 50 MHz <code>:FREQ:CENT UP</code> Increments the Center Frequency by the value of CF Step <code>:FREQ:CENT?</code> Returns the current value of Center Frequency
Notes	This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input <ul style="list-style-type: none"> – For RF input it is equivalent to <code>FREQ:RF:CENT</code> – For I/Q input it is equivalent to <code>FREQ:IQ:CENT</code> – For External Mixer it is equivalent to <code>FREQ:EMIX:CENT</code> Preset and Max values are dependent on Hardware Options (5xx) If no terminator (e.g., MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 2476 , "RF Center Freq (Remote Command Only)" on page 2478 , "Ext Mix Center Freq (Remote Command Only)" on page 2479 , "I/Q Center Freq (Remote Command Only)" on page 2480 and "VXT Models with Radio Heads/CIU Frequency Range" on page 2478
State Saved	Saved in instrument state
Min/Max	Depends on instrument minimum/maximum frequency, mode, measurement, and selected input

	See "Center Frequency Presets" on page 2476, "RF Center Freq (Remote Command Only)" on page 2478, "Ext Mix Center Freq (Remote Command Only)" on page 2479, "I/Q Center Freq (Remote Command Only)" on page 2480 and "VXT Models with Radio Heads/CIU Frequency Range" on page 2478
Status Bits/OPC dependencies	Non-overlapped
Remote Command	<code>[:SENSe] :FREQuency:CENTer:AUTO ON OFF 1 0</code> <code>[:SENSe] :FREQuency:CENTer:AUTO?</code>
Example	<code>:FREQ:CENT:AUTO OFF</code> <code>:FREQ:CENT:AUTO?</code>
Dependencies	This is only available for Monitor Spectrum, Power Stat CCDF and IQ waveform measurements in the MSR, LTE-Advanced FDD/TDD and 5G NR modes
Couplings	When the Center Frequency is changed, the state is automatically changed to Manual Center Frequency, Center Frequency Offset and Carrier Reference Frequency are coupled. When Carrier Reference Frequency changes: Center Frequency : Auto Center Frequency = Carrier Reference Frequency + Center Frequency Offset (fixed) Center Frequency : Man Center Frequency (fixed) = Carrier Reference Frequency + Center Frequency Offset
Preset	ON
State Saved	Saved in instrument state
Range	Auto Man

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (SP900B/21A ,M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (SP900B/21A ,M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (SP900B/11A)F06 (SP900B)	1.0 GHz	6.08 GHz	6.08 GHz
F08 (SP900B)	1 GHz	1.08 GHz	6.6 GHz
F12 (SP900B)	1 GHz	1.08 GHz	8.6 GHz
			12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

SP900SCenter Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

3 5G NR Mode
3.11 IQ Waveform Measurement

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
SP900B+ CIU	6 GHz	5.9 GHz	12 GHz
SP900B+ CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq (Remote Command Only)

Specifies the RF Center Frequency. This command sets the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe]:FREQuency:RF:CENTer <freq></code> <code>[:SENSe]:FREQuency:RF:CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all modes, but the parameter is Measurement Global. So, the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning

Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically, instrument maximum frequency - 5 Hz

Ext Mix Center Freq (Remote Command Only)

Specifies the External Mixer Center Frequency. This command sets the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (for example, RF), you will be returned to the settings that existed when you left External Mixing. So, you will be returned to the band you were in, with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore the Span setting from the other input is retained. Thus, the instrument returns to the Span setting from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz

I/Q Center Freq (Remote Command Only)

Specifies the I/Q Center Frequency. This command sets the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe]:FREQuency:IQ:CENTer <freq></code> <code>[:SENSe]:FREQuency:IQ:CENTer?</code>
Example	<code>:FREQ:IQ:CENT: 30 MHz</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

Center Frequency Offset

Sets the **Center Frequency Offset**, which is coupled with Center Frequency, and is only used in the Monitor Spectrum, IQ Waveform, Power Stat CCDF and PAVT measurements. The **Center Frequency**, **Center Frequency Offset** and **Carrier Reference Frequency** are coupled by this equation:

$$\text{Center Frequency} = \text{Carrier Reference Frequency} + \text{Center Frequency Offset}$$

When you change **Center Frequency Offset**, the **Center Frequency** is updated, but **Carrier Reference Frequency** is not.

Remote Command	<code>[:SENSe]:FREQuency:CENTer:OFFSet <freq></code> <code>[:SENSe]:FREQuency:CENTer:OFFSet?</code>
Example	<code>:FREQ:CENT:OFFS 100kHz</code> <code>:FREQ:CENT:OFFS?</code>
Dependencies	Only available in the MSR, LTE-A FDD/TDD and 5G NR modes
Preset	0 GHz
State Saved	Saved in instrument state
Min	-500 GHz
Max	500 GHz

Adjust Center Frequency to Carrier Config

This immediate action control adjusts **Center Frequency** to cover all the configured carriers when "**Digital IF BW**" on page 2457 is Auto.

Remote Command	<code>[:SENSe] :WAVeform:FREQuency:CENTer:ADJust</code>
Example	<code>:WAV:FREQ:CENT:ADJ</code>
Couplings	When " Digital IF BW " on page 2457 is Man, pressing this control automatically changes it to Auto

3.11.7 Marker

Displays a menu that enables you to select, set up and control the markers for the current measurement.

If there are no active markers, **Marker** selects **Marker 1**, sets it to **POSiTion** (Normal) mode, and places it at the center of the display. If the selected marker is **OFF**, it is set to **POSiTion** mode and placed at the center of the screen, on the trace determined by the Marker Trace rules.

For details of the **POSiTion**, **DELTA**, and **OFF** mode options, see "**Marker Mode**" on page 2484.

3.11.7.1 Select Marker

Sets the selected marker. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a **Peak Search**, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

On any menu tab that includes **Select Marker**, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for POSiTion and Delta markers

3.11.7.2 Settings

The controls on the **Settings** tab include the Marker active function and a radio button selection of the marker control mode (**POSition**, **DELTA**, or **OFF**) for the selected marker, as well as additional functions that help you use markers.

Marker Time

The **Marker Time** control is the fundamental control that you use to move a marker around on the trace. Because it is the default active function in the **Marker** menu, all you need to do is press **Marker** and turn the knob to move the marker left and right on the display. This is always the first control on any **Marker** menu page that follows the Selected Marker.

The SCPI command sets the marker X-Axis value in the current marker X-Axis Scale unit. The marker that is addressed becomes the selected marker. It has no effect (other than to cause the marker to become selected) if the control mode is **OFF**, but it is the SCPI equivalent of entering an X value if the control mode is **POSition** or **DELTA**.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:X <time></code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:WAV:MARK1:X 1</code> <code>:CALC:WAV:MARK1:X?</code>
Notes	If no suffix is sent it will use the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an invalid suffix message will be generated The query returns the marker's absolute X-Axis value if the control mode is POSition . It returns the offset from the marker's reference marker if the control mode is DELTA . The query is returned in the fundamental units for the current marker X-Axis scale: seconds for Time . If the marker is OFF the response is Not A Number
Dependencies	Grayed out and displays three dashes for the value when the selected Marker is OFF
Preset	LTE, LTE-A, 5G NR: 5ms All other Modes: 1.0 ms
Min/Max	- infinity/+ infinity Unlike legacy instruments, where the markers were forced to be on screen, X-Series marker values are not limited and do not clip
Backwards Compatibility SCPI	<code>:CALCulate:MARKer[1] 2 ... 4:X:CENTer</code> This alias is provided for compatibility with the Band Power function in PSA and ESA

Marker X Axis Position (Remote Command Only)

Sets the marker X position in trace points. It has no effect if the control mode is **OFF**, but is the SCPI equivalent of entering a value if the control mode is Normal or Delta. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:X:POSition <real></code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:X:POSition?</code>
Example	<code>:CALC:WAV:MARK:X:POS 500</code> <code>:CALC:WAV:MARK:X:POS?</code>
Notes	The query returns the marker's absolute X-Axis value in trace points if the control mode is POSition , or the offset from the marker's reference marker in trace points if the control mode is DELTA . The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points
Preset	After a preset, all markers are turned OFF , so Marker X-Axis Value query returns a <i>Not A Number (NAN)</i>
State Saved	No
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command Only)

Queries the marker Y-Axis result value in the current marker Y-Axis unit. The "result" of a marker is the value that is displayed on the second line of the Marker Result block. To properly interpret the returned value, you must also know how the instrument's Y-Axis Unit is set, as described below.

A marker can have up to two results, only one of which is displayed or returned in a query, as follows:

- **Absolute** Result: every marker has an Absolute Result. For **POSition** and **DELTA** markers, the Y-axis value of the trace point the marker is currently on. The Absolute Result is displayed in the result block or returned as a query, unless the marker control mode is **DELTA**
- **Relative** Result: if a marker's control mode is **DELTA**, the *relative* result is displayed in the result block or returned in a query. This is the ratio of the Absolute Result of a delta marker to the Absolute Result of its reference marker. The ratio is expressed in dB

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:Y?</code>
Example	<code>:CALC:WAV:MARK11:Y?</code>
Notes	When the marker is on, IQ waveform returns I and Q values

3 5G NR Mode
3.11 IQ Waveform Measurement

Case #1 - Trace RF, I or Q: returns a single double value

```
>:CALC:WAV:MARK1:Y?
-2.402406506109E+001
```

Case #2 - Trace IQ: returns a double array of two values, the first is I, and the second is Q

```
>:CALC:WAV:MARK1:Y?
-3.006944493834E-003,+9.9870666467354E-004
```

The IQ selection is for backwards compatibility purposes. For new designs, use the I and/or Q selection instead

You must be in a Mode that includes the Waveform measurement to use this command. Use `:INSTRument:SElect` to set the mode

Preset	Result dependent on the marker setup and signal source
State Saved	No
Backwards Compatibility SCPI	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:FUNCTion:RESult?</code>

Marker Mode

Sets the marker control mode to **POSition**, **DELTA**, or **OFF**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **OFF**, pressing **Marker** sets it to **POSition** (Normal) and places it at the center of the screen on the trace determined by the Marker Trace rules. At the same time, Marker X-Axis Value appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **OFF**, there is no active function and the active function is turned off.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:MODE POSition DELTA OFF</code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:MODE?</code>
Example	<code>:CALC:WAV:MARK:MODE OFF</code> <code>:CALC:WAV:MARK:MODE?</code>
Preset	OFF
State Saved	Saved in instrument state
Range	POSition DELTA OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is **OFF** to state **ON** or 1 puts it in **POSiTion** mode and places it at the center of the screen.

Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:STATe OFF ON 0 1</code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:STATe?</code>

Delta Marker (Reset Delta)

Pressing this control has exactly the same effect as pressing the **DELTA** selection on the "Marker Mode" on page 2484 radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Enables you to configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	<code>:CALCulate:WAVeform:MARKer:AOFF</code>
Example	<code>:CALC:WAV:MARK:AOFF</code>

Couple Markers

When this function is **ON**, moving any marker causes an equal X-Axis movement of every other marker that is not **OFF**. By "equal X-Axis movement" we mean that we preserve the difference between each marker's X-Axis value (in the fundamental x-axis units of the trace that marker is on) and the X-Axis value of the marker being moved (in the same fundamental x-axis units).

This may result in markers going off screen.

Remote Command	<code>:CALCulate:WAVeform:MARKer:COUPlE[:STATe] ON OFF 1 0</code> <code>:CALCulate:WAVeform:MARKer:COUPlE[:STATe]?</code>
----------------	--

Example	<code>:CALC:WAV:MARK:COUP ON</code> <code>:CALC:WAV:MARK:COUP?</code>
Preset	OFF Presets on Mode Preset and "All Markers Off" on page 2485
State Saved	Saved in instrument state

3.11.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.
 Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Time

The **Marker Time** control is the fundamental control that you use to move a marker around on the trace. This is the same as ["Marker Time" on page 2482](#) on the **Settings** tab.

Peak Search

Pressing this control moves the selected marker to the trace point that has the maximum Y-Axis value for that marker's trace.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:MAXimum</code>
Example	<code>:CALC:WAV:MARK2:MAX</code> <code>:SYST:ERR?</code> can be used to query the errors to determine if a peak is found. The message "No peak found" (-200) will be returned after an unsuccessful search
Notes	Sending this command selects the subopcoded marker In W-CDMA Mode, this command does <i>not</i> work when the selected marker is located on the Polar trace. In this case, the command is ignored

Next Peak

Pressing this control moves the selected marker to the peak that is next lower in amplitude than the current marker value.

If the selected marker was **OFF**, then it is turned **ON** as a **POSition** marker, and a Peak Search is performed.

Remote Command	:CALCulate:WAVeform:MARKer[1] 2 ... 12:MAXimum:NEXT
Example	:CALC:WAV:MARK:MAX:NEXT
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum Y-Axis value on the current trace.

If the selected marker is **OFF**, it is turned **ON** before the minimum search is performed.

Remote Command	:CALCulate:WAVeform:MARKer[1] 2 ... 12:MINimum
Example	:CALC:WAV:MARK:MIN
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Marker Delta

Pressing this control is exactly the same as pressing the **Delta** selection on the **"Marker Mode" on page 2484** radio button on the **Settings** tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here in the **Peak Search** menu to allow you to conveniently perform a Peak Search and change the marker's control mode to Delta, without having to access two separate menus.

3.11.7.4 Marker Function

The controls in this tab perform post-processing operations on marker data.

The **Marker Function** menu controls which marker functions are turned on, and allows you to adjust the setup parameters for each function. These parameters include the following, but only one parameter can be assigned to a given marker:

- Marker Noise
- Interval Power
- Interval Density
- Off

More Information

The post-processing operations on markers, in the Waveform measurement, are based on the measurement specifications. Marker Functions are distinct from measurement functions, which automatically perform complex sequences of setup, data acquisition, and display operations in order to measure specified signal characteristics. Marker Functions are specified for each individual marker, and may be turned on individually for each marker.

Marker Time

The **Marker Time** control is the fundamental control that you use to move a marker around on the trace. This is the same as ["Marker Time" on page 2482](#) on the **Settings** tab.

Interval Function

Sets the marker control function type to one of:

Option	Parameter
Marker Noise	NOISe
Interval Power	BPOWer
Interval Density	BDENsity
Marker Function Off	OFF

All interactions and dependencies detailed under the control description are enforced when the remote command is sent.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:FUNCTION NOISe BPOWer BDENsity OFF</code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:FUNCTION?</code>
Example	<code>:CALC:WAV:MARK:FUNC BPOW</code> <code>:CALC:WAV:MARK:FUNC?</code>

Preset	OFF
State Saved	Saved in instrument state
Range	Marker Noise Interval Power Interval Density Off
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Interval Span

Sets the width of the Span for the selected marker.

Remote Command	:CALCulate:WAVeform:MARKer[1] 2 ... 12:FUNCtion:BAND:SPAN <time>
Example	:CALC:WAV:MARK:FUNC:BAND:SPAN 20 ms :CALC:WAV:MARK:FUNC:BAND:SPAN?
Couplings	Changing the Interval Span necessarily changes the "Interval Left" on page 2489 and "Interval Right" on page 2489 values
Preset	10% of Meas Time
State Saved	Saved in instrument state
Min	0
Max	100 s

Interval Left

Sets the left edge time for the band of the selected marker.

Remote Command	:CALCulate:WAVeform:MARKer[1] 2 ... 12:FUNCtion:BAND:LEFT <time>
Example	:CALC:WAV:MARK12:FUNC:BAND:LEFT 1 s :CALC:WAV:MARK12:FUNC:BAND:LEFT?
Couplings	Changing the Interval Left necessarily changes the "Interval Span" on page 2489 and "Interval Right" on page 2489 values
Preset	5% of Meas Time
State Saved	Yes
Min	0
Max	100 s

Interval Right

Sets the right edge time for the band of the selected marker.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:FUNction:BAND:RIGHT <time></code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:FUNction:BAND:RIGHT?</code>
Example	<code>:CALC:WAV:MARK12:FUNC:BAND:RIGH 1 s</code> <code>:CALC:WAV:MARK12:FUNC:BAND:RIGH?</code>
Notes	You must be in the IQ Waveform measurement to use this command
Couplings	Changing the Interval Right necessarily changes the "Interval Left" on page 2489 and "Interval Span" on page 2489 values
Preset	5% of Meas Time
State Saved	Yes
Min	0
Max	100 s

3.11.7.5 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Time

This is the fundamental control that you use to move a marker around on the trace. This is the same as **"Marker Time"** on page 2482 on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the *"reference marker"* for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a Delta Marker to make this attribute relevant. If it is a Delta Marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:REFerence <integer></code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:REFerence?</code>
Example	<code>:CALC:WAV:MARK:REF 8</code> <code>:CALC:WAV:MARK:REF?</code>
Notes	This command causes the marker specified with the subopcode to become selected A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried, a single value is returned (the specified marker number's relative marker)

Couplings	The act of specifying the selected marker's reference marker makes the selected marker a Delta marker If the reference marker is OFF , it is turned on in POSiTion mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if Marker 2 is selected, then its default reference marker is Marker 3. The exception is Marker 12, which has a default reference of Marker 1 Set to the defaults by using Restore Mode Defaults . This is not reset by Marker Off , All Markers Off , or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Range	1 to 12 Remote Command only: if the range is exceeded, then the value is clipped
Min	1
Max	12
Annunciation	Appears in the marker label of a Delta marker

Marker Trace

Assigns the specified marker to the designated trace.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:TRACe RFENvelope I Q IQ</code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:TRACe?</code>
Example	<code>:CALC:WAV:MARK:TRAC RFEN</code> <code>:CALC:WAV:MARK:TRAC?</code>
Notes	The IQ selection is for backwards compatibility purposes. For new designs, use the I and/or Q selection instead
Preset	RFEN
State Saved	Yes
Range	RFENvelope I Q IQ

Marker Settings Diagram

Lets you configure the Marker system using a visual utility. This is the same as the **"Marker Settings Diagram" on page 2485** control on the **Settings** tab.

3.11.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.11.8.1 Settings

Contains frequently used Meas Setup functions to which you will want the fastest access.

Avg/Hold Number

Sets the number of sweeps (average counts) that are averaged. After the specified number of sweeps, the ["Average Mode" on page 2492](#) (terminal control) setting determines the averaging action.

This control also lets you turn Averaging on and off.

Remote Command	<code>[:SENSe] :WAVeform:AVERage:COUNT <integer></code> <code>[:SENSe] :WAVeform:AVERage:COUNT?</code> <code>[:SENSe] :WAVeform:AVERage[:STATe] OFF ON 0 1</code> <code>[:SENSe] :WAVeform:AVERage[:STATe] ?</code>
Example	<code>:WAV:AVER:COUN 1001</code> <code>:WAV:AVER:COUN?</code> <code>:WAV:AVER ON</code> <code>:WAV:AVER?</code>
Preset	10 OFF
State Saved	Saved in instrument state Saved in instrument state
Range	OFF ON
Min/Max	1/20001
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N, where n is the current average and N is the average count

Average Mode

Sets the Average Mode:

- **EXponential**: The measurement averaging continues using the specified number of averages to compute each averaged value. The average is displayed at the end of each sweep
- **REpeat**: The measurement resets the average counter each time the specified number of averages is reached

Remote Command	<code>[:SENSe]:WAVeform:AVERage:TCONtrol EXPOnential REPeat</code> <code>[:SENSe]:WAVeform:AVERage:TCONtrol?</code>
Example	<code>:WAV:AVER:TCON REP</code> <code>:WAV:AVER:TCON?</code>
Preset	<code>EXPOnential</code>
State Saved	Saved in instrument state
Range	<code>EXPOnential REPeat</code>

Average Type

Sets the type of averaging. When **AUTO** is selected, the instrument chooses the type of averaging. Available Average Types are:

Option	Parameter
Log-Pwr Avg	<code>LOG</code>
Power (RMS)	<code>RMS</code>
Voltage	<code>SCALar</code>

When one of the average types is selected manually, the instrument uses that type regardless of other instrument settings, and shows **Man** on the **Average Type** control.

Remote Command	<code>[:SENSe]:WAVeform:AVERage:TYPE LOG MAXimum MINimum RMS SCALar</code> <code>[:SENSe]:WAVeform:AVERage:TYPE?</code> For EXT-C, E6630A, E6640A, M90XA, use the following command. <code>[:SENSe]:WAVeform:AVERage:TYPE LOG RMS SCALar</code> <code>[:SENSe]:WAVeform:AVERage:TYPE:AUTO ON OFF 1 0</code> <code>[:SENSe]:WAVeform:AVERage:TYPE:AUTO?</code>
Example	<code>:WAV:AVER:TYPE RMS</code> <code>:WAV:AVER:TYPE?</code> <code>:WAV:AVER:TYPE:AUTO 0</code> <code>:WAV:AVER:TYPE:AUTO?</code>
Notes	The selections MAX and MIN are retained for backwards compatibility, but they are removed from the front panel access because they are not an Average function
Couplings	AUTO selects Power (RMS) averaging if a Marker Function (Marker Noise, Band/Intvl Power) is on
Preset	<code>RMS</code> <code>ON</code>
State Saved	Saved in instrument state
Range	Log-Pwr Avg Power (RMS) Voltage

Time Avg Num

Sets the number of HW averages to be executed per each data acquisition.

HW Averaging

Changes the number of time averages to be made using hardware. This averaging is much faster than the standard averaging done in software. The hardware averaging is done on the complex voltage time trace data before any measurement application averaging is done. Both types of averaging (HW and SW) can be done on the same measurement data.

When time averaging is being done in HW, each trace update represents N fresh data acquisitions averaged together, where N is the number of time averages. You cannot access the individual time data. Note that this averaging is done prior to the SW averaging done within the application. Thus, if time averaging is turned on, the trace in this measurement shows the result of HW averaging even if the normal (SW) averaging is turned off. Subsequent normal (SW) averaging is orthogonal to this hardware-based time averaging.

Thus, it is possible to turn off normal (SW) averaging within the application but still have the HW averaging set to a certain number greater than 1. In other words, turning averaging off within the measurement will not affect HW averaging. If HW averaging needs to be turned off, simply set the HW Averaging parameter to 1.

The Auto/Man feature of Time Avg Num works differently than other parameters. Since it is time averaging, a trigger source something other than Free Run should be used to synchronize successive data acquisitions to avoid cancelling out the signal to be measured. It is most useful for a periodic signal with known periods used in conjunction with the Periodic trigger. Thus, when in Auto, the Trigger Source automatically changes to Periodic trigger when Time Avg Num is turned ON. The trigger period will be set to the current Meas Time value. Any changes to Meas Time will change the Periodic trigger period to the same value and vice versa. If a trigger source other than Periodic trigger is manually selected, the Time Avg Num Auto/Man toggle is set to Man.

Remote Command	<pre>[:SENSe]:WAVeform:AVERage:TACount <integer> [:SENSe]:WAVeform:AVERage:TACount? [:SENSe]:WAVeform:AVERage:TACount:AUTO OFF ON 0 1 [:SENSe]:WAVeform:AVERage:TACount:AUTO?</pre>
Example	<pre>:WAV:AVER:TAC 10 :WAV:AVER:TAC? :WAV:AVER:TAC:AUTO ON :WAV:AVER:TAC:AUTO?</pre>

Notes	This feature is only available when Option DP2, B40, or wider IF Bandwidth option is installed
Preset	1 ON
State Saved	Saved in instrument state
Range	Auto Man
Min/Max	1/65535

Meas Time

Enables you to set how long the measurement is performed. X Scale only changes the scale of the display.

Remote Command	<code>[:SENSe]:WAVeform:SWEEp:TIME <time></code> <code>[:SENSe]:WAVeform:SWEEp:TIME?</code>
Example	<code>:WAV:SWE:TIME 50 ms</code> <code>:WAV:SWE:TIME?</code>
Notes	Specifies and returns how long the measurement is performed. It is the time record length of the measurement waveform. The Max time may be reduced when the sample frequency is high due to the memory limitation
Preset	LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR: 10 ms All other Modes: 2.000000 ms
State Saved	Saved in instrument state
Range	1.000 us to 100.00 s
Min/Max	1.000 us/100.0 s 1.000 us/3200 s

Sample Rate

Sets an arbitrary sample rate for the acquired data to be processed.

Remote Command	<code>[:SENSe]:WAVeform:SRATE <freq></code> <code>[:SENSe]:WAVeform:SRATE?</code>
Example	<code>:WAV:SRAT 1.3636 MHz</code>
Notes	The command and query are available when Option DP2, B40, or wider IF Bandwidth option is installed. For other configuration, only the query is available
Preset	BASIC: 125.0 kHz BASIC: 100 MHz PNOISE: 125.0 kHz WCDMA: 125.0 kHz

3 5G NR Mode
3.11 IQ Waveform Measurement

	LTEA FDD/TDD, 5G NR: Automatically calculated	
	WLAN: 31.25 MHz	
	EDGE GSM: 637.5 kHz	
	MSR: 125.0 kHz	
Min/Max	12.5 Hz/Option dependent	
	For Option DP2, B40 or wider IF Bandwidth option:	
	Digital IF 10 MHz path	12.5 MHz
	Digital IF 25 MHz path	31.25 MHz
	Digital IF 40 MHz path	50 MHz
	Option B85 85 MHz path	106.25 MHz
	Option B1A 125 MHz path	156.25 MHz
	Option B1X 140 MHz path	175 MHz
	Option B1Y 160 MHz path	200 MHz
	Option B2X 255 MHz path	300 MHz
	Option B5X 510 MHz path	300 MHz
	For all other configurations:	
	10 MHz path	15 MHz
	Option B25 25 MHz path	45 MHz

Meas Setup Summary Table

Enables you to view and access many of the parameters in the **Meas Setup** menus on one screen.

Spur Avoidance

Because the VXT models SP900B/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates when the Digital IF BW \leq maxBW/2.5. See "[More Information](#)" on page 2497.

You can disable this function to speed up your measurement, by setting **Spur Avoidance** to "Disabled".

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because the Digital IF BW > maxBW/2.5, the following warning message will appear in the status bar: “Settings Alert; Spur Avoidance Off”. This is to alert you that measurement accuracy might be impacted by the fact that **Spur Avoidance** is not in effect.

Remote Command	<code>[:SENSe]:WAVeform:SAVoid[:STATe] ON OFF 0 1</code> <code>[:SENSe]:WAVeform:SAVoid[:STATe]?</code>
Example	<code>:WAV:SAVoid ON</code> <code>:WAV:SAVoid?</code>
Dependencies	This control only appears in VXT models SP900B/11A/15A
Preset	<code>OFF</code>
State Saved	Saved in instrument state
Range	<code>ON OFF</code>

More Information

The Maximum Digital IF BW depends on the installed options, and selected Center Frequency.

VXT models SP900B/11A

Option limitation:

Option	Max Digital IF BW
B40	40 MHz
B3X	300 MHz
B6X	600 MHz
B12	1200 MHz

Center frequency limitation:

Center Frequency	Max Digital IF BW
330 MHz ~ 380 MHz	$(CF - 330 \text{ MHz}) * 2$
380 MHz ~ 550 MHz	100 MHz
550 MHz ~ 1310 MHz	200 MHz
1310 MHz ~ 2000 MHz (without Option EP6)	600 MHz
2000 MHz ~ 5480 MHz (without Option EP6)	1200 MHz
5480 MHz ~ 6080 MHz (without Option EP6)	$(6080 \text{ MHz} - CF) * 2$
1310 MHz ~ 1900 MHz (Option EP6)	600 MHz
1900 MHz ~ 6000 MHz (Option EP6)	1200 MHz
6000 MHz ~ 6600 MHz (Option EP6)	$(6600 \text{ MHz} - CF) * 2$

VXT model SP900B

Option limitation:

Option	Max Digital IF BW
B4X	400 MHz
B8X	800 MHz
B12	1200 MHz

Center frequency limitation:

Center Frequency	Max Digital IF BW
330 MHz ~ 380 MHz	(CF - 330 MHz) * 2
380 MHz ~ 550 MHz	100 MHz
550 MHz ~ 1310 MHz	200 MHz
1310 MHz ~ 2000 MHz	600 MHz
2000 MHz ~ 12300 MHz	1200 MHz
12300 MHz ~ 12900 MHz	(12900 MHz - CF) * 2

Auto Couple

Immediately puts all Auto/Man functions into Auto. The **Auto Couple** action is confined to the current measurement only. It does not affect other measurements in the Mode.

In the Auto state, Auto/Man functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the Auto/Man controls for the current measurement are set to Auto, and all measurement settings coupled to the Auto/Man parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see ["Measurement-Specific Details" on page 2499](#) below.

Remote Command	<code>:COUPle ALL</code>
Example	<code>:COUP ALL</code>
Backwards Compatibility SCPI	<code>:COUPLE ALL NONE</code>
Backwards Compatibility Notes	<code>:COUP:NONE</code> puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All Auto/Man parameter couplings in the measurement are set to Auto. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no Auto/Man coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in Auto.

Any Auto/Man selection specific (local) to the other measurements in the current Mode will not be affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as "AutoRange" or "AutoScale", will not be affected.

Executing the **Auto Couple** command generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to Auto, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that are dependent on one or more other parameters. The coupling and dependency rules for each parameter are defined in the chapter describing that parameter.

Executing the **Auto Couple** command *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI

Parameters affected by Auto Couple are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time
- Center Frequency Step
- Resolution Bandwidth

3 5G NR Mode
3.11 IQ Waveform Measurement

- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics

For Harmonics, these parameters are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	<code>:CONFigure:WAVeForm</code>
----------------	----------------------------------

Example	<code>:CONF:WAV</code>
---------	------------------------

Notes	Restore default values of all parameters
-------	--

3.11.8.2 Radio

The Radio tab contains controls to select link direction.

Direction

Direction specifies whether the 5G NR signal is an uplink signal or a downlink signal.

This control allows you to set the Direction of the signal being measured.

Remote Command	<code>[:SENSe]:RADio:STANdard:DIRection DLINK ULINK</code>
----------------	---

	<code>[:SENSe]:RADio:STANdard:DIRectioN?</code>
Example	<code>:RAD:STAN:DIR DLIN</code>
Dependencies	When N9085EM0E is not installed and N9085EM4E is installed, only Uplink is available
Couplings	<p>Changing the direction affects the gate source as follows</p> <ul style="list-style-type: none"> - If changed to uplink: RF burst - If changed to downlink: External 1 <p>In Transmit On Off Power, changing the direction affects the trigger source as follows</p> <ul style="list-style-type: none"> - If changed to uplink: Periodic - If changed to downlink: External 1 except for models with the H1G option. With the H1G option, the trigger source changes as follows. <ul style="list-style-type: none"> - External 1, when Info BW \leq 255 MHz - External 3, when Info BW \geq 256 MHz <p>Changing the direction affects many other modulation analysis setup parameters</p>
Preset	ULINK when N9085EM0E is not installed and N9085EM4E is installed Otherwise, DLINK
State Saved	Yes
Range	Uplink only when N9085EM0E is not installed and N9085EM4E is installed Otherwise, Downlink Uplink

3.11.8.3 Component Carriers

Contains settings that let you configure the analyzer to match the component carriers in your 5G NR signal.

Number of Component Carriers

Specifies how many component carriers are included in the 5G NR measurements. The 5G NR supports the maximum of 16 component carriers.

Remote Command	<code>[:SENSe]:CCARrier:COUNT <integer></code> <code>[:SENSe]:CCARrier:COUNT?</code>
Example	<code>:CCAR:COUN 1</code> <code>:CCAR:COUN?</code>
Preset	1
State Saved	Yes
Min	1
Max	16

Carrier Allocation

Specifies the carrier frequency allocation. There are two types of allocation, contiguous and non-contiguous. Non-Contiguous frequency allocation is defined as an allocation where two sub-blocks are separated with a sub-block gap:

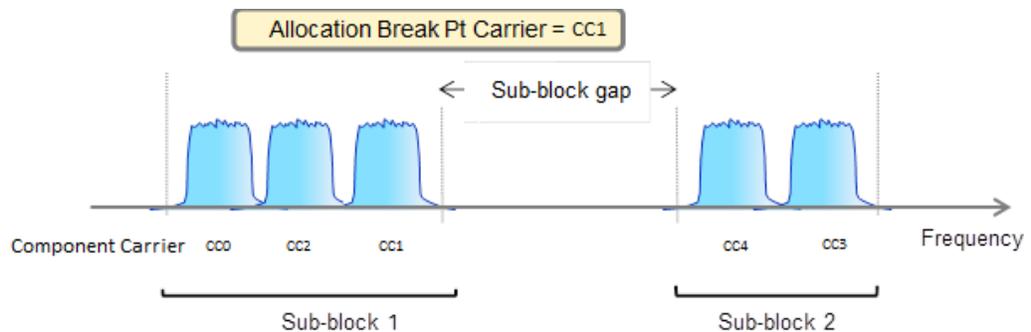

- Contiguous – All the component carriers belong to one block and no sub-block gap exists
- Non-Contiguous – Component carriers are separated into two sub-blocks. Allocation Break Pt Carrier determines how sub-blocks are configured

Remote Command	<code>[[:SENSe]:CCARrier:CONFig:ALLocation CONTiguous NCONtiguous</code> <code>[[:SENSe]:CCARrier:CONFig:ALLocation?</code>
Example	<code>:CCAR:CONF:ALL CONT</code> <code>:CCAR:CONF:ALL?</code>
Preset	<code>CONtiguous</code>
State Saved	Saved in instrument state
Range	Contiguous Non-Contiguous

Non-Contiguous Break at

Specifies an allocation break point in non-contiguous carrier allocation. First sub-block starts from the lowest frequency carrier and stops at the allocation break point carrier. Next sub-block starts from the next upper frequency carrier and ends at the highest frequency carrier.

one example is shown below. In the example carrier indices are not in the order of carrier frequency. In the example, Allocation Break Pt Carrier is CC1. It means that sub-block 1 ends at carrier CC1 and sub-block 2 starts at carrier CC4. Sub-block gap is located between carrier CC1 and CC4.

Remote Command	<code>[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint CC0 ... CC15</code> <code>[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint?</code>
Example	<code>:CCAR:CONF:ALL:NCON:ABP CC0</code> <code>:CCAR:CONF:ALL:NCON:ABP?</code>
Dependencies	Allocation Break Point is coupled to Number of Component Carriers. For example, Allocation Break Point list will include CC0~CC1 if the number of Component Carriers is 2
Preset	<code>CC0</code>
State Saved	Saved in instrument state
Range	<code>CC0 ... CC15</code>

Configure Comp Carriers

This dialog lets you perform a detailed configuration of your component carriers, including number of carriers, bandwidth, offset, integration bandwidth, and so on.

Configure CCs

Lets you configure bandwidth, frequency offsets, and integration bandwidth, and also lets you exclude certain carriers from the measurement.

More Information

"Measure Carrier" on page 2636	"Sidelink" on page 2637	"Bandwidth" on page 2637	"Freq Range" on page 2638

"CHP Power Integration Bandwidth" on page 2640	"ACP Power Integration Bandwidth" on page 2640	"SEM Power Integration Bandwidth" on page 2642	"N_Grid_Size (Display Only)" on page 1491
"SCS (Power Meas)" on page 2642			

Number of Component Carriers

This is the same as the control on the menu panel. See ["Number of Component Carriers" on page 2633](#).

Auto Frequency Offset

Changing this value will automatically calculate frequency offset based on a specified set of rules (For the rules, see 5.4.1.1 and 5.4.1.2 in 3GPP TS 38.104 V15.4.0).

Remote Command	[:SENSe]:CCARrier:AFOffset OFF ACRA100K ACRA15K ACRA60K CARA100K CARA15K CARA60K [:SENSe]:CCARrier:AFOffset?	
Example	:CCAR:AFOF ACRA100K :CCAR:AFOF?	
Notes	When you change the value to OFF , nothing happens	
Dependencies	<p>Changing Number of Component Carriers, CC's Bandwidth, or CC's Frequency Range will recalculate frequency offset unless OFF is selected</p> <p>When CC's Frequency Offset is manually changed, this parameter is set to OFF</p> <p>This feature isn't supported when Carrier Allocation is set to Non-Contiguous. When Auto Freq Offset is set to a value other than OFF with Number of Component Carriers = 1, then, CCO Freq Offset is automatically adjusted to 0 Hz</p>	
Preset	OFF	
State Saved	Yes	
Range	The cascading list is shown below	
	Channel Spacing for	Channel Raster
	Adjacent NR Carriers	100 kHz
	Carrier Aggregation	15 kHz
	Off	60 kHz
	Channel Spacing for	Channel Raster
	Adjacent NR Carriers	100 kHz
	Carrier Aggregation	15 kHz
	Off	60 kHz
	Channel Spacing for	Channel Raster
	Adjacent NR Carriers	
	Carrier Aggregation	
	Off	

Carrier Allocation

This is the same as the control on the menu panel. See ["Carrier Allocation" on page 2633](#).

Non-Contiguous Break at

This is the same as the control on the menu panel. See ["Non-Contiguous Break at" on page 2634](#).

Measure Carrier

This column sets whether to measure this component carrier or not.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15[:STATe] OFF ON 0 1</code> <code>[:SENSe]:CCARrier[0] 1 ... 15[:STATe]?</code>
Example	<code>:CCAR0 ON</code> <code>:CCAR0?</code>
Notes	The command is used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Couplings	Measure Carrier of the CCs that are within "Number of Component Carriers" is set to ON when the action "Apply Preset (to All CCs)" is executed X
Preset	ON
State Saved	Saved in instrument state

Sidelink

Allows the user to select the mode of component carrier from either normal 5G NR uplink or 5G NR V2X sidelink when Direction is Uplink.

- OFF: The component carrier is 5G NR uplink carrier. The 5G NR uplink parameters per carrier are in scope.
- ON: The component carrier is 5G NR V2X sidelink carrier. The sidelink parameters per carrier are in scope.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:SLINk ON OFF 1 0</code> <code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:SLINk?</code>
Example	<code>CCAR4:RAD:SLIN ON</code> <code>CCAR4:RAD:SLIN?</code>

3 5G NR Mode
3.11 IQ Waveform Measurement

Dependencies	Available when the required license is installed and Direction is Uplink Unavailable when " Bandwidth " on page 2637 is 35 MHz, 45 MHz, 800 MHz, 1600 MHz, and 2000 MHz
Preset	OFF
State Saved	Saved

Bandwidth

This column enables you to set the bandwidth of each component carrier for 5G NR signal (which also determines the total number of resource blocks for Modulation Analysis measurement).

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:STANdard:BANDwidth B5M B10M B15M B20M B25M B30M B35M B40M B45M B50M B60M B70M B80M B90M B100M B200M B400M B800M B1600M B2000M</code> <code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:STANdard:BANDwidth?</code>
Example	<code>:CCAR4:RAD:STAN:BAND B50M</code>
Dependencies	When " Sidelink " on page 2637 is enabled, 35 MHz, 45 MHz, 800 MHz, 1600 MHz, and 2000 MHz are not available. Selecting any of those BWs turns Sidelink off and the column becomes grayed out
Couplings	This value will be preset to the Bandwidth value in the Meas Standard menu when the action "Apply Preset (to All CCs)" is executed
Preset	B100M
State Saved	Yes
Range	5 MHz 10 MHz 15 MHz 20 MHz 25 MHz 30 MHz 35 MHz 40 MHz 45 MHz 50 MHz 60 MHz 70 MHz 80 MHz 90 MHz 100 MHz 200 MHz 400 MHz 800 MHz 1600 MHz 2000 MHz

Freq Range

This column enables you to set which frequency range to which each component carrier belongs.

Frequency Range affects CC Bandwidth, Max RB Numbers, ACP Measurement Noise Bandwidth and SEM Integ BW.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:STANdard:FRANge FR1 FR2</code> <code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:STANdard:FRANge?</code>
Example	<code>:CCAR1:RAD:STAN:FRAN FR1</code>
Dependencies	Available selections differ depending on " Bandwidth " on page 2637 as follows: <ul style="list-style-type: none"> - 50 MHz and 100 MHz: FR1 and FR2 - 200 MHz or wider: FR2 only - Other than above: FR1 only

Couplings	This value will be preset to the Frequency Range value in the Meas Standard menu when the action “Apply Preset (to All CCs)” is executed
Preset	FR1
State Saved	Yes
Range	FR1 FR2

Freq Offset

This column sets the component carrier center frequency as offset from the Carrier Ref Frequency.

Remote Command	<code>[:SENSe]:CCARrier<n>:FREQuency:OFFSet <freq></code> <code>[:SENSe]:CCARrier<n>:FREQuency:OFFSet?</code>
Example	<code>:CCAR4:FREQ:OFFS 10MHz</code> <code>:CCAR4:FREQ:OFFS?</code>
Notes	Used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers Frequency Offset of CC0 to CC15 is recommended to be set in ascending order for the best related couplings. You can see whether sub-blocks are configured as you expect in the trace of Monitor Spectrum by turning on Sub-block Attribute under Display > Meas Display. If sub-blocks are not configured correctly, results related to sub-block gap such as ACP/SEM inner offset results are not measured correctly Also, in some cases, make sure if the “Non-Contiguous Break at” parameter is set to the intended value since it’s often left unchanged after Frequency Offset of CCs are changed
Preset	0 Hz
State Saved	Saved in instrument state
Min	-50 GHz
Max	50 GHz

Cell ID Auto

Enable and disable Cell ID auto detection based on SSB.

NOTE

This setting is available for EVM measurement only.

Remote Command	<code>[:SENSe]:EVM:CCARrier[0] 1 ... 15:CID:MODE AUTO MANua1</code> <code>[:SENSe]:EVM:CCARrier[0] 1 ... 15:CID:MODE?</code>
Example	<code>:EVM:CCAR:CID:MODE MAN</code> <code>:EVM:CCAR:CID:MODE?</code>

Preset	MANual
State Saved	Saved in instrument state

Cell ID Value

Specify Cell ID for the component carrier.

NOTE This setting is available for EVM measurement only.

Remote Command	<code>[:SENSe]:EVM:CCARrier[0] 1 ... 15:CID <integer></code> <code>[:SENSe]:EVM:CCARrier[0] 1 ... 15:CID?</code>
Example	<code>:EVM:CCAR4:CID 0</code> <code>:EVM:CCAR4:CID?</code>
Couplings	Invalid when Cell ID Auto is on
Preset	0
State Saved	Saved in instrument state
Min	0
Max	1007

Demod Spectrum

This column determines if the spectrum of the incoming data is mirrored or not. The actual mirroring is accomplished by conjugating the complex time data.

Note that only the Modulation Analysis measurement and Conformance EVM measurement support this feature.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:SPECTrum NORMal INVert</code> <code>[:SENSe]:CCARrier[0] 1 ... 15:SPECTrum?</code>
Example	<code>:CCAR0:SPEC INV</code> <code>:CCAR0:SPEC?</code>
Preset	NORM
State Saved	Yes
Range	Normal Invert

CHP Power Integration Bandwidth

This column specifies the range of integration used in calculating the power in the component carrier s in the CHP measurement.

NOTE This setting is *not* available for EVM.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:CHPower:BANDwidth:INTEgration <freq></code> <code>[:SENSe]:CCARrier[0] 1 ... 15:CHPower:BANDwidth:INTEgration?</code>
Example	<code>:CCAR0:CHP:BAND:INT 20MHz</code> <code>:CCAR0:CHP:BAND:INT?</code>
Couplings	When Bandwidth of the parameter set is changed, this parameter also changes to that value
Preset	100 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	2000 MHz

ACP Power Integration Bandwidth

This column specifies the Measurement Noise Bandwidth used to calculate the power in the component carriers in the ACP measurement.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:ACPpower:BANDwidth[1] 2:INTEgration <freq></code> <code>[:SENSe]:CCARrier[0] 1 ... 15:ACPpower:BANDwidth[1] 2:INTEgration?</code>
Example	<code>:CCAR0:ACP:BAND:INT 20MHz</code> <code>:CCAR0:ACP:BAND:INT?</code>

Notes	Carrier sub op code, 1 is for BTS, 2 for MS. Default is BTS
Couplings	When either Bandwidth of the parameter set, Freq Range, or Direction is changed, the value of this parameter also changes as shown in the following table When Freq Range is FR1

Bandwidth	Downlink ACP Meas Noise BW (MHz)	Uplink ACP Meas Noise BW (MHz)
5 MHz	4.500	4.515
10 MHz	9.360	9.375
15 MHz	14.220	14.235
20 MHz	19.080	19.095
25 MHz	23.940	23.955
30 MHz	28.800	28.815
35 MHz	33.840	33.855
40 MHz	38.880	38.895

3 5G NR Mode
3.11 IQ Waveform Measurement

45 MHz	43.560	43.575
50 MHz	48.600	48.615
60 MHz	58.320	58.350
70 MHz	68.040	68.070
80 MHz	78.120	78.150
90 MHz	88.200	88.230
100 MHz	98.280	98.310

When Freq Range is FR2

Bandwidth	Downlink ACP Meas Noise BW (MHz)	Uplink ACP Meas Noise BW (MHz)
50 MHz	47.520	47.580
100 MHz	95.040	95.160
200 MHz	190.080	190.20
400 MHz	380.160	380.280
800 MHz	714.24	715.20
1600 MHz	1428.48	1429.44
2000 MHz	1704.96	1705.92

Preset	98.280 MHz 98.310 MHz
State Saved	Yes
Min	100 kHz
Max	2000 MHz

SEM Power Integration Bandwidth

This column specifies the integration bandwidth used to calculate the power in the component carriers in SEM measurement.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:SEMAsk:BANDwidth[1] 2:INTEgration <freq></code> <code>[:SENSe]:CCARrier[0] 1 ... 15:SEMAsk:BANDwidth[1] 2:INTEgration?</code>
Example	<code>:CCAR0:SEM:BAND:INT 20MHz</code> <code>:CCAR0:SEM:BAND:INT?</code>
Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS
Couplings	When Bandwidth of the parameter set is changed, this parameter also changes to that value
Preset	100 MHz
State Saved	Saved in instrument state

Min	100 kHz
Max	2000 MHz

SCS (Power Meas)

Queries the SCS (Power Meas), the smallest SCS among the enabled SCSs of the selected component carrier set with "[SCS Enabled](#)" on page 1547.

It is used to calculate the aggregated channel bandwidth when Power Reference is set to Aggregated Chan BW.

Power Integration Bandwidth values are not affected even if SCS (Power Meas) is changed.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:RGRid:PMSCs?</code>
Example	<code>:CCAR3:RGR:PMSC?</code>
Notes	Query-only Returns one of the following values: NONE, SCS15K, SCS30K, SCS60K, SCS120K, SCS240K, SCS480K, SCS960K

3.11.8.4 Meas Standard

The tab contains settings which let you configure the analyzer to match the measurement standard in your 5G NR signal.

The section entitled "Configure Preset" lets you configure the preset values for the Component Carriers. Once you have set all the controls in the "Configure Preset" section to the desired value, press the "Apply Preset (to all CCs)" control and your presets will be applied to each Component Carrier. Furthermore, any new Component Carriers will take on the same values you have applied.

NOTE

You must press **Apply Preset (to all CCs) or the values on the controls will *not* affect the Component Carriers.**

When you need to configure more parameters, select Advanced Preset Parameters to open a dialog and set advanced parameters for multiple measurements on one screen.

Bandwidth

This control is part of the "Configure Presets" section of **Meas Standard**. It lets you set the "[Bandwidth](#)" on page 2637 of each component carrier in the same way you

would do so using the table in the **Configure Comp Carriers** dialog on the **Component Carriers** tab.

Set the value you want for this control and the other controls in the “**Configure Preset**” section then press **Apply Preset (to all CCs)**.

NOTE

You must press **Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.**

Once you have applied this preset value, any new CCs created by setting the **"Number of Component Carriers" on page 2633** will also take on this value.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:CARRier[:BANDwidth] B5M B10M B15M B20M B25M B30M B35M B40M B45M B50M B60M B70M B80M B90M B100M B200M B400M B800M B1600M B2000M</code> <code>[:SENSe]:RADio:STANdard:PRESet:CARRier[:BANDwidth]?</code>
Example	<code>:RAD:STAN:PRES:CARR B5M</code> <code>:RAD:STAN:PRES:CARR?</code>
Dependencies	Selections other than 10 MHz, 20 MHz, 30 MHz, and 40 MHz are unavailable when "Uplink Carrier Mode" on page 2648 is Sidelink - V2X If you change "Uplink Carrier Mode" on page 2648 to Sidelink - V2X when this parameter is set to a value other than 10 MHz, 20 MHz, 30 MHz, or 40 MHz, it is forcefully set to 10 MHz
Preset	When N9085EM0E is not installed and N9085EM4E is installed: B10M Otherwise: B100M
State Saved	Yes
Range	5 MHz 10 MHz 15 MHz 20 MHz 25 MHz 30 MHz 35 MHz 40 MHz 45 MHz 50 MHz 60 MHz 70 MHz 80 MHz 90 MHz 100 MHz 200 MHz 400 MHz 800 MHz 1600 MHz 2000 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:RADio:STANdard:PRESet[:BANDwidth]</code>

Frequency Range

This control is part of the “Configure Presets” section of **Meas Standard**. It lets you set the **"Freq Range" on page 2638** of each component carrier in the same way you would do so using the table in the **Configure Comp Carriers** dialog on the **Component Carriers** tab.

Set the value you want for this control and the other controls in the “**Configure Preset**” section then press **Apply Preset (to all CCs)**.

NOTE

You must press **Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.**

Once you have applied this preset value, any new CCs created by setting the "Number of Component Carriers" on page 2633 will also take on this value.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:FREQuency:RANGe FR1 FR2</code> <code>[:SENSe]:RADio:STANdard:PRESet:FREQuency:RANGe?</code>
Example	<code>:RAD:STAN:PRES:FREQ:RANG FR1</code> <code>:RAD:STAN:PRES:FREQ:RANG?</code>
Dependencies	Available selections differ depending on Bandwidth as follows: <ul style="list-style-type: none"> - 50 MHz and 100 MHz: FR1 and FR2 - 200 MHz or wider: FR2 only - Other than above: FR1 only <p>When "Uplink Carrier Mode" on page 2648 is Sidelink - V2X, FR2 is unavailable</p>
Preset	FR1
State Saved	Yes
Range	FR1 FR2
Backwards Compatibility SCPI	<code>[:SENSe]:RADio:STANdard:PRESet:FRANge</code>

Duplex Mode

This control is part of the "Configure Presets" section of **Meas Standard**. It lets you set the Duplex Mode of each component carrier. Set the value you want for this control and the other controls in the "Configure Preset" section then press "Apply Preset (to all CCs)".

NOTE You must press **Apply Preset (to all CCs)** or the value on this controls will *not* affect the Component Carriers.

Once you have applied this preset value, any new CCs created by setting the "Number of Component Carriers" on page 2633 will also take on this value.

Two types of Duplex Mode (FDD and TDD) are supported.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:DMODE FDD TDD</code> <code>[:SENSe]:RADio:STANdard:PRESet:DMODE?</code>
Example	<code>:RAD:STAN:PRES:DMOD TDD</code> <code>:RAD:STAN:PRES:DMOD?</code>
Dependencies	Available selections depend on Frequency Range When FR1 is selected, both TDD and FDD are available. When FR2 is selected, only TDD is available

Preset	TDD
State Saved	Yes
Range	FDD TDD

SCS

This control is part of the “Configure Presets” section of **Meas Standard**. It lets you set the subcarrier spacing of each component carrier. Set the value you want for this control and the other controls in the “Configure Preset” section then press “Apply Preset (to all CCs)”.

NOTE

You must press **Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.**

Once you have applied this preset value, any new CCs created by setting the **“Number of Component Carriers” on page 2633** will also take on this value.

In 5G, subcarrier spacing is governed by $2^n * 15$ kHz subcarrier spacings (where n is 0, 1, 2, or 3). 15, 30, and 60 kHz subcarrier spacings are used for the lower frequency bands, and 60 and 120 kHz subcarrier spacings are used for the higher frequency bands.

Remote Command	<pre>[:SENSe]:RADio:STANdard:PRESet:SCS SCS15K SCS30K SCS60K SCS120K SCS480K SCS960K [:SENSe]:RADio:STANdard:PRESet:SCS? [:SENSe]:RADio:STANdard:PRESet:SCS:AUTO[:STATe] OFF ON 0 1 [:SENSe]:RADio:STANdard:PRESet:SCS:AUTO[:STATe]?</pre>
----------------	--

Example	<pre>:RAD:STAN:PRE:SCS SCS30K :RAD:STAN:PRE:SCS? :RAD:STAN:PRE:SCS:AUTO 0 :RAD:STAN:PRE:SCS:AUTO?</pre>
---------	---

Notes SCS will not be preset to the selected one until the action “Apply Preset (to All CCs)” is executed

Dependencies Available selections depend on a combination of Bandwidth and Frequency Range as follows

- When “Adjust Limit Mask for Freq Range” is set to a value other than “52.6 < f ≤ 71.0 GHz” (FR2-2):

FR	Bandwidth	SCS
FR1	5 MHz	15K*/30K
FR1	10 – 50 MHz	15K*/30K/60K
FR1	60 – 100 MHz	30K*/60K

FR2	50, 100, 200 MHz	60K*/120K
FR2	400 MHz	120K*
– When “Adjust Limit Mask for Freq Range” is set to “52.6 < f ≤ 71.0 GHz” (FR2-2):		
FR	Bandwidth	SCS
FR2	100 MHz	120K*
FR2	400 MHz	120K*/480K/960K
FR2	800, 1600 MHz	480K*/960K
FR2	2000 MHz	960K*
(*) When AUTO is selected, the narrowest available SCS is selected.		
Preset	SCS30K ON	
State Saved	Yes Yes	
Range	u = 0: 15 kHz u = 1: 30 kHz u = 2: 60 kHz u = 3: 120 kHz u = 5: 480 kHz u = 6: 960 kHz Auto Man	

RB Alloc Preset

This control is part of the “Configure Presets” section of **Meas Standard**. It lets you set the Resource Block Allocation Preset of each component carrier. Set the value you want for this control and the other controls in the “Configure Preset” section then press “Apply Preset (to all CCs)”.

NOTE

You must press Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.

Once you have applied this preset value, any new CCs created by setting the **“Number of Component Carriers” on page 2633** will also take on this value.

The RB Alloc Preset presets the Resource Block (RB) allocation mapping to a selected predefined pattern in the list:

“Fulfilled-xxx” is to fill out all maximum available RBs in each CC with one specified modulation type (Pi/2-BPSK | QPSK | 16 QAM | 64 QAM | 256 QAM | 1024 QAM), and “DL-NR-TM x.x” is to map RBs in each CC based on the NR Test Model definition according to the section 4.9.2 in 3GPP TS38.141-1 or -2.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:RBAlloc FQPSK FQAM16 FQAM64 FQAM256 FQAM1024 DLTm1DOT1 DLTm1DOT2 DLTm2 DLTm2Q16 DLTm2QPS DLTm2A DLTm2B DLTm3DOT1 DLTm3DOT1Q16 DLTm3DOT1QPS DLTm3DOT1A DLTm3DOT1B DLTm3DOT2 DLTm3DOT3 FPIBPSK DLTm1DOT1P1</code>

Advanced Preset Parameters

Lets you access advanced preset parameters on one screen.

Uplink Carrier Mode

Allows you to select the uplink carrier mode: either Normal Uplink or Sidelink - V2X.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:ULINK:CARRier NORMa1 V2X</code> <code>[:SENSe]:RADio:STANdard:PRESet:ULINK:CARRier?</code>
Example	<code>RAD:STAN:PREs:ULIN:CARR NORM</code> <code>RAD:STAN:PREs:ULIN:CARR?</code>
Dependencies	Available when the required license is installed and Direction is Uplink
Preset	When N9085EMOE is not installed and N9085EM4E is installed: V2X Otherwise: NORMa1
State Saved	Saved
Range	Normal Uplink Sidelink-V2X

DL FR1 NR-TM Reference Standard Selection

Enables you to select the 3GPP Standard for the DL FR1 TDD NR-TM lists of Resource Block Allocation Preset to be referred to; one is 3GPP TS38.141-1 and the other is 3GPP TS37.141 BC3 CS16/17, which define different TDD burst On/Off profiles.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:DLINK:NRTM TS38 TS37CS1617</code> <code>[:SENSe]:RADio:STANdard:PRESet:DLINK:NRTM?</code>
Example	<code>RAD:STAN:PREs:DLIN:NRTM TS38</code> <code>RAD:STAN:PREs:DLIN:NRTM?</code>

Dependencies	Grayed out when Radio Direction is Uplink.
Couplings	Values to be preset will not be preset until the action “Apply Preset (to All CCs)” is executed.
Preset	TS38
State Saved	Yes
Range	TS38.141-1 TS37.141 BC3 CS16/17

OFDM Type

This control is part of the “Preset for Mod Analysis” section of the Advanced Preset Parameters dialog. It lets you specify the OFDM Type to configure preset values for the Component Carriers:

- CP-OFDM
- DFT-s-OFDM

Set the value you want for this control and the other controls in the “Configure Preset” section, and then press “Apply Preset (to all CCs)”.

NOTE

You must press **Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.**

Once you have applied this preset value, any new CCs created by setting the Number of Component Carriers will also take on this value.

This parameter is valid only for the Modulation Analysis measurement.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:OTYPe CPOFdm DFTSofdm</code> <code>[:SENSe]:RADio:STANdard:PRESet:OTYPe?</code>
Example	<code>:RAD:STAN:PRES:OTYP CPOF</code> <code>:RAD:STAN:PRES:OTYP?</code>
Dependencies	DFT-s-OFDM is grayed out when Radio Direction is Downlink DFT-s-OFDM is grayed-out when "Uplink Carrier Mode" on page 2648 is Sidelink - V2X
Couplings	Values to be preset will not be preset until the action “Apply Preset (to All CCs)” is executed
Preset	<code>CPOFdm</code>
State Saved	Yes
Range	CP-OFDM DFT-s-OFDM

Adjust Limit Mask for Freq Range

This control is part of the “Preset for ACP, SEM, Spur, Tx On|Off Power” section of the Advanced Preset Parameters dialog. It lets you specify the frequency range for

preset.

Set the value you want for this control and the other controls in the “Configure Preset” section, and then press “Apply Preset (to all CCs)”.

NOTE

You must press *Apply Preset (to all CCs)* or the value on this controls will *not* affect the Component Carriers.

When in Auto, this value changes when f value is changed, where f is the center frequency of Component Carrier 0. Values to be preset will be preset to the values described in the Values for Meas Standard section when Apply Preset is executed.

When in Manual, values to be preset will be preset to the values described in Values or Meas Standard according to this value when Apply Preset is executed.

This parameter is valid for the ACP, SEM, Transmit On|Off Power, and Spurious Emissions measurements.

Remote Command `[:SENSe]:RADio:STANdard:PRESet:ADJJust:FRANge NONE | FT01 | F1T03 | F3T04P2 | F4P2T06 | F6T07 | F24P25T029P5 | F37T040 | F43T048 | F52T071`
`[:SENSe]:RADio:STANdard:PRESet:ADJJust:FRANge?`
`[:SENSe]:RADio:STANdard:PRESet:ADJJust:FRANge:AUTO OFF | ON | 0 | 1`
`[:SENSe]:RADio:STANdard:PRESet:ADJJust:FRANge:AUTO?`

Example `:RAD:STAN:PRES:ADJ:FRAN F1T03`
`:RAD:STAN:PRES:ADJ:FRAN?`
`:RAD:STAN:PRES:ADJ:FRAN:AUTO 1`
`:RAD:STAN:PRES:ADJ:FRAN:AUTO?`

Dependencies Available selections depend on Frequency Range and Bandwidth

When Freq Range = FR1

- $f \leq 1.0$ GHz
- $< f \leq 3.0$ GHz
- $3.0 < f \leq 4.2$ GHz
- $4.2 < f \leq 6.0$ GHz
- $6.0 < f \leq 7.125$ GHz

When Freq Range = FR2 and Bandwidth = 50 or 200 MHz

- $24.25 < f \leq 29.5$ GHz
- $37.0 < f \leq 43.5$ GHz
- $43.5 < f \leq 48.2$ GHz

When Freq Range = FR2 and Bandwidth = 100 or 400 MHz

3 5G NR Mode
3.11 IQ Waveform Measurement

	<ul style="list-style-type: none"> - 24.25 < f ≤ 29.5 GHz - 37.0 < f ≤ 43.5 GHz - 43.5 < f ≤ 48.2 GHz - 52.6 < f ≤ 71.0 GHz <p>When Freq Range = FR2 and Bandwidth = 800 MHz or wider</p> <ul style="list-style-type: none"> - 52.6 < f ≤ 71.0 GHz
Couplings	<p>When in Auto, this value changes when f value is changed, where f is the center frequency of Component Carrier 0</p> <p>Adjust Limit Mask for freq Range will not be preset to the selected one until the action “Apply Preset (to All CCs)” is executed</p>
Preset	<p>Automatically selected</p> <p>The selection depends on which listed range the CC0 center freq is in</p> <p>ON</p>
State Saved	<p>Yes</p> <p>Yes</p>
Range	<p>None f ≤ 1.0 GHz 1.0 < f ≤ 3.0 GHz 3.0 < f ≤ 4.2 GHz 4.2 < f ≤ 6.0 GHz 6.0 < f ≤ 7.125 GHz 24.25 < f ≤ 29.5 GHz 37.0 < f ≤ 43.5 GHz 43.5 < f ≤ 48.2 GHz 52.6 < f ≤ 71.0 GHz</p>

BS Type

This control is part of the “Preset for ACP, SEM, Spur, Tx On|Off Power” section of the Advanced Preset Parameters dialog. It lets you specify the BS Type for preset:

- 1-C (FR1 Conducted)
- 1-O (FR1 Radiated)
- 2-O (FR2 Radiated)

Set the value you want for this control and the other controls in the “Configure Preset” section, and then press “Apply Preset (to all CCs)”.

NOTE

You must press **Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.**

This parameter is valid for the ACP, SEM, Transmit On|Off Power, and Spurious Emissions measurements.

Remote Command	<pre>[:SENSe]:RADio:STANdard:PRESet:DLINK:BS:TYPE FR1C FR1O FR2O [:SENSe]:RADio:STANdard:PRESet:DLINK:BS:TYPE?</pre>
----------------	---

Example	<code>:RAD:STAN:PRES:DLIN:BS:TYPE FR1C</code> <code>:RAD:STAN:PRES:DLIN:BS:TYPE?</code>
Dependencies	Grayed out when Radio Direction is Uplink
Couplings	Values to be preset will not be preset until the action “Apply Preset (to All CCs)” is executed
Preset	<code>FR1C</code>
State Saved	Yes
Range	1-C (FR1 Conducted) 1-0 (FR1 Radiated) 2-0 (FR2 Radiated)

BS Category

This control is part of the “Preset for ACP, SEM, Spur, Tx On|Off Power” section of the Advanced Preset Parameters dialog. It lets you specify the BS Category for preset:

- Category A Wide Area BS
- Category B Wide Area BS
- Category A Medium Range BS
- Category B Medium Range BS
- Category A Medium Range BS (Low Power rated)
- Category B Medium Range BS (Low Power rated)
- Category A Local Area BS
- Category B Local Area BS

Set the value you want for this control and the other controls in the “Configure Preset” section, and then press “Apply Preset (to all CCs)”.

NOTE

You must press **Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.**

This parameter is valid for the ACP, SEM, Transmit On|Off Power, and Spurious Emissions measurements.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:DLINK:BS:CATegory AWARea BWARea AMRange BMRRange AMRLow BMRLow ALARea BLARea</code> <code>[:SENSe]:RADio:STANdard:PRESet:DLINK:BS:CATegory?</code>
Example	<code>:RAD:STAN:PRES:DLIN:BS:CAT BWAR</code> <code>:RAD:STAN:PRES:DLIN:BS:CAT?</code>

Dependencies	Grayed-out when Radio Direction is Uplink
Couplings	Values to be preset will not be preset to the selected one until the action “Apply Preset (to All CCs)” is executed
Preset	BWARea
State Saved	Yes
Range	Category A Wide Area BS Category B Wide Area BS Category A Medium Range BS Category B Medium Range BS Category A Medium Range BS (Low Power rated) Category B Medium Range BS (Low Power rated) Category A Local Area BS Category B Local Area BS

Assumed Adjacent Channels

This control is part of the “Preset for ACP, Mod Analysis” section of the Advanced Preset Parameters dialog. It lets you set the Assumed Adjacent Channels for carrier configuration preset. Set the value you want for this control and the other controls in the “Configure Preset” section, then press “Apply Preset (to all CCs)” to execute preset. See the Values for Meas Standard section for the parameters to be preset.

Downlink

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:DLINK:ACHannel[:TYPE] NR EUTRa NREutra</code> <code>[:SENSe]:RADio:STANdard:PRESet:DLINK:ACHannel[:TYPE]?</code>
Example	<code>:RAD:STAN:PRES:DLIN:ACH NR</code> <code>:RAD:STAN:PRES:DLIN:ACH?</code>
Dependencies	UTRA and NR+UTRA are grayed-out when " Uplink Carrier Mode " on page 2648 is Sidelink - V2X
Preset	NR
State Saved	Yes
Range	NR (same BW) E-UTRA NR + E-UTRA

Uplink

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:ULINK:ACHannel[:TYPE] NR UTRa NRUTra</code> <code>[:SENSe]:RADio:STANdard:PRESet:ULINK:ACHannel[:TYPE]?</code>
Example	<code>:RAD:STAN:PRES:ULIN:ACH NR</code> <code>:RAD:STAN:PRES:ULIN:ACH?</code>
Preset	NR
State Saved	Yes
Range	NR (same BW) UTRA NR + UTRA

UE Power Class

This control is part of the “Preset for ACP, Mod Analysis” section of the Advanced Preset Parameters dialog. It lets you select the UE Power Class for preset from Power Class 1 to 4.

Set the value you want for this control and the other controls in the “Configure Preset” section, and then press “Apply Preset (to all CCs)”.

NOTE

You must press **Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.**

This parameter is valid for the ACP and Mod Analysis measurement.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:ULINK:PCLass CLASS1 ... CLASS4</code> <code>[:SENSe]:RADio:STANdard:PRESet:ULINK:PCLass?</code>
Example	<code>:RAD:STAN:PRES:ULIN:PCL CLASS3</code> <code>:RAD:STAN:PRES:ULIN:PCL?</code>
Dependencies	Grayed out when Radio Direction is Downlink Power Class 4 is grayed out when Frequency Range is FR1 Power Class 1, 2, and 4 are grayed-out when "Uplink Carrier Mode" on page 2648 is Sidelink - V2X
Preset	<code>CLASS3</code>
State Saved	Yes
Range	1 2 3 4

Uplink Channel Type

This control is part of the “Preset for Tx On|Off Power” section of the Advanced Preset Parameters dialog. It lets you set the Uplink Channel Type to preset parameters for the Transmit On|Off Power measurement. Set the value you want for this control and the other controls in the “Configure Preset” section, then press “Apply Preset (to all CCs)” to execute preset. See the Values for Meas Standard section for the parameters to be preset.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:ULINK:CTYPe NONE PUS PRA4 PRA160S15 PRA160S30 PRA12 PRA123S15 PRA123S30 SRS PRA0S60 PRA0S120</code> <code>[:SENSe]:RADio:STANdard:PRESet:ULINK:CTYPe?</code>
Example	<code>:RAD:STAN:PRES:ULIN:CTYP PUS</code> <code>:RAD:STAN:PRES:ULIN:CTYP?</code>
Dependencies	Available selections differ depending on the combination of Freq Range and Duplex Mode as follows:

3 5G NR Mode
3.11 IQ Waveform Measurement

	<p>When Freq Range is FR1 and Duplex Mode is FDD: - PUSCH, PRACH Config Index4, PRACH Config Index160 and SRS</p> <p>When Freq Range is FR1 and Duplex Mode is TDD: - PUSCH, PRACH Config Index12, PRACH Config Index123 and SRS</p> <p>When Freq Range is FR2: - PUSCH, PRACH Config Index0, SRS</p>
Preset	PUS
State Saved	Yes
Range	PUSCH PRACH Config Index 4 PRACH Config Index 160 (15 kHz SCS) PRACH Config Index 160 (30 kHz SCS) PRACH Config Index 12 PRACH Config Index 123 (15 kHz SCS) PRACH Config Index 123 (30 kHz SCS) PRACH Config Index 0 (60 kHz SCS) PRACH Config Index 0 (120 kHz SCS) SRS

More Advanced Preset Parameters

Enables you to configure more advanced Apply Preset features.

Include RB Alloc Preset for Mod Analysis

Enables you to select whether or not RB Alloc Preset is preset when Apply Preset is executed.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:INCLude:EVM:RBALloc OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:INCLude:EVM:RBALloc?</code>
Example	<code>:RAD:STAN:PRES:INCL:EVM:RBAL 1</code> <code>:RAD:STAN:PRES:INCL:EVM:RBAL?</code>
Notes	When Exclude is selected, the indicator “Exclude EVM RB Alloc” appears on the Meas Setup menu panel
Preset	ON
State Saved	Yes

Include Gate Source

Enables you to select whether or not Gate Source is preset when Apply Preset is executed.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:INCLude:EGATe:SOURce OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:INCLude:EGATe:SOURce?</code>
Example	<code>:RAD:STAN:PRES:INCL:EGAT:SOUR 1</code> <code>:RAD:STAN:PRES:INCL:EGAT:SOUR?</code>
Preset	ON
State Saved	Yes

Include Periodic Timer Period

Enables you to select whether or not Periodic Timer Period is preset when Apply Preset is executed.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:PERiod OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:PERiod?</code>
Example	<code>:RAD:STAN:PRES:INCL:FRAM:PER 1</code> <code>:RAD:STAN:PRES:INCL:FRAM:PER?</code>
Preset	ON
State Saved	Yes

Include Periodic Timer Sync Source

Enables you to select whether or not Periodic Timer Sync Source is preset when Apply Preset is executed.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:SYNC[:SOURce] OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:SYNC[:SOURce]?</code>
Example	<code>:RAD:STAN:PRES:INCL:FRAM:SYNC 1</code> <code>:RAD:STAN:PRES:INCL:FRAM:SYNC?</code>
Preset	ON
State Saved	Yes

Include Periodic Timer Sync Holdoff

Enables you to select whether or not Periodic Timer Sync Holdoff is preset when Apply Preset is executed.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:SYNC:HOLDoff OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:SYNC:HOLDoff?</code>
Example	<code>:RAD:STAN:PRES:INCL:FRAM:SYNC:HOLD 1</code> <code>:RAD:STAN:PRES:INCL:FRAM:SYNC:HOLD?</code>
Preset	ON
State Saved	Yes

Apply Preset (to All CCs)

This is the same as the Apply Preset (to All CCs) control on the Meas Standard menu panel tab under Meas Standard.

See ["Apply Preset \(to All CCs\)" on page 2657](#).

Apply Preset (to All CCs)

When you press this control, parameters of each component carrier are configured to the values set on the ["Bandwidth" on page 2643](#), ["Frequency Range" on page 2644](#), ["Duplex Mode" on page 2644](#), ["SCS" on page 2645](#) and ["RB Alloc Preset" on page 2646](#) controls in the "Configure Presets" section of the menu panel. These values will also be used for any subsequent Component Carriers created.

NOTE

You must press **"Apply Preset (to all CCs)"** or the values on the controls in the "Configure Presets" section of the menu panel will *not* affect the Component Carriers.

Remote
Command

`[:SENSe] :RADio:STANdard:PRESet:IMMediate`

Example

`:RAD:STAN:PRES:IMM`

Notes

Whenever any preset parameter is changed, including the following cases, the color of this control changes to amber, until "Apply Preset" is executed again

- Start-up
- Mode Preset
- Recall

Values for Meas Standard

Meas Standard Setting Parameters for Apply Preset

The following parameters in Meas Setup > Meas Standard let you configure the preset values for Component Carriers.

Direction	Downlink	Uplink
Bandwidth	5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80, 90, 100, 200, 400, 800, 1600, 2000 MHz	5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80, 90, 100, 200, 400, 800, 1600, 2000 MHz

Frequency Range	FR1 FR2	FR1 FR2
Duplex Mode	FDD TDD	FDD TDD
SCS	$\mu = 0$ (15 kHz), 1(30 kHz), 2 (60 kHz), 3 (120 kHz), 5 (480 kHz), 6 (960 kHz)	$\mu = 0$ (15 kHz), 1(30 kHz), 2 (60 kHz), 3 (120 kHz), 5 (480 kHz), 6 (960 kHz)
RB Alloc Preset	Fulfilled QPSK, Fulfilled 16 QAM, Fulfilled 64 QAM, Fulfilled 256 QAM, 1024 QAM NR-TM1.1 (port 0), 1.1 (port 1), 1.1 (2 layers),1.2, 2 (64 QAM/16 QAM/QPSK), 2a, 2b, 3.1 (64 QAM/16 QAM/QPSK), 3.1a, 3.1b, 3.2, 3.3	Fulfilled Pi/2-BPSK (for DFT-s-OFDM only), Fulfilled QPSK, Fulfilled 16 QAM, Fulfilled 64 QAM, Fulfilled 256 QAM
UL Carrier Mode	n/a	Normal Uplink, Sidelink-V2X
OFDM Type (for Mod Analysis)	CP-OFDM	CP-OFDM, DFT-s-OFDM
Adjust Limit Mask for Freq Range (for ACP, SEM, PvT and Spur only)	None, $f \leq 1.0$ GHz (FR1), $1.0 < f \leq 3.0$ GHz (FR1), $3.0 < f \leq 4.2$ GHz (FR1), $4.2 < f \leq 6.0$ GHz (FR1), $6.0 < f \leq 7.125$ GHz (FR1), $24.25 < f \leq 29.5$ GHz (FR2), $37.0 < f \leq 43.5$ GHz (FR2), $43.5 < f \leq 48.2$ GHz (FR2), $52.6 < f \leq 71.0$ GHz (FR2)	None, $f \leq 1.0$ GHz (FR1), $1.0 < f \leq 3.0$ GHz (FR1), $3.0 < f \leq 4.2$ GHz (FR1), $4.2 < f \leq 6.0$ GHz (FR1), $6.0 < f \leq 7.125$ GHz (FR1), $24.25 < f \leq 29.5$ GHz (FR2), $37.0 < f \leq 43.5$ GHz (FR2), $43.5 < f \leq 48.2$ GHz (FR2), $52.6 < f \leq 71.0$ GHz (FR2)
BS Type (for ACP, SEM, PvT and Spur only)	1-C (FR1 Conducted), 1-O (FR1 Radiated), 2-O (FR2 Radiated)	n/a
BS Category (for ACP, SEM, PvT, and Spur only)	Cat A Wide Area BS, Cat B Wide Area BS, Cat A Medium Range BS, Cat B Medium Range BS, Cat A Medium Range BS (Low Pr), Cat B Medium Range BS (Low Pr), Cat A Local Area BS, Cat B Local Area BS	n/a
Assumed Adj Channels (for ACP, FR1)	NR (same BW), E-UTRA, NR + E-UTRA	NR (same BW), UTRA, NR+UTRA
UE Power Class (for ACP: FR1 and Mod Analysis: FR2 UE IBE)	n/a	When Freq Range is FR1: Power Class 2, Power Class 3 When Freq Range is FR2: Power Class 1, Power Class 2,

3 5G NR Mode
3.11 IQ Waveform Measurement

UL Channel Type (for Tx On Off Power)	n/a	Power Class 3, Power Class 4 When Freq Range is FR1: PUSCH, PRACH Config Index 4 (FDD), PRACH Config Index 160 (15 kHz SCS, FDD), PRACH Config Index 160 (30 kHz SCS, FDD), PRACH Config Index 12 (TDD), PRACH Config Index 123 (15 kHz SCS, TDD), PRACH Config Index 123 (30 kHz SCS, TDD), SRS When Freq Range is FR2: PUSCH, PRACH Config Index 0 (60 kHz SCS), PRACH Config Index 0 (120 kHz SCS), SRS
--	-----	--

TS38.521-2 v.17.0.0 (v.2022-09) The following PvT limit requirements are still FFS:

Clause 6.3.3.2, Table 6.3.3.2.5-3: Test Tolerance for OFF power ... still FFS.

Clause 6.3.3.2, Table 6.3.3.2.5-4: Test Tolerance for ON power ... still FFS.

Clause 6.3.3.4, Table 6.3.3.4.5-1: PRACH time mask ... for On power and On power
Tolerance ... still FFS.

Clause 6.3.3.6 SRS time mask ... still all FFS.

When "[Apply Preset \(to All CCs\)](#)" on page 2657 is pressed, related measurement
parameters and Gate parameters are changed to the values described in the
following sections in this chapter.

Reference Standard version and ACP & SEM table indicator

The following reference 3GPP test spec doc with its version number, ACP and SEM
table numbers are displayed in the **Advanced Preset Parameters** dialog menu.

e.g.)

3GPP TS38.141-1 v.17.7.0 (2022-09)

		v.17.0.0 (2022-09)		

When UL Carrier Mode = Sidelink / V2X:

Preset parameters		Reference spec doc, ACP and SEM table in the menu		
FR	Assumed Adjacent Channel (ACLR)	Test Spec	ACP (*)	SEM
FR1	NR (same BW)	TS38.521-1	Table 6.5E.2.4.1.5-2	Table 6.5E.2.2.1.5-1
		v.17.6.1 (2022-10)		

(*) ACP reference table selection represents the Relative Limit for Outer Offsets. (The table numbers for Absolute limits, Test Tolerances, and the limits for Inner Offsets/CACLR are not displayed.)

Measurement-Global parameters

The following parameters are configured as preset values.

- ["Configure Component Carriers" on page 2664](#)
- ["Trigger/Gate Parameters" on page 2664](#)

Configure Component Carriers

When Direction = Uplink:

Preset Configuration	Preset Value
UL Carrier Mode	Sidelink
Normal Uplink	Disabled (for all CCs)
Sidelink / V2X	Enabled (for all CCs)

Trigger/Gate Parameters

When executing "Apply Preset", preset the following parameters:

Trigger menu	Parameter	Preset values		
		Downlink (*) FR1	Downlink (*) FR2	Uplink

Trigger	Select Trigger Source (*2)	(no preset)	(no preset)	(no preset)
	Period (Periodic Timer) (*3)	5.000 ms	1.250 ms	10.000 ms
	(Periodic) Sync Source (*4)	RF Burst	RF Burst	RF Burst
Gate Source	Select Gate Source	Periodic	Periodic	Periodic
	Period (Periodic Timer) (*3)	5.000 ms	1.250 ms	10.000 ms
	(Periodic) Sync Source (*4)	RF Burst	RF Burst	RF Burst
Gate Settings	Sync Holdoff	On, 250 us	On, 250 us	On, 250 us
	Gate (*5)	On	On	(no preset)
	Gate Delay	5.000 ms	1.250 ms	(no preset)
	Gate Length	3.700 ms (*6) or 2.700 ms (*6)	927.5 us	(no preset)
Periodic Sync Src	Gate Holdoff	(no preset)	(no preset)	(no preset)
	Select Periodic Trigger Sync Source (*4)	RF Burst	RF Burst	RF Burst
	Absolute Trig Level	(no preset)	(no preset)	(no preset)
Auto Holdoff	Trigger Slope	(no preset)	(no preset)	Positive
	Trig Holdoff	(no preset)	(no preset)	On, 250 us (*7)
	Holdoff Type	(no preset)	(no preset)	Below (*7)

Notes:

(*1) For Downlink case, these values are preset with the Apply Preset action when **"RB Alloc Preset" on page 2646** is any of NR-TM and **"Duplex Mode" on page 2644** is TDD.

(*2) Trigger Source is a separate parameter in each measurement, and is not preset with the Apply Preset action. Note that in the Tx On/Off Power measurement, it is forcefully changed to Periodic when the direction is switched to Uplink or to External 1 when the direction is switched to Downlink except for models with the H1G option. With the H1G option, it is changed to either External 1 (when Info BW \leq 255 MHz) or External 3 (when Info BW \geq 256 MHz) depending on the Info BW determined by the component carrier configuration.

(*3) Periodic Trigger Period and Gate Period are the same/shared parameter, so called "Periodic Timer Period".

(*4) Periodic Trigger Sync Source and Periodic Gate Sync Source are the same/shared parameter.

(*5) Gate is preset to Off with the Apply Preset action when **"Duplex Mode" on page 2644** is FDD.

(*6) Gate Length preset value for DL FR1 depends on **"DL FR1 NR-TM Reference Standard Selection" on page 2357** under the Advanced Preset Parameters menu: 3.700 ms for TS38.141-1 or 2.700 ms for TS37.141 BC3 CS16/17.

(*7) These Trig Holdoff & Holdoff Type settings make the trigger holdoff wait for an OFF power period at least 250 us (in any burst configuration preset in Uplink), and then triggers at the beginning of the power raise timing (with Trigger Slope = Positive) of the Burst ON power as expected. This is to avoid an unexpected triggering with other random power up or down.

IQ Waveform

When executing Apply Preset, preset the following parameters:

- BW > Settings tab > Digital IF BW: Auto
- BW > Settings tab > Filter Type: Flattop
- Frequency > Settings tab, execute Adjust Center Frequency to Carrier Config action (which presets Digital IF BW in the BW menu to Auto)

3.11.8.5 Advanced

Contains advanced functions that are used for specific applications. These settings should not be changed for most measurements.

This tab does not appear in VXT.

Phase Noise Optimization

Sets the LO (local oscillator) phase noise behavior for various desired operating conditions.

Remote Command	<pre>[:SENSe]:WAVeform:FREQuency:SYNTHeSis[:STATe] 1 ... 5</pre> <p>For the meaning of each numeric option value, see "Parameter Options & Installed Options" on page 2535 below</p> <pre>[:SENSe]:WAVeform:FREQuency:SYNTHeSis[:STATe]?</pre>
Example	<pre>:WAV:FREQ:SYNT 2</pre> <p>Selects optimization for best wide offset phase noise</p> <pre>:WAV:FREQ:SYNT:AUTO ON</pre>
Dependencies	<p>Does not appear in all models. For models that do not display this control, the SCPI command is accepted for compatibility, but no action is taken</p> <p>This control is not available in VXT models SP900B/11A</p>
Preset	<p>Because this function is in AUTO after Preset, the state of this function after Preset will be automatically calculated</p> <pre>ON</pre>

Annotation	EPO: Balanced Best Wide Fast Best Close Best Spurs Other than EPO: Best Close Best Wide Fast Found in the Meas Bar under PNO When not in Auto, label changes to #PNO

Parameter Options & Installed Options

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 2536	1	<ul style="list-style-type: none"> In instruments with EPO, balances close-in phase noise with spur avoidance In instruments without EPO optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 2537	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 2537	3	Optimizes LO for tuning speed
"Best Close-in" on page 2536	4 or 1*	<ul style="list-style-type: none"> In instruments with EPO, emphasizes close-in phase noise performance without regard to spur avoidance In instruments without EPO, this setting is accepted but no action is taken
"Best Spurs" on page 2536	5	<ul style="list-style-type: none"> In instruments with EPO, emphasizes spur avoidance over close-in phase noise performance In instruments without EPO, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EPO installation. See ["Best Close-in" on page 2536](#) below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 2537 is identical in effect to "Best Close-in" on page 2536.

Best Close-in

Without option EPO

`:FREQ:SYNT 1`

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EPO

`:FREQ:SYNT 4`

In instruments with Option EPO, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 2536 setting, parameter 1 selects "Balanced" on page 2536 in EPO instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 2536, which is usually not as good a choice as "Balanced" on page 2536.

Balanced

`:FREQ:SYNT 1`

In instruments with EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Best Spurs

`:FREQ:SYNT 5`

In instruments with EPO, the LO is configured for better phase noise than the "Best Wide-offset" on page 2537 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 2536 case mostly within ± 1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 2536 case at better than -90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

`:FREQ:SYNT 2`

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "[Fast Tuning" on page 2537](#) refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EP0, this is the same configuration as "[Best Spurs" on page 2536](#). It is available with the "[Fast Tuning" on page 2537](#) label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "[Fast Tuning" on page 2537](#) option, the settings for "[Best Close-in" on page 2536](#) are used if "[Fast Tuning" on page 2537](#) is selected. This gives the fastest possible tuning for that hardware set.)

Auto

`:FREQ:SYNT:AUTO ON`

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EPO Models with option EPO have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz Span > 114.1 MHz, <i>or</i> RBW > 800 kHz RBW > 290 kHz, <i>or</i> Span > 4.2 MHz Other conditions	"Balanced" on page 2536 "Fast Tuning" on page 2537 "Best Wide-offset" on page 2537 "Balanced" on page 2536
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, <i>or</i> RBW > 1.9 MHz, <i>or</i> Source Mode is set to "Tracking" Center frequency is < 195 kHz, <i>or</i> CF >= 1 MHz and Span <= 1.3 MHz and RBW <= 75 kHz All other conditions	"Fast Tuning" on page 2537 "Best Close-in" on page 2536 "Best Wide-offset" on page 2537
EP2 Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 2536; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)	CF < 130 kHz, <i>or</i> CF > 12 MHz and Span < 495 kHz and RBW < 40 kHz Span > 22 MHz, <i>or</i> RBW > 400 kHz, <i>or</i> CF ≤ 12 MHz and Span < 495 kHz and RBW < 23 kHz All other conditions	"Best Close-in" on page 2536 "Fast Tuning" on page 2537 "Best Wide-offset" on page 2537
EP4 (available in CXA for improved phase noise)	Span > 101 MHz <i>or</i> RBW > 1.15 MHz <i>or</i> Source Mode is set to "Tracking" CF is < 109 kHz <i>or</i> CF >= 4.95 MHz and Span <= 666 kHz and RBW < 28 kHz	"Fast Tuning" on page 2537 "Best Close-in" on page 2536

Models with Option	Conditions	Selection
	All other conditions	"Best Wide-offset" on page 2537
All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 2537 are actually the same as "Best Close-in" on page 2536, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning	Span > 12.34 MHz, or RBW > 250 kHz, or Source Mode is set to "Tracking"	"Fast Tuning" on page 2537
	Center frequency is < 25 kHz, or CF >= 1 MHz and Span <= 141.4 kHz and RBW <= 5 kHz	"Best Close-in" on page 2536
	All other conditions	"Best Wide-offset" on page 2537

In all the above cases:

- The RBW to be used in the calculations is the equivalent –3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP0	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP1	1	Best Close-in	[offset < 140 kHz]
	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]

Option	Option #	Phase Noise Option	Range
EP2, EP3, EP5	1	Best Close-in	[offset < 70 kHz]
	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
EP4	1	Best Close-in	[offset < 90 kHz]
	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

ADC Dither

Toggles the dither function On and Off. The dither function improves linearity for low level signals, at the expense of a higher noise floor.

The reduced clipping-to-noise ratio results in higher noise because the clipping level of the ADC relative to the front terminals remains unchanged with the introduction of dither. The enhanced linearity is mostly improved scale fidelity.

With dither on, the third-order distortions are usually invisible for mixer levels below -35 dBm. With dither off, these distortions can be visible, with typical power levels of -110 dBm referred to the mixer. Detection nonlinearity can reach 1 dB for dither off at mixer levels around -70 dBm and lower, while the specified nonlinearity is many times smaller with dither on.

Remote Command	<pre>[:SENSe]:WAVeform:ADC:DITHer[:STATe] OFF ON 0 1 [:SENSe]:WAVeform:ADC:DITHer[:STATe]? [:SENSe]:WAVeform:ADC:DITHer:AUTO[:STATe] OFF ON 0 1 [:SENSe]:WAVeform:ADC:DITHer:AUTO[:STATe]?</pre>
Example	<pre>:WAV:ADC:DITH ON :WAV:ADC:DITH? :WAV:ADC:DITH:AUTO ON :WAV:ADC:DITH:AUTO?</pre>
Notes	<p>The dither function improves linearity for low level signals, at the expense of a higher noise floor</p> <p>Sets ADC dithering to automatically select whether dithering is needed</p> <p>The dither function improves linearity for low level signals, at the expense of a higher noise floor</p>

Range	ON OFF

	Auto Man
Backwards Compatibility SCPI	<code>[:SENSe] :WAVeform:WBIF:ADC:DITHer</code> <code>[:SENSe] :WAVeform:PDITHer</code>

LO Dither

When **LO Dither** is turned on, the local oscillator frequency is rapidly changed by small, random amounts. This helps spread the power of spurious signals within the passband, which lowers their level, thus increasing dynamic range. This is only required in very wide passbands, so this feature only appears with Option H1G.

Remote Command	<code>[:SENSe] :WAVeform:LO:DITHer [:STATe] ON OFF 1 0</code> <code>[:SENSe] :WAVeform:LO:DITHer [:STATe] ?</code>
Example	<code>:WAV:LO:DITH 1</code> <code>:WAV:LO:DITH?</code>
Dependencies	<p>Only available when the instrument has the Option H1G installed. If you try to turn ON LO Dither in any other case, an error message is generated, -241, "Hardware missing; Option H1G required"</p> <p>Only appears in some Modes (for example, VMA and IQ Analyzer)</p> <p>The LO Dither function is turned OFF and grayed-out when the IF Path is set to a path other than 1 GHz. If you press the grayed-out control, a warning message "LO Dither only available with IF Path 1 GHz" is shown. If you try to set LO Dither to ON remotely while it is grayed-out, a message "-221, Settings conflict; LO Dither only available with IF Path 1 GHz" is returned</p> <p>When LO Dither is turned ON, the Phase Noise Optimization control is grayed-out. If you try to change the PNO value via front panel or SCPI in that case, an error is generated, "LO Dither must be turned off to change this value"</p>
Couplings	<p>As with most parameters with an AUTO state, AUTO COUPLE sets it to Auto, which then selects AUTOorange. Setting any specific value (AUTOorange, LOW or HIGH) sets the AUTO state to false</p> <p>When LO Dither is turned ON, Phase Noise Optimization is set to "Best Close-In". If the Phase Noise Optimization value changes due to turning on LO Dither, a warning message "Phase Noise Optimization changed due to LO Dither activation" is displayed</p>
Preset	OFF

IF Gain

Selects the range of IF gain.

When in **AUTOorange** mode, the IF checks its range once for data acquisition, to provide the best signal to noise ratio. You can specify the range for the best speed, and optimize for noise or for large signals.

When **IF Gain** is set to **AUTOorange**, the IF Gain is set to **HIGH** initially for each chunk of data. The data is then acquired. If the IF overloads, then the IF Gain is set to **LOW** and the data is re-acquired. Because of this operation, the **AUTOorange** setting requires more measurement time, as the instrument checks/resets its range. You can get faster measurement speed by forcing the range to either the **HIGH** or **LOW** gain setting, *but* you must ensure that your measurement conditions will not overload the IF (in the **HIGH** gain range), that your signals are well above the noise floor (for the **LOW** gain range), and that the signals are not changing.

When **Digital Bus Out** (under the **Input/Output** menu) is **ON**, the IF Gain State **AUTOorange** selection is not allowed. Thus, in this case IF Gain State will be set to **LOW**.

This only applies to the RF input. It does not apply to baseband I/Q input.

Remote Command	<pre>[:SENSe]:WAVeform:IF:GAIN[:STATe] AUTOorange LOW HIGH OTHER [:SENSe]:WAVeform:IF:GAIN[:STATe]? [:SENSe]:WAVeform:IF:GAIN:AUTO[:STATe] ON OFF 1 0 [:SENSe]:WAVeform:IF:GAIN:AUTO[:STATe]?</pre>
Example	<pre>:WAV:IF:GAIN HIGH :WAV:IF:GAIN? :WAV:IF:GAIN:AUTO ON :WAV:IF:GAIN:AUTO?</pre>
Notes	<p>This only applies to the RF input and does not apply to baseband I/Q input</p> <p>Activates the auto rules for IF Gain</p>
Dependencies	<p>If you try to select AUTOorange via SCPI while Digital Bus Out is ON, an error message -224, "Illegal parameter value; "IF Gain Autorange not allowed when Digital Bus Out is on" is displayed</p> <p>If you try to select AUTOorange via the front panel while Digital Bus Out is ON, an error message -221 "Settings conflict; "IF Gain Autorange not allowed when Digital Bus Out is on" is displayed</p>
Couplings	<p>As with most parameters that have an AUTO state, AUTO COUPLE sets it to AUTOorange, which then selects LOW or HIGH depending on the IF Path. Setting any specific value (AUTOorange, LOW, HIGH, or OTHER) sets the AUTO state to false</p>
Preset	<pre>LOW ON</pre>
State Saved	<p>Saved in instrument state</p>
Range	<p>Autorange (Slower Follows Signals) Low (Best for Large Signals) High (Best Noise Level) Other (Explicit)</p> <pre>OFF ON</pre>

IF Gain Offset

Sets the **IF Gain Offset** for the 40 MHz, 140 MHz, 160 MHz IF Paths in 1 dB step from the minimum gain available to the maximum. Increasing the gain can increase

the amplitude of small signals, as long as you don't overdrive the hardware. Wideband gain should usually be adjusted after setting the input attenuation.

Internally, the **IF Gain** value will change based on the current configuration of the Hardware. You can choose to offset this value with this parameter. Hence the value specified is not an absolute value but relative to the current internal **IF Gain** setting.

For example:

- IF Gain Low + IF Gain Offset +4 dB = Total IF Gain of +4 dB (0 + 4 = 4)
- IF Gain High + IF Gain Offset +4 dB = Total IF Gain of +14 dB (10 + 4 = 14)
- IF Gain Low + IF Gain Offset -6 dB = Total IF Gain of -6 dB (0 - 6 = -6)
- IF Gain High + IF Gain Offset -6 dB = Total IF Gain of +6dB (10 - 6 = 4)

The available IF Gain depends on the IF Path and center frequency. The maximum IF Gain may not be achievable at all times depending on the configuration.

Remote Command	<code>[:SENSe]:WAVeform:IF:GAIN:OFFSet <rel_amp1></code> <code>[:SENSe]:WAVeform:IF:GAIN:OFFSet?</code>
Example	<code>:WAV:IF:GAIN:OFFS 2</code> Sets the IF Gain offset to 2
Couplings	This control is not available in EXM and UXM When " IF Gain " on page 2541 State is set to OTHer , the " Other IF Gain " on page 2543 value is used and the IF Gain Offset value is ignored
Preset	0
State Saved	Saved in instrument state
Min/Max	Depends upon hardware present

Other IF Gain

Explicitly specifies the IF gain value.

This parameter is only applicable when the "**IF Gain**" on page 2541 is set to **OTHer**. When **IF Gain** is set to **AUTOorange**, **LOW**, or **HIGH**, this value is ignored.

Remote Command	<code>[:SENSe]:WAVeform:IF:GAIN:LEVel <rel_amp1></code> <code>[:SENSe]:WAVeform:IF:GAIN:LEVel?</code>
Example	<code>:WAV:IF:GAIN:LEV -10</code> <code>:WAV:IF:GAIN:LEV?</code>
Preset	0
State Saved	Saved in instrument state
Min/Max	Depends upon hardware present

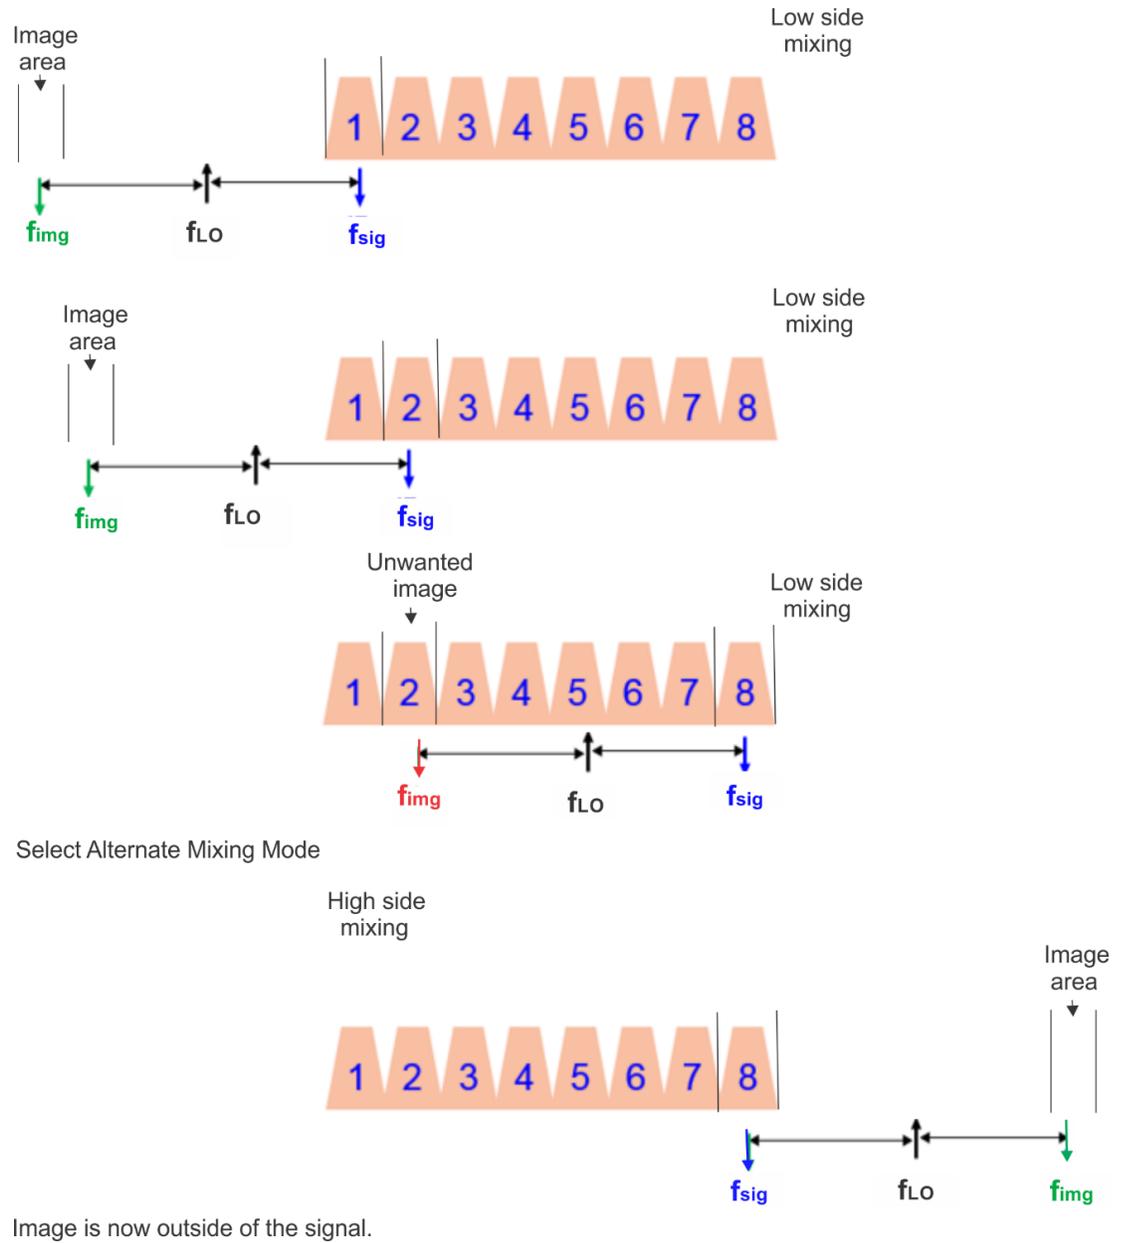

Mixing Mode

Mixing Mode enables you to alternate between mixing modes for the Local Oscillator (LO). The default setting is **NORMa1** LO mixing mode, which is determined by the instrument configuration to be either “high side” or “low side”. Typically, “high side” mixing mode is used for the **NORMa1** LO mixing mode. Selecting the **ALternate** mixing mode selects “low side” mixing when the **NORMa1** mixing mode is “high side” mixing, and selects “high side” mixing mode when the **NORMa1** mixing mode is “low side” mixing.

This function can be useful in eliminating images that may be seen from adjacent channels. Whenever you have signals that are twice the IF above your signal of interest, they will alias on top of your signal. To eliminate this issue, switch to **ALternate** side mixing and your measurement will be image free.

Example

When testing a 5G signal with all 8 channels ON, where each channel is 100 MHz wide, there may be cases where you see images from adjacent channels. To measure the highest frequency carrier, you will need to switch to alternate side mixing, to avoid the 8th carrier from aliasing on top of other carriers.

Remote Command	<code>[:SENSe]:WAVeform:LO:MIXMode NORMal ALTeRnate</code> <code>[:SENSe]:WAVeform:LO:MIXMode?</code>
Example	<code>:WAV:LO:MIXM NORM</code> <code>:WAV:LO:MIXM?</code>
Dependencies	This control is not available in N9000B This control is grayed-out when the RF Input is set to something other than RF (such as External

	Mixer). If you press the grayed-out control, a warning message “Feature only available with Signal Input RF” is shown If you try to set Mixing Mode via SCPI when disabled, a message -221, "Settings conflict; Feature only available with signal input RF" is returned
Preset	NORMa1
State Saved	Yes
Range	NORMa1 ALTErnate

Optimize EVM

This is an "immediate action" function to optimize IQ data capture settings for best EVM. It is used to set the combination of preamp, mechanical and electronic attenuation and IF gain value based on measured signal peak level. Its purpose is to get better EVM results by improving SNR and avoid ADC overload at the same time.

After this control is pressed, **Pre-Adjust for Min Clipping** is changed to **OFF** and **IF Gain Auto** is changed to Manual.

Remote Command	[:SENSe] :WAVeform :OPTimize :EVM
Example	:WAV :OPT :EVM

Mixing Mode State (Remote Command Only)

This query is available *only* in the Complex Spectrum, Streaming, and Waveform measurements.

Mixing Mode enables you to alternate between mixing modes for the Local Oscillator (LO). The default setting is **NORMa1** LO mixing mode, which is determined by the instrument configuration to be either “high side” or “low side”. The **Mixing Mode State** query returns “High” or “Low” to determine if the mixing is “high side” or “low side”. If **Mixing Mode** is toggled between **NORMa1** and **ALTErnate**, then Mixing Mode State also toggles between “High” and “Low”.

Remote Command	[:SENSe] :SPECTrum :LO :MIXMode :SIDE? [:SENSe] :WAVeform :LO :MIXMode :SIDE?
Example	:SPEC :LO :MIXM :SIDE? :WAV :LO :MIXM :SIDE?
Dependencies	Not available in N9000B
Couplings	When Mixing Mode is toggled between NORMa1 and ALTErnate , Mixing Mode State also toggles between High and Low
Range	High Low

IF Frequency (Remote Command Only)

This query is available *only* in the Complex Spectrum, Streaming, and Waveform measurements.

It returns the current IF Frequency used in the IF Path.

Remote Command	<code>[:SENSe] :SPEctrum :IF :FREQuency?</code> <code>[:SENSe] :WAVeform :IF :FREQuency?</code>
Example	<code>:SPEC :IF :FREQ?</code> <code>:WAV :IF :FREQ?</code>
Couplings	A change in Span , Digital IF BW or IF Path parameters can result in a change of the IF Frequency value

3.11.8.6 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, **Global Center Freq**) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global Settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Freq** will remain unchanged.

Adjusting the Center Freq of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the Center Freq of the current Mode is unchanged, but now the Center Freq of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset Center Freq of the current Mode.

This function is reset to **OFF** when "**Restore Defaults**" on page 2680 (in this tab) is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTRUMENT:COUPLE:FREQUENCY:CENTER ALL NONE :INSTRUMENT:COUPLE:FREQUENCY:CENTER?
Example	:INST:COUP:FREQ:CENT ALL :INST:COUP:FREQ:CENT?
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	:GLOBal:FREQUENCY:CENTER[:STATE] 1 0 ON OFF :GLOBal:FREQUENCY:CENTER[:STATE]?

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the Global EMC Std, so you can switch between any of these Modes and the EMC Std will remain unchanged.

Adjusting the EMC Std of any Mode that supports Global Settings, while Global EMC Std is **ON**, will modify the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode is unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, the Global EMC Std is preset to the preset EMC Std of the current Mode.

This function is reset to **OFF** when "**Restore Defaults**" on page 2680 (in this tab) is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTRUMENT:COUPLE:EMC:STANDARD ALL NONE :INSTRUMENT:COUPLE:EMC:STANDARD?
Example	:INST:COUP:EMC:STAN ALL :INST:COUP:EMC:STAN?
Dependencies	Only available if option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned **ON**, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function is reset to **OFF** when "**Restore Defaults**" on page 2680 (in this tab) is pressed, or when **System, Restore Defaults, All Modes** is pressed.

This parameter is available for SA, RTSA, WCDMA, LTEAFDD, and LTEATDD Modes.

Remote Command	<code>:INSTRument:COUPlE:FREQUency:BAND:EXTend 0 1 ON OFF</code> <code>:INSTRument:COUPlE:FREQUency:BAND:EXTend?</code>
Example	<code>:INST:COUP:FREQ:BAND:EXT 1</code> <code>:INST:COUP:FREQ:BAND:EXT?</code>
Dependencies	Only applies to UXA, PXA, MXA and EXA
Preset	Set to OFF by Global Settings > Restore Defaults and System > Restore Defaults > All Modes
Range	ON OFF

Restore Defaults

Resets all the functions in the **Global > Settings** menu to **OFF**. This also occurs when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:DEFault</code>
Example	<code>:INST:COUP:DEF</code>
Backwards Compatibility SCPI	<code>:GLOBal:DEFault</code>

3.11.8.7 Sample Period (Aperture) Setting (Remote Command Only)

Returns the time between samples (sample period or aperture).

Remote Command	<code>[:SENSe] :WAVeform:APERture?</code>
Example	<code>:WAV:APER?</code>
Notes	Query only
Couplings	Coupled to Sample Rate by the following equation Sample Period = 1/(Sample Rate)
Preset	1/(Sample Rate Default)
Min/Max	1/(Max Sample Rate)/1/(Min Sample Rate)

3.11.9 Sweep

Accesses controls that enable you configure and control the acquisition of data and the X-axis parameters of the instrument. These controls might include Sweep Time, Continuous/Single, Pause/Resume, X Scale, and number of Points.

3.11.9.1 Sweep/Control

Accesses controls that enable you to operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Restart

Restarts the current sweep, or measurement, or set of averaged/hold sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 2551

Remote Command	<code>:INITiate[:IMMEDIATE]</code> <code>:INITiate:REStart</code>
Example	<code>:INIT:IMM</code> <code>:INIT:REST</code>
Notes	<code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATUS:QUESTionable</code> register bit 9 (<code>INTegrity</code> sum) is cleared The <code>SWEEPING</code> bit is set The <code>MEASURING</code> bit is set
Backwards Compatibility	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the <code>:INIT:REST</code> command restart trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not

Notes	<p>restart Max Hold and Min Hold</p> <p>In X-Series, the Restart hardkey and the <code>:INIT:REST</code> command restart not only Trace Average, but MaxHold and MinHold traces as well</p> <p>For wireless comms modes in ESA and PSA, the Restart hardkey and the <code>:INIT:REST</code> command restart every measurement, which includes all traces and numeric results. There is no change to this operation</p>
-------	---

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support Pausing
Annotation	Only on control

Sweep/Measure

Allows you to toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 2554

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility	For Spectrum Analysis Mode in ESA and PSA, there is no Cont hardkey, instead there is a Sweep Single/Cont softkey. In these instruments, switching the Sweep Single/Cont softkey from Single to

Notes

Cont restarts averages (displayed average count reset to 1), but does not restart **Max Hold** and **Min Hold**

X-Series A-models have **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and **INIT:CONT ON**) switches to continuous measurement, but never restarts a measurement and never resets a sweep

X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

For Spectrum Analysis Mode in ESA and PSA, the **Single** hardkey and the **INITiate:IMM** switched from continuous measurement to single measurement and restarted sweeps and averages (displayed average count reset to 1), but did not restart **Max Hold** and **Min Hold**. In the X-Series, the **Restart** control and the **INITiate:IMM** command initiate a sweep/ measurement/ average sequence/hold sequence including **MaxHold** and **MinHold**

For Spectrum Analysis Mode in ESA and PSA, the **Single** hardkey restarted the sweep regardless of whether or not you were in an active sweep or sweep sequence. In the X-Series, **Restart** does this

More Information

Continuous Mode The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the **Average/Hold Num**, the count stops incrementing, but the instrument keeps sweeping

See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep

The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

Single Mode The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping

See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep

The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If it is already in continuous sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See the **"Restart" on page 2683** control description for details of `:INIT:IMMEDIATE`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the alignment finishes *before* the abort function is performed, so `:ABORT` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORT</code>
Example	<code>:ABOR</code>
Notes	<p>If <code>:INIT:CONT</code> is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met</p> <p>If <code>:INIT:CONT</code> is OFF, then <code>:INIT:IMM</code> is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met</p>
Dependencies	<p>For continuous measurement, <code>:ABORT</code> is equivalent to the Restart key</p> <p>Not all measurements support this command</p>
Status Bits/OPC dependencies	<p>The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The <code>STATUS:QUESTionable</code> register bit 9 (INTEGRITY sum) is cleared</p>

Since all the bits that feed into OPC are cleared by **:ABORT**, the Abort command will cause the ***OPC** query to return true

3.11.9.2 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

Ref Value

Sets the display X reference value.

Remote Command	<code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:RLEVel <time></code> <code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:RLEVel?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:X:RLEV 10 ms</code> <code>:DISP:WAV:VIEW:WIND:TRAC:X:RLEV?</code>
Notes	View 1 is the RF Envelope View View 2 is the I/Q Waveform View
Couplings	If X "Auto Scaling" on page 2557 is ON , this value is automatically determined by the measurement result. When you set a value manually, X Auto Scaling automatically changes to OFF
Preset	0.000 s
State Saved	Saved in instrument state
Min/Max	-1 s /10.0 s
Annotation	<value> s bottom left of graph

Scale/Div

Sets the display X scale/division value.

Remote Command	<code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:PDIVision <time></code> <code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:PDIVision?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:X:PDIV 500 us</code> <code>:DISP:WAV:VIEW:WIND:TRAC:X:PDIV?</code>
Notes	View 1 is the RF Envelope View View 2 is the I/Q Waveform View
Couplings	If X "Auto Scaling" on page 2557 is ON , this value is automatically determined by the measurement result. When you set a value manually, X Auto Scaling automatically changes to OFF
Preset	200.0 us
State Saved	Saved in instrument state

Min	1.00 ns
Max	320 s

Ref Position

Sets the reference position for the X axis to **LEFT**, **CENTER** or **RIGHT**.

Remote Command	<code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALE]:RPOsition LEFT CENTER RIGHT</code> <code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALE]:RPOsition?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:X:RPOS LEFT</code> <code>:DISP:WAV:VIEW:WIND:TRAC:X:RPOS?</code>
Preset	LEFT
State Saved	Yes Saved in instrument state
Range	LEFT CENTER RIGHT

Auto Scaling

Toggles the scale coupling function between **ON** and **OFF**.

Remote Command	<code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALE]:COUPle 0 1 OFF ON</code> <code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALE]:COUPle?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:X:COUP ON</code> <code>:DISP:WAV:VIEW:WIND:TRAC:X:COUP?</code>
Couplings	When Auto Scaling is ON and the Restart front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results When you set the value of either " Scale/Div " on page 2556 or " Ref Value " on page 2556 manually, Auto Scaling automatically changes to OFF
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

3.11.10 Trace

There are no Trace controls in this measurement.

3.12 Phase and Amplitude vs Time Measurement

This measurement performs narrow band long capture; phase and amplitude variation over the capture is computed.

The steps involved in the PAVT measurement include:

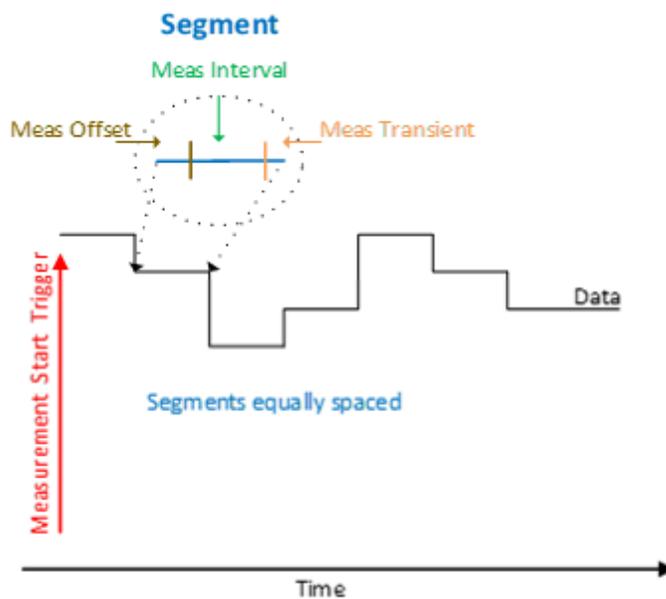

- 1 Instrument Setup You configure the measurement for Center Frequency, Triggering, and Amplitude. Adjust the Amplitude Reference level, Range, or Adjust Range for Min Clipping as appropriate for the transmitted signal. Once the amplitude settings are obtained, ensure that the transmitted signal remains within the dynamic range of the instrument for proper measurement to be performed
- 2 Determine Frequency Error Provide the Frequency Error, or perform a measurement of Frequency Error. The Frequency Error measurement is at narrow band with a specific sample rate. When the measurement is run, the transmitted signal must not change in frequency
- 3 Actual measurement This is a long capture of the transmitted signal as the phase and amplitude of the signal changes. The power and phase for the entire captured signal will be calculated from the measured data and Frequency Error

Based on the Phase and Power calculated, additional manipulation on the data occurs to reduce the result to the request number of segments and to make the results relative to the first segment.

The first segment is called the Relative Baseline; the absolute values of the first segment are stored into the Relative Baseline result and then normalized to obtain 0° phase and 0 dB reference.

Measurement Operation

The 1st segment (the Relative Baseline) is initiated when the Trigger conditions are met, and all following segments are computed immediately thereafter based on the Meas Offset, Meas Interval, and Meas Transient. The measurement time of each segment is linear progression (segments are equally spaced).

Phase and Amplitude vs Time Measurement Commands

The following commands and queries can be used to configure the measurement, then retrieve the measurement results:

```
:CONFigure:PAVTime
:CONFigure:PAVTime:NDEFault
:INITiate:PAVTime
:FETCh:PAVTime[n]?
:READ:PAVTime[n]?
:MEASure:PAVTime[n]?
```

Remote Command Results for Phase and Amplitude vs Time

The following table describes the results returned by the FETCh, MEASure, and READ queries listed above, according to the index value **n**. All the return values are floating point numbers in scientific notation, they are listed in the table as integers or simple real values for readability. If no result is available, **NaN** (9.91E+37) is returned.

n	Results Returned
0	Returns the number of measured segments (points)
not specified or 1	Returns scalar results for the segments measured in quadruple format, Phase, Amplitude, Time and Delta Frequency Error

n	Results Returned
	For example if " Segments " on page 2626 = 5, then the return result would look like: 0, 0, 0, -168E-03, -9.63E-03, 0.9212E-03, 0.999E-03, 161.455E-03, 70.976E-03, -0.612E-03, 2.000E-03, -87.325E-03, 59.676E-03, -0.347E-03, 2.999E-03, 301.646E-03, 104.21E-03, -0.318E-03, 4.000E-03, 358.402E-03
2	Returns scalar Phase results for the segments measured, equivalent to the Phase values from the n = 1 query For example if Segments = 5, then the return result would look like: 0,10,-10,20,-30
3	Returns scalar Amplitude results for the segments measured, equivalent to the Amplitude values from the n = 1 query For example if Segments = 5, then the return result would look like: 0,-.5,-1.2,1.2,2.5
4	Returns scalar Time results for the segments measured, equivalent to the Time values from the n = 1 query For example if Segments = 5, then the return result would look like: 0,10,20,30,40
5	Returns scalar Frequency Error results for the segments measured For example if Segments = 5, then the return result would look like: 0,100000,120000,-80000,90000
6	Returns the Relative Baseline results <ol style="list-style-type: none">1. Phase2. Amplitude For example: 125, -15.25

3.12.1 Views

The PAVT measurement has one view: "[Normal](#)" on page 2610.

This is a multiple-window View. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

3.12.1.1 Normal

Windows: "[Graph](#)" on page 2561, "[Results](#)" on page 2561

The PAVT measurement provides tabular result and graphical display.

3.12.2 Windows

This section describes the windows that are available in Phase and Amplitude vs Time measurements.

3.12.2.1 Graph

Corresponding Trace

Yellow: Phase vs Time

Light Blue: Amplitude vs Time

3.12.2.2 Results

Displays the Frequency Error, the Relative Baseline values, and the list of textual results of the Phase and Amplitude vs Time measurement.

Results window

Name	Corresponding Results	Example
Frequency Error [Hz]	Frequency error supplied by user, or measured by invocation of Measure Frequency Error immediate action	-125 kHz
Relative Baseline [°]	Phase of the 1 st segment before normalization	45°
Relative Baseline [dBm]	Amplitude of the 1 st segment before normalization	-15.00 dBm
Phase [°]	The phase of the particular segment relative to the 1 st segment	-45°
Amplitude [dB]	The amplitude of the particular segment relative to the 1 st segment	-1.99 dB
Time [ms]	The start time of the Meas Interval for the particular segment relative to the 1 st segment. When Meas Type = Normal the Time is equally spaced over the Total Meas Time	10 ms
Delta Freq Error [Hz]	Additional Frequency error of each segment	-1.00 MHz

3.12.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.12.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Scale

Selects the active scale for parameter adjustments of the menu.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe] AMPLitude PHASe</code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y AMPL</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y?</code>
Preset	PHASe
State Saved	Saved in instrument state
Range	Amplitude Phase

Ref Value

The reference line is at the top, center, or bottom of the graticule, depending on the value of "[Ref Position](#)" on page 2564.

Amplitude Scale

Sets the value for the reference position for the Amplitude Scale.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:AMPLitude:RLEVel</code> <code><rel_ampl></code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:AMPLitude:RLEVel?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:RLEV -10 dB</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:RLEV?</code>
Preset	Automatically calculated
State Saved	Saved in instrument state
Min/Max	-100/+100 dB
Annotation	Ref <value> top of graph

Phase Scale

Sets the value for the reference position for the Phase Scale. The reference line is at the top, center, or bottom of the graticule, depending on the value of **Ref Position**.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PHASe:RLEVel <real></code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PHASe:RLEVel?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:PHAS:RLEV 90</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y:PHAS:RLEV?</code>
Preset	Automatically calculated
State Saved	Saved in instrument state
Min/Max	-1000/+1000
Annotation	Ref <value> / top of graph

Scale/Div

Sets the units per division in the graph window.

Amplitude Scale

Sets the units per division of the amplitude vertical scale in the graph window.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:AMPLitude:PDIVision <rel_ampl></code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:AMPLitude:PDIVision?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:PDIV 5</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:PDIV?</code>
Preset	Automatically calculated
State Saved	Saved in instrument state
Range	0.10 dB to 20.00 dB
Min	0.10 dB
Max	20.00 dB
Annotation	<value> dB/ left upper of graph

Phase Scale

Sets the units per division of the phase vertical scale in the graph window.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PHASe:PDIVision <real></code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PHASe:PDIVision?</code>
----------------	--

Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:PHAS:PDIV 5</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y:PHAS:PDIV?</code>
Preset	Automatically calculated
State Saved	Saved in instrument state
Range	1 to 100
Min	1
Max	100
Annotation	<value> / left upper of graph

Ref Position

Positions the reference level at the top, center or bottom of the Y Scale display.

Amplitude Scale

Positions the Amplitude scale reference level at the top, center or bottom of the Y Scale display. Changing the reference position does not change the value of "Ref Value" on page 2562.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:AMPLitude:RPOStion TOP CENTer BOTTom</code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:AMPLitude:RPOStion?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:RPOS TOP</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:RPOS?</code>
Preset	<code>CENTer</code>
State Saved	Saved in instrument state
Range	Top Center Bottom
Annotation	> and < are displayed both side of graph to indicate Reference Position

Phase Scale

Positions the Phase Scale reference level at the top, center or bottom of the Y Scale display. Changing the reference position does not change the value of "Ref Value" on page 2562.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:PHASe:RPOStion TOP CENTer BOTTom</code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:PHASe:RPOStion?</code>

Preset	CENTer
State Saved	Saved in instrument state
Range	Top Center Bottom
Annotation	> and < are displayed both side of graph to indicate Reference Position

3.12.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations "](#) on page 2565
- See ["Single-Attenuator Configuration "](#) on page 2566

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

This tab is only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does not appear in:

- VXT models SP900B/10A/11A

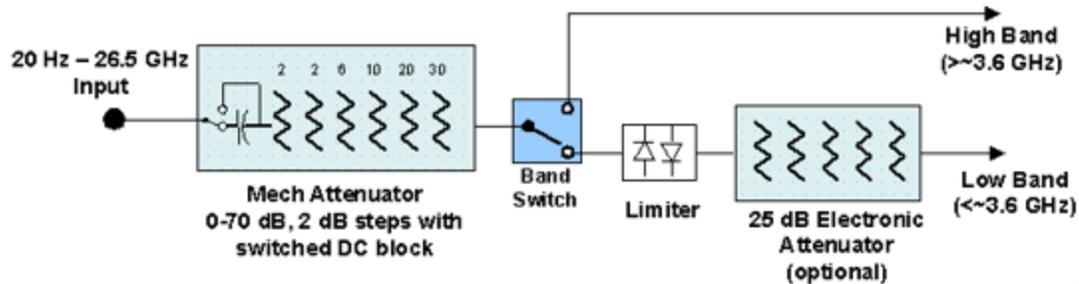

This tab also does not appear in UXM. In UXM all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies	In measurements that support the I/Q inputs, this tab is unavailable when I/Q is the selected input, and is replaced by the Range tab in that case
--------------	---

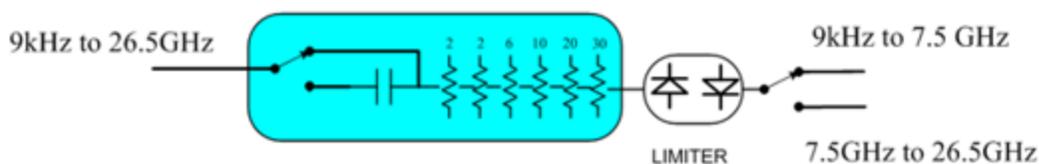

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

3 5G NR Mode
 3.12 Phase and Amplitude vs Time Measurement

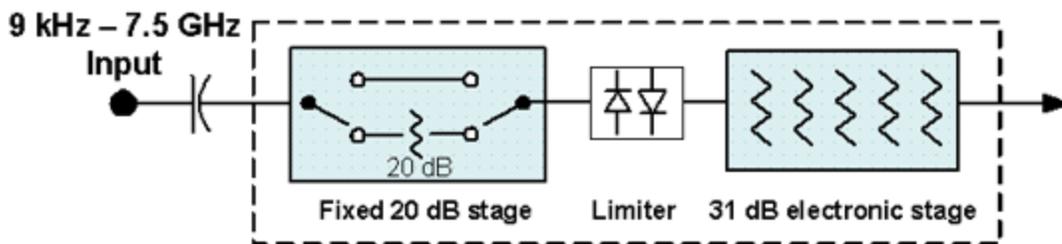

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

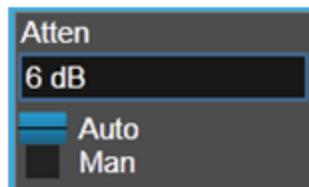

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in SP900S, when the RF input is selected and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator at the beginning of the RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, and RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 2568 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF , and the Input Port is RF Input 2 , and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows: <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten In the Amplitude , " Y Scale " on page 2562 menu, and the Atten Meas Bar dropdown menu panel, a

summary is displayed as follows:

“Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten

“Total Atten above 50 GHz” followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

This control is labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

This control lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "[Attenuator Configurations and Auto/Man](#)" on page 2570

Remote Command	<pre>[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl> [:SENSe]:POWer[:RF]:ATTenuation? [:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1 [:SENSe]:POWer[:RF]:ATTenuation:AUTO?</pre>
----------------	--

Example	<pre>:POW:ATT 20</pre>
---------	------------------------

Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB

Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation)

In either case, if the attenuator was in Auto, it is set to Manual

```
:POW:ATT:AUTO ON
```

Turn Auto Mech Atten **ON**

Dependencies	Some measurements do not support the Auto setting of " Mech Atten " on page 2568. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available
--------------	---

In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "[Elec Atten](#)" on page 2571

See "[Attenuator Configurations and Auto/Man](#)" on page 2570 for more information on the Auto/Man

	<p>functionality</p> <p>:POW:ATT:AUTO is only available in measurements that support Mech Atten Auto, such as Swept SA</p>
Couplings	<p>If the RF Input Port is the RF Input:</p> <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In the SP900S, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 2568 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5GHz. So, when the frequency is changed from below 7.5GHz to above 7.5GHz, the attenuation setting will be changed to a multiple of 10dB which will be no smaller than the previous setting. For example, 4dB attenuation will be changed to 10dB</p>
Preset	<p>The preset for Mech Attenuation is "Auto"</p> <p>The Auto value of attenuation is 10 dB</p> <p>ON</p>
State Saved	Saved in instrument state
Min	<p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</p>
Max	<p>CXA Option 503 or 507: 50 dB</p> <p>EXA: 60 dB</p> <p>All other models: 70 dB</p> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as</p> <p>Atten: <total> dB (e<elec>)</p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p>

Dual-Attenuator configuration:

Atten: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB

Single-Attenuator configuration:

A: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)

When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described in ["Y Scale" on page 2562](#), there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using ["Mech Atten" on page 2568](#) (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation. See ["Elec Atten" on page 2571](#) for more on “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. This control does not appear in Single-Attenuator configurations, as the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an Enable/Disable toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the “Enable” position.

For more details about the Electronic Attenuator, see ["More Information " on page 2572](#)

Remote Command	<pre>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1> [:SENSe]:POWer[:RF]:EATTenuation? [:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1 [:SENSe]:POWer[:RF]:EATTenuation:STATe?</pre>
Example	<pre>:POW:EATT 10 :POW:EATT? :POW:EATT:STAT ON :POW:EATT:STAT?</pre>
Notes	Electronic Attenuation's specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	<p>This control only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single-Attenuator configuration, as in the Single-Attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments and set a “soft” attenuation as described in . The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Atten control or :POW:ATT and affects the total attenuation displayed on the Atten control and the Meas Bar</p> <p>The electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz 0-3GHz, depending on the model). If the low band ranges from 0-3.6GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable will be sent</p> <p>If both of the above are true, pressing the control will generate error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and the Internal Preamp is unavailable</p>

If the LNA is on, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed-out. This coupling works in the following modes/measurements:

- Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes
- Transmit On|Off Power measurement in 5G NR Mode
- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 2572
Preset	0 dB OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "[Using the Electronic Attenuator: Pros and Cons](#)" on page 2573 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "[Attenuator Configurations and Auto/Man](#)" on page 2570

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the

odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under ["Pre-Adjust for Min Clipping" on page 2575](#).

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode

Restart Meas on Adjust Atten

Toggles the force restart switch for the ["Adjust Atten for Min Clipping" on page 2574](#) function.

When **ON**, pressing **Adjust Atten for Min Clipping**, or sending `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` restarts the measurement and then executes the function.

When **OFF**, pressing the control or sending the command neither restarts the measurement nor executes the function until you restart or continue averaging. In this case, pressing the control generates the following advisory message:

"Adjust Atten is deferred until "Restart" or "Continue Averaging" is executed"

This message is *not* generated if the command is sent.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:REStart OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:REStart?</code>
Example	<code>:POW:RANG:OPT:REST OFF</code> <code>:POW:RANG:OPT:REST?</code>
Dependencies	This parameter is available only in the measurements that support continuous averaging in 5G NR
Preset	ON
State Saved	Saved

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	COMBined
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 2574 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 2576

Selection	Example	Note
Off	<code>:POW:RANGe:OPT:ATT</code>	This is the default setting

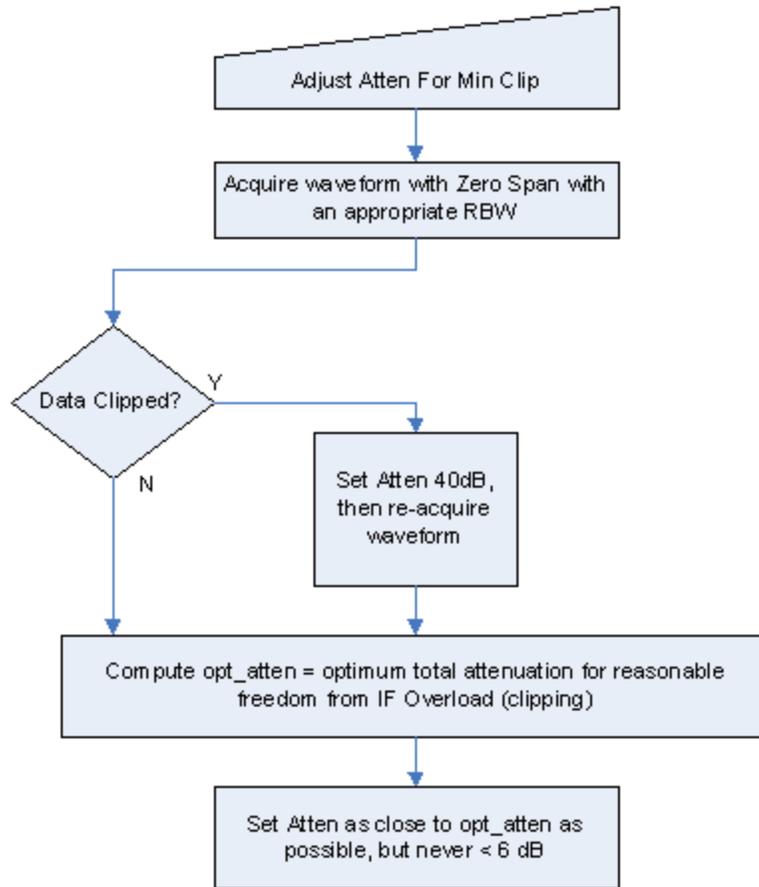

3 5G NR Mode
3.12 Phase and Amplitude vs Time Measurement

Selection	Example	Note
	OFF	
Elec Atten Only	:POW:RANG:OPT:ATT ELEC	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Mech + Elec Atten	:POW:RANG:OPT:ATT COMB	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging
Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?	
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?	
Notes	<p>The parameter option ELECTrical sets this function to ON in Single-Attenuator models</p> <p>The parameter option COMBined is mapped to ELECTrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query</p> <p>For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined</p>	
Dependencies	<p>This control only appears in Dual-Attenuator models with an Electronic Attenuator installed</p> <p>In instruments with Dual-Attenuator model, when "Elec Atten" on page 2571 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 2575 is grayed-out</p> <p>This control does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements</p> <p>For the Waveform measurement, this control is available only in 5G NR Mode</p>	
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC	
State Saved	Saved in instrument state	
Range	Dual-Attenuator models: Off Elec Atten Only Mech + Elec Atten Single-Attenuator models: Off On	
Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF	
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?	

Adjustment Algorithm

The algorithms for the adjustment are documented below:

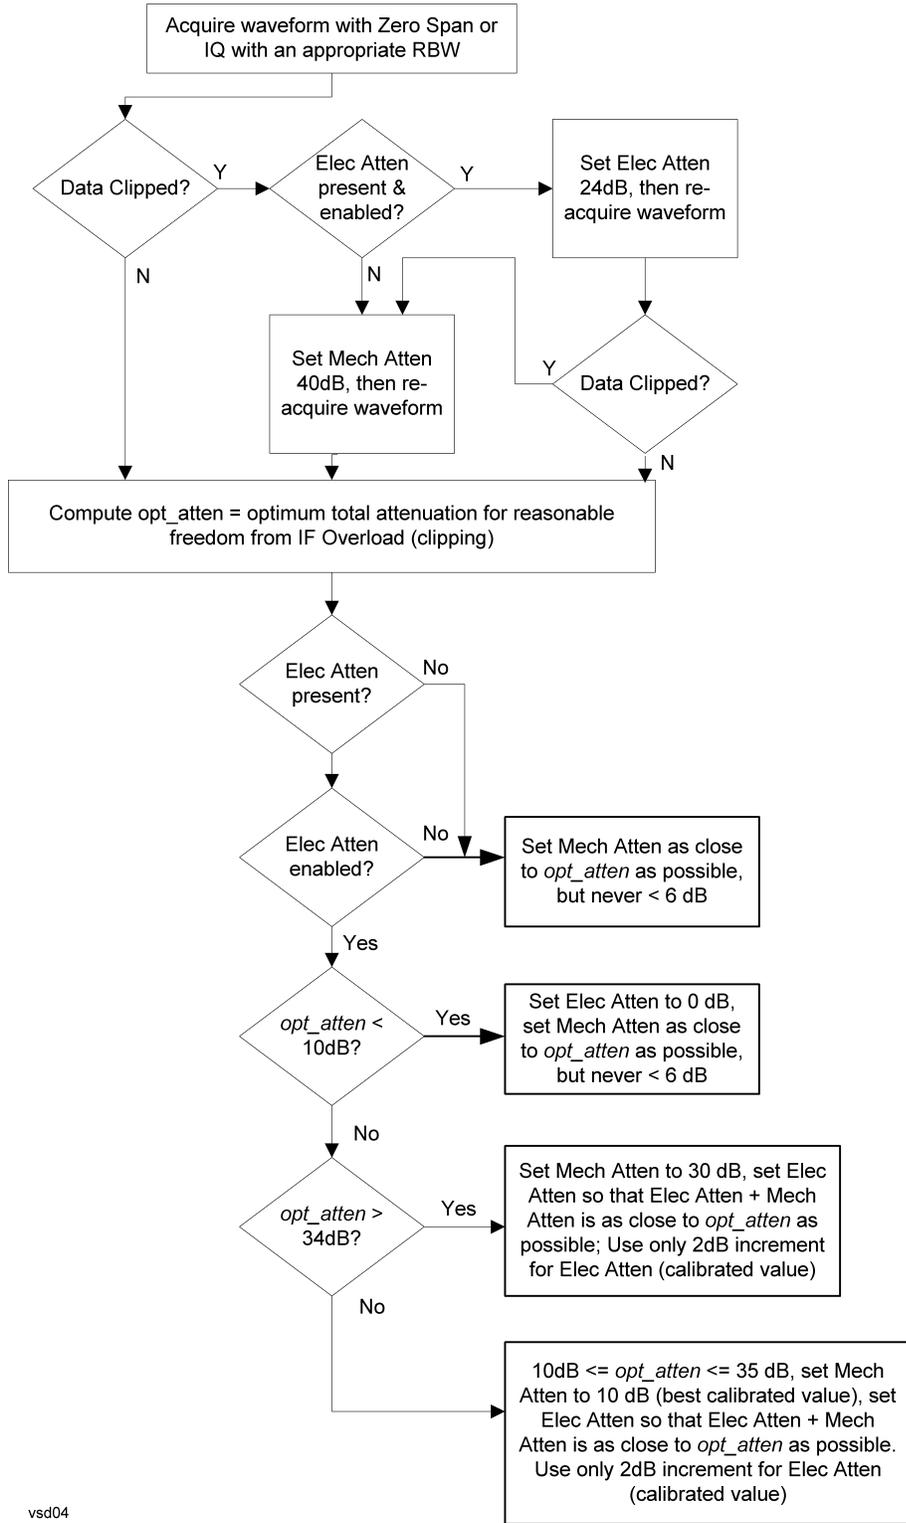

Single-Attenuator Models

Dual-Attenuator models

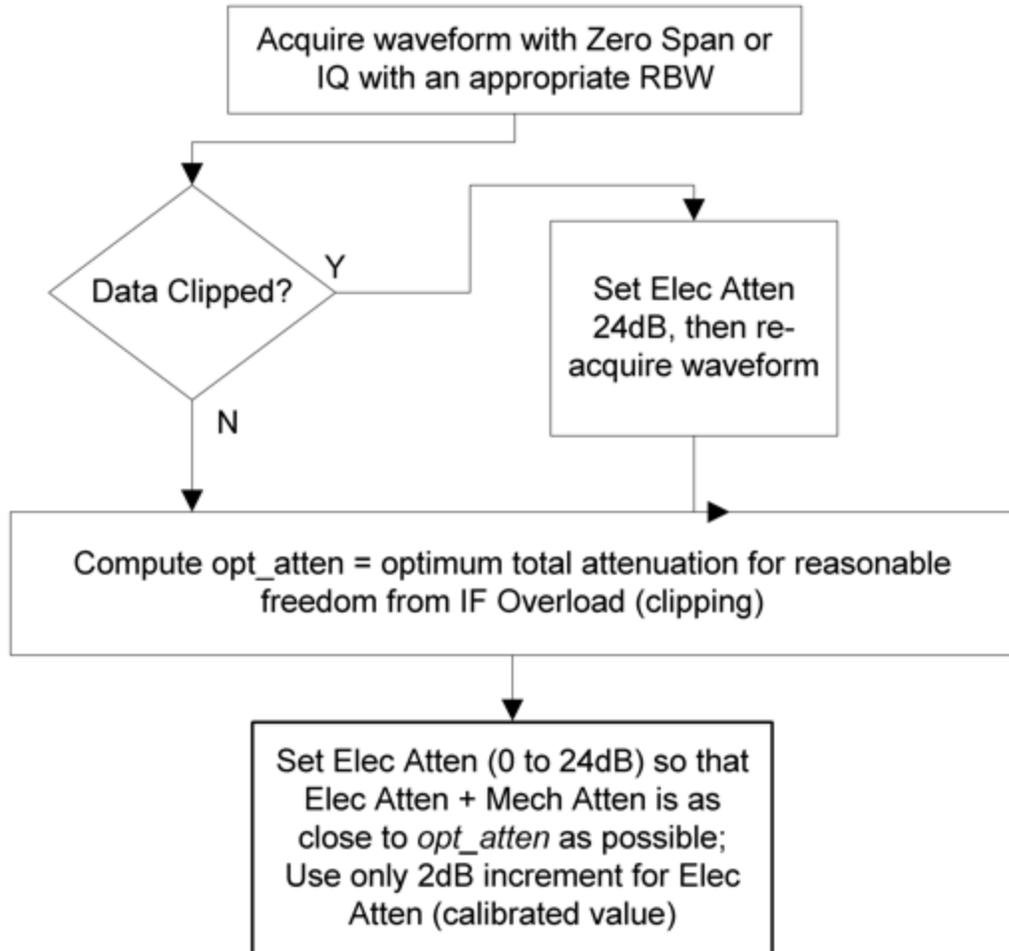

"Adjust Atten for Min Clipping" on page 2574 or "Pre-Adjust for Min Clipping" on page 2575 selection is Mech + Elec Atten:

3 5G NR Mode
 3.12 Phase and Amplitude vs Time Measurement

"Pre-Adjust for Min Clipping" on page 2575 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

This control is labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the step size of the mechanical attenuator.

Remote Command `[[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB
[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`

Example `:POW:ATT:STEP 2`

:POW:ATT:STEP?	
Notes	This feature has a toggle choice from the front panel, but it takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "[Max Mixer Lvl Rules](#)" on page 2580.

Remote Command	<code>[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real></code> <code>[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?</code>
Example	<code>:POW:MIX:RANG -15 dBm</code> <code>:POW:MIX:RANG?</code>
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Allows you to optimize the Max Mixer Level setting for certain kinds of measurements.

- **NORMa1** – The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the **Reference Level** is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression will be negligible
- **TOI** – Allows a range of settings of the "**Max Mixer Level**" on page 2580, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size
- **COMPression** – Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies. Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMa1	Normal – balance TOI, noise, and compression	–10	–50	0
TOI	TOI-limited dynamic range	–25	–50	–10
COMPression	Compression-limited dynamic range	–3	–10	+30

Remote Command	<code>[:SENSe] :POWer [:RF] :MIXer :RULEs NORMa1 TOI COMPression</code> <code>[:SENSe] :POWer [:RF] :MIXer :RULEs?</code>
Example	<code>:POW:MIX:RULE:COMP</code>
Dependencies	Only appears in Swept SA and RTSA
Preset	NORM

3.12.3.3 Range (Baseband Input models)

This tab is only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. It replaces the Attenuation tab in that case.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs"

State Saved No

Range Auto/Man

The Auto setting for Range causes the range to be set based on the Y Scale settings. When Range is "Auto", the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If Auto is not supported in the current measurement, this control is grayed-out displaying "Man", and **MAN** is returned to a SCPI query, but this does *not* change the Auto/Man setting for Range. When you switch to a measurement that supports Auto, it goes back to Auto if it was previously in Auto mode.

Remote Command `[:SENSe] :VOLTage :IQ :RANGe :AUTO OFF | ON | 0 | 1`
`[:SENSe] :VOLTage :IQ :RANGe :AUTO?`

Example Put the I Range and Q Range in manual
`:VOLT :IQ :RANG :AUTO OFF`
`:VOLT :IQ :RANG :AUTO?`

Dependencies If Auto is not supported, sending the SCPI command generates an error

Couplings When in Auto, both I Range and Q Range are set to the same value, computed as follows:
Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: $Y_{Max} = \max(\text{abs}(\text{top}), \text{abs}(\text{bottom}))$

	The I Range and Q Range are then set to Y_{Max}
Preset	ON
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#" This is an alternate form of the command to match the POWer form of the I Range and Q Range SCPI.
Remote Command	<code>[:SENSE]:POWer:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSE]:POWer:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:POW:IQ:RANG:AUTO OFF</code> <code>:POW:IQ:RANG:AUTO?</code>
Notes	<code>:POW:IQ:RANG:AUTO</code> is an alternate form of <code>:VOLT:IQ:RANG:AUTO</code> , to maintain consistency with I Range and Q Range, which support both the POWer and VOLTage forms of the command
Preset	ON
Range	Auto Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	<code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak <code>:VOLT:IQ:RANG 0.5 V</code> <code>:VOLT:IQ:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When " Q Same as I " on page 2586 is On, the I Range value will be copied to " Q Range " on page 2584 Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#"

The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples:

"Rng: 1 V Peak" the I Range is 1 V Peak

"Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote Command	<code>[:SENSe] :POWer :IQ [:I] :RANGe [:UPPer] <amp;lt;1></code> <code>[:SENSe] :POWer :IQ [:I] :RANGe [:UPPer] ?</code>
Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω , and to 1.0 V Peak when Reference Z is 75 Ω <code>:POW:IQ:RANG 4 dBm</code> <code>:POW:IQ:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω : 10, 4, -2, -8 75 Ω : 8.2, 2.2, -3.8, -9.8 600 Ω : -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "**I Range**" on page 2583 determines both I and Q channel range settings.

Remote Command	<code>[:SENSe] :VOLTage :IQ :Q :RANGe [:UPPer] <voltage></code> <code>[:SENSe] :VOLTage :IQ :Q :RANGe [:UPPer] ?</code>
Example	Set the Q Range to 0.5 V Peak: <code>:VOLT:IQ:Q:RANG 0.5 V</code> <code>:VOLT:IQ:Q:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, " I Range " on page 2583

	determines both I and Q channel range settings
Couplings	When "Q Same as I" on page 2586 is On, the "I Range" on page 2583 value is copied to Q Range and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSe] :POWer :IQ :Q :RANGe [:UPPer] < amp1 ></code> <code>[:SENSe] :POWer :IQ :Q :RANGe [:UPPer] ?</code>
Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω: <code>:POW:IQ:Q:RANG 4 dBm</code> <code>:POW:IQ:Q:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form of the command The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	<code>[:SENSe] :VOLTage POWer : IQ : MIRRored OFF ON 0 1</code> <code>[:SENSe] :VOLTage POWer : IQ : MIRRored ?</code>
Example	Turn off the mirroring of I Range to Q Range <code>:VOLT : IQ : MIRR OFF</code> <code>:POW : IQ : MIRR OFF</code>
Couplings	When ON , the "I Range" on page 2583 value is mirrored (copied) to the "Q Range" on page 2584
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

3.12.3.4 Range (Non-attenuator models)

This tab is only available for Keysight's modular signal analyzers and certain other Keysight products. Examples include:

- VXT

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe] : POWer [: RF] : RANGe <real></code> <code>[:SENSe] : POWer [: RF] : RANGe ?</code>
Example	<code>:POW : RANG 10 dBm</code> <code>:POW : RANG ?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency

	The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements

Restart Meas on Adjust Range

This control is the same as ["Restart Meas on Adjust Atten" on page 2574](#) under ["Attenuation" on page 2565](#).

Pre-Adjust for Min Clipping

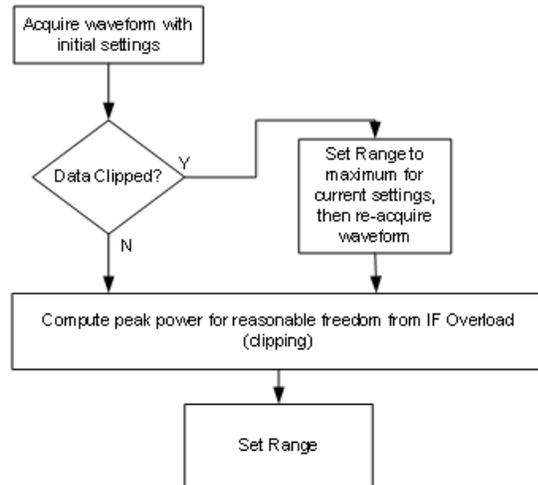

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTRICAL COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTRICAL , COMBined , and ON) are honored and all are mapped to ELECTRICAL , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping

State Saved Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 2586 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Applications (Modes) show the current value of Peak-to-Average ratio on the control. However, some applications do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGE:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGE:PARatio?</code>
Example	<code>:POW:RANG:PAR 12 dB</code>
Notes	In some Applications (Modes) this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	Does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models SP900B/11A: 0
State Saved	0 Saved in instrument state
Min	0 dB

Max	20 dB VXT Models SP900B/11A: 50 dB
-----	---------------------------------------

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 2588. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe] :POWer [:RF] :RANGe :MIXer :OFFSet <real></code> <code>[:SENSe] :POWer [:RF] :RANGe :MIXer :OFFSet ?</code>
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models SP900B/11A: -34
Max	0 dB

3.12.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, this tab only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Models M9420/21A. It also does not appear in UXM.

This tab *does* appear in VXT Models SP900B/11A because the Software Preselection control is in this tab, and VXT Models SP900B/11A implement a version of Software Preselection.

Presel Center

Pressing this control adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but

3 5G NR Mode
3.12 Phase and Amplitude vs Time Measurement

outside the frequency range between Start Freq and Stop Freq, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "[Preselector Adjust](#)" on page 2591 will change to reflect the new preselector tuning.

A number of considerations should be observed to ensure proper operation. See "[Proper Preselector Operation](#)" on page 2590.

Remote Command	<code>[:SENSe] : POWer [: RF] : PCENter</code>
Example	<code>: POW : PCEN</code>
Notes	Note that the rules outlined above under the control description apply for the remote command as well as the key. The result of the command is dependent on marker position, etc. Any message shown by the control press is also shown in response to the remote command
Dependencies	Does not appear in CXA-m Does not appear in VXT Models SP900B/11A Grayed-out if the microwave preselector is off if the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken <ul style="list-style-type: none"> - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blank in models that do not include a preselector, such as option 503. If the remote command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering reads out on the " Preselector Adjust " on page 2591 control
Status Bits/OPC dependencies	When centering the preselector, <code>*OPC</code> does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>: READ</code> or <code>: MEASure</code> queries The Measuring bit remains set while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering will be attempted, and an advisory message generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering will be attempted in that range and a message will be generated

Preselector Adjust

Allows you to manually adjust the preselector filter frequency to optimize its response to the signal of interest. This function is only available when "**Presel Center**" on page 2589 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe] :POWer [:RF] :PADJust <freq></code> <code>[:SENSe] :POWer [:RF] :PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control reads out to 0.1 MHz resolution
Dependencies	<ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models SP900B/11A - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The Preselector Adjust value set by " Presel Center " on page 2589, or by manually adjusting

Preselector Adjust	
Not saved in instrument state, and does not survive a Preset or power cycle	
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	<code>[:SENSe] :POWer [:RF] :MW :PADJust</code> <code>[:SENSe] :POWer [:RF] :MMW :PADJust</code>
Notes	The command has no effect, and the query always returns <code>MWAVe</code>
Backwards Compatibility SCPI	<code>[:SENSe] :POWer [:RF] :PADJust :PRESelector MWAVe MMWave EXTERNAL</code> <code>[:SENSe] :POWer [:RF] :PADJust :PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	<code>:POW:GAIN OFF</code>	
Low Band	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code>	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code>	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency** for Low Band, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as SP900S& SP900P), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, **N/A** is displayed in the square brackets for Low Band.

Remote Command	<pre>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL [:SENSe]:POWer[:RF]:GAIN:BAND? [:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1 [:SENSe]:POWer[:RF]:GAIN[:STATe]?</pre>
Example	<pre>:POW:GAIN:BAND LOW :POW:GAIN:BAND? :POW:GAIN OFF :POW:GAIN?</pre>
Dependencies	<p>Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown</p> <p>Does not appear in VXT Models SP900B/11A/15A/16A</p> <p>If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code>, and an "Option not installed" message is generated</p> <p>Not available when the electronic/soft attenuator is enabled</p>
Preset	<pre>LOW OFF</pre>
State Saved	Saved in instrument state
Annotation	<p>When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz"</p> <p>When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)</p>

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to **"Internal Preamp"** on page 2592. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, **LNA** can be turned on *together* with **"Internal Preamp"** on page 2592, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see **"More Information"** on page 2594

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models SP900B/16A Does not appear in VXT models SP900B/10A/11A May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
μW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
μW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μ W Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μ W Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μ W Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μ W Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	<code>:POW:MW:PATH STD</code>	Normal setting for most measurements. μ W Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	<code>:POW:MW:PATH LNP</code>	See " Low Noise Path Enable " on page 2599
μ W Preselector Bypass	<code>:POW:MW:PATH MPB</code>	See " μW Preselector Bypass " on page 2601
Full Bypass Enable	<code>:POW:MW:PATH FULL</code>	See " Full Bypass Enable " on page 2602

Remote Command `[:SENSe] :POWer [:RF] :MW:PATH STD | LNPath | MPBypass | FULL`
`[:SENSe] :POWer [:RF] :MW:PATH?`

Example `:POW:MW:PATH LNP`
 Enables the Low Noise path

: POW: MW: PATH?

Notes If "**Presel Center**" on page 2589 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **μW Path Control**

The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable**. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled

Alignment switching ignores the settings in this menu, and restores them when finished

Dependencies Does not appear in CXA-m, VXT Models SP900B/11A, nor in BBIQ and External Mixing

- The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed
- The **μW Preselector Bypass** selection does not appear unless Option MPB is present and licensed
- The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP

In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated

Low Noise Path Enable and **Full Bypass Enable** are grayed-out if the current measurement does not support them

Low Noise Path Enable and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"

Preset	Mode	Value
	IQ Analyzer	MPB option present and licensed: MPB
	Pulse	MPB option not present and licensed: STD
	Avionics	
	All other Modes	STD
	-	

State Saved Save in instrument state

Range Standard Path | Low Noise Path Enable | μW Presel Bypass | Full Bypass Enable

Annotation In the Meas Bar, if the Standard path is chosen, it says:
 μW Path: Standard
 If Low Noise Path is enabled but the LNP switch is not thrown, it shows:
 μW Path: LNP,Off
 If the Low Noise Path is enabled and the LNP switch IS thrown, it shows:
 μW Path: LNP,On

If the preselector is bypassed, it says:

μW Path: Bypass

If Full Bypass Enable is selected but the LNP switch is not thrown, it shows:

μW Path: FByp,Off

If Full Bypass Enable is selected and the LNP switch IS thrown, it shows:

μW Path: FByp,On

μW Path Control Auto [Mode: VMA, WLAN, NR5G, CQM]

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **μW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When μW Path Control is in Auto
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Preset	<code>ON</code>
Range	<code>ON OFF</code>

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

3 5G NR Mode

3.12 Phase and Amplitude vs Time Measurement

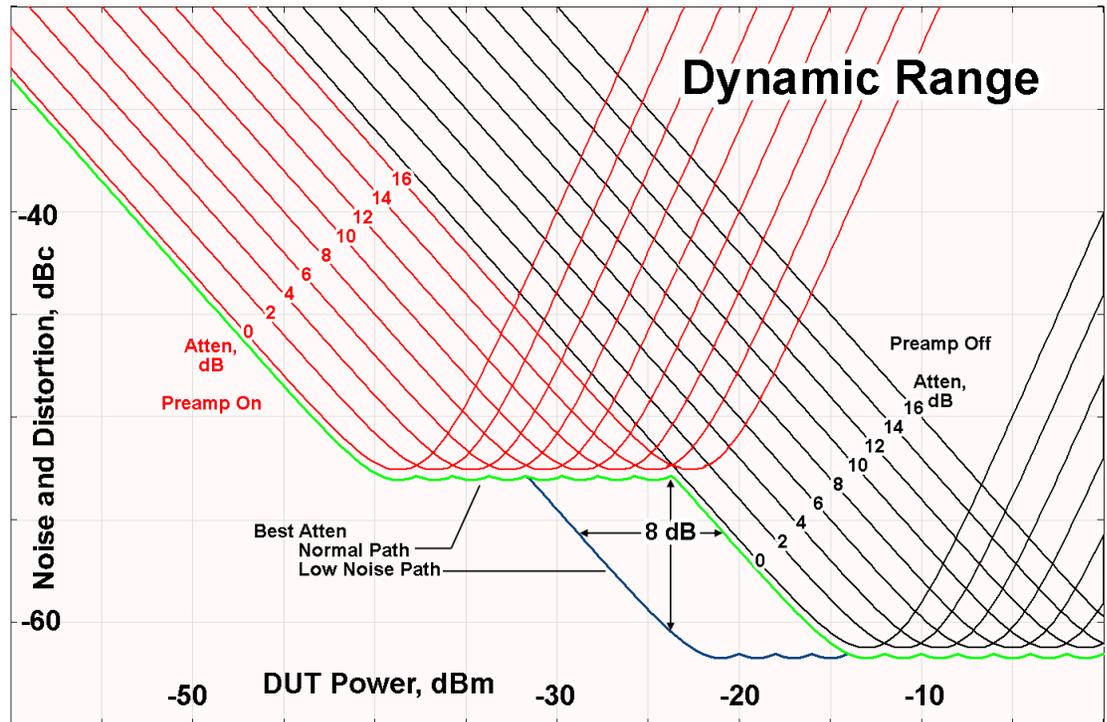

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around -30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage

when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
 - the start frequency is above 3.5 GHz and
 - the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 2562 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Microwave Preselector Bypass Backwards Compatibility

Example	<code>:POW:MW:PRES OFF</code> Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSE] :POWer [:RF] :MW:PRESelector [:STATe] ON OFF 0 1</code> <code>[:SENSE] :POWer [:RF] :MW:PRESelector [:STATe] ?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See "[μW Path Control](#)" on page 2594.

When this function is **ON**, and "[μW Path Control](#)" on page 2594 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, wherein both the Preamp and the Microwave Preselector are bypassed. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 2562 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Dependencies	Only appears if Option FBP is installed, and in the following measurements <ul style="list-style-type: none"> - 5GNR Modulation Analysis and IQ Waveform - WLAN IQ Waveform - Channel Quality Group Delay
Preset	OFF
State Saved	Saved in instrument state

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

SP900S

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The

specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In SP900S, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in SP900S, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

SP900S+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For SP900S+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for SP900S+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models SP900B/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models SP900B/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPResel:STAT?</code>						
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>						
Dependencies	Only appears in SP900S, SP900S+V2050A, and VXT models SP900B/11A. Does not appear in all measurements						
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state						
Preset	<table border="1"> <tr> <td>SP900S</td> <td>OFF</td> </tr> <tr> <td>SP900S+V3050A</td> <td>ON</td> </tr> <tr> <td>SP900B/11A</td> <td>ON</td> </tr> </table>	SP900S	OFF	SP900S+V3050A	ON	SP900B/11A	ON
SP900S	OFF						
SP900S+V3050A	ON						
SP900B/11A	ON						
State Saved	Saved in instrument state						

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in SP900Sand SP900S+V3050A. Only appears in measurements that use the Swept

	method	
	When " Software Preselection " on page 2604 is disabled, this control is grayed-out. The grayout message is "Unavailable unless SW Presel enabled"	
Preset	SP900S	ADVanced
	SP900S+V3050A	NORMa1
State Saved	Saved in instrument state	

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe] :POWer [:RF] :SWPreSel :BW NORMa1 NARRow</code> <code>[:SENSe] :POWer [:RF] :SWPreSel :BW?</code>	
Example	<code>:POW:SWPR:BW NARR</code>	
Dependencies	Only appears in SP900S and SP900S+V3050A. Only appears in measurements that use the Swept method When " Software Preselection " on page 2604 is disabled, this control is grayed-out. The grayout message is "Unavailable unless SW Presel enabled" For SP900S+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled	
Preset	SP900S	NORMa1
	SP900S+V3050A	NARRow
State Saved	Saved in instrument state	

High Freq Prefilter

Lets you set the state of Prefilter for Center Frequencies above 1310 MHz.

In VXT Models SP900B/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	For example, to enable High Freq Prefilter in IQ Analyzer Mode: For the Complex Spectrum Measurement: <code>:SPEC:PFIL ON</code> For the IQ Waveform Measurement: <code>:WAV:PFIL ON</code>

3.12.4 BW

For this measurement, bandwidth is determined by the algorithm, and is not user-adjustable.

3.12.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.12.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Display Type

Allows you to display Phase and Amplitude traces in absolute values, or values relative to the 1st sample point's phase and amplitude. The 1st sample point's phase and amplitude are different from the Relative Baseline values, which only reflect the segment averaged phase and amplitude values. Setting **Display Type** to **RELative** enables the phase and amplitude traces to start from 0 degree and 0 dB, so there is no need to adjust scale or reference between measurements.

Remote Command	<code>:DISPlay:PAVTime:TYPE ABSolute RELative</code> <code>:DISPlay:PAVTime:TYPE?</code>
Example	<code>:DISP:PAVT:TYPE REL</code> <code>:DISP:PAVT:TYPE?</code>
Preset	<code>ABSolute</code>
State Saved	Yes
Range	<code>ABSolute RELative</code>

3.12.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

The PAVT measurement has one view: "Normal" on page 2610.

This is a multiple-window View. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Normal

Windows: "Graph" on page 2561, "Results" on page 2561

The PAVT measurement provides tabular result and graphical display.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOOM</code>) with</p> <pre>:DISP:VIEW:ADV:SEL</pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <pre>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</pre>

	<p>If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>
Backwards Compatibility SCPI	<p>The legacy node <code>:DISPlay:VIEW[:SElect]</code> is retained for backwards compatibility, but it only supports predefined views</p>

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:NAME “Baseband”</code> Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated</p>

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete:ALL</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	<p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p> <p>If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined</p>

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	<p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2616), then query the list of available Views, the result is undefined</p>

3.12.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
----------------	--

Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are using either the `:SYSTEM:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPLAY:VIEW:ADVANCED:SELECT</code>
Rename User View	<code>:DISPLAY:VIEW:ADVANCED:RENAME</code>
Delete User View	<code>:DISPLAY:VIEW:ADVANCED:DELETE</code>
Create User View	<code>:DISPLAY:VIEW:ADVANCED:NAME</code>
Select Screen	<code>:INSTRUMENT:SCREEN:SELECT</code>
Delete Screen	<code>:INSTRUMENT:SCREEN:DELETE</code>

Name	Command
Delete All But This Screen	:INSTRUMENT:SCREEN:DELETE:ALL
Add Screen	:INSTRUMENT:SCREEN:CREATE
Rename Screen	:INSTRUMENT:SCREEN:RENAME
Sequencer On/Off	:SYSTEM:SEQUENCER
Remote Command	:DISPLAY:ENABLE OFF ON 0 1 :DISPLAY:ENABLE?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTEM:PRESET
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPLAY:ENABLE as it did in legacy analyzers

3.12.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency parameters of the instrument.

Some features in this menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements – it does not change as you change measurements.

3.12.6.1 Settings

Contains controls that pertain to the frequency parameters of the measurement. These parameters control where the instrument is tuned, and implications to the measurement algorithm.

Center Frequency

This function sets (and queries) the **Center Frequency** for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center**

Frequency changes to the value for that input. SCPI commands are available to directly set the value for a specific input.

Center Frequency is remembered as you go from input to input.

See:

- ["RF Center Freq" on page 2620](#)
- ["Ext Mix Center Freq" on page 2621](#)
- ["I/Q Center Freq" on page 2622](#)
- ["Center Frequency Presets" on page 2619](#)

Remote Command	<code>[:SENSE] :FREQUENCY:CENTer <freq></code> <code>[:SENSE] :FREQUENCY:CENTer?</code>
Example	<code>:FREQ:CENT 50 MHz</code> sets Center Frequency to 50 MHz <code>:FREQ:CENT UP</code> increments the Center Frequency by the value of CF Step <code>:FREQ:CENT?</code> returns the current value of Center Frequency
Notes	Preset and Max values are dependent on Hardware Options (5xx), port selections or other aspects of the particular instrument in use If no terminator (e.g., MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Couplings	For E7760A, if the Input Port selected is a mmWave port, and option RF4 is not present, the frequency of the instrument and source must be the same. Thus, changing this instrument frequency will also update the source frequency. If option RF4 is present, the frequency of the instrument and source are independent
Preset	Depends on instrument's maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 2619 , "RF Center Freq" on page 2620 , "Ext Mix Center Freq" on page 2621 , and "I/Q Center Freq" on page 2622
State Saved	Saved in instrument state
Min	Depends on instrument's maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 2619 , "RF Center Freq" on page 2620 , "Ext Mix Center Freq" on page 2621 , and "I/Q Center Freq" on page 2622
Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 2619 , "RF Center Freq" on page 2620 , "Ext Mix Center Freq" on page 2621 , and "I/Q Center Freq" on page 2622
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (SP900B/21A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (SP900B/21A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (SP900B/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (SP900B)	1 GHz	1.08 GHz	6.6 GHz
F08 (SP900B)	1 GHz	1.08 GHz	8.6 GHz
F12 (SP900B)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

SP900SCenter Freq Presets

3 5G NR Mode
 3.12 Phase and Amplitude vs Time Measurement

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

RF Center Freq

Specifies the RF Center Frequency. This command sets the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command `[:SENSe]:FREQuency:RF:CENTer <freq>`
`[:SENSe]:FREQuency:RF:CENTer?`

Example `:FREQ:RF:CENT 30 MHz`

:FREQ:RF:CEN?	
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically, instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on Span

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. This command sets the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	[:SENSe] :FREQuency:EMIXer:CENTer <freq> [:SENSe] :FREQuency:EMIXer:CENTer?
Example	:FREQ:EMIX:CEN 60 GHz :FREQ:EMIX:CEN?
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	Ext Mix Center Freq is not available in VXT Models SP900B/11A
Couplings	When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will come back into the settings that you had when you left External Mixing. So you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table

	When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on Span
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on Span

I/Q Center Freq

Specifies the I/Q Center Frequency. This command sets the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe]:FREQuency:IQ:CENTer <freq></code> <code>[:SENSe]:FREQuency:IQ:CENTer?</code>
Example	<code>:FREQ:IQ:CENT 30 MHz</code>
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	I/Q Center Freq is not available in VXT Models SP900B/11A
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

Carrier Reference Frequency

Sets Carrier Reference Frequency. The center frequencies of carriers are defined as offset frequency from this value. This reference frequency is also the reference of carrier configuration preset.

Because 5G NR measurements often deal with multiple carriers with distinct bandwidths, the simple Center Frequency parameter used in most measurements does not apply here. Instead, the Carrier Reference Frequency is the key parameter. This must be distinct from the Center Frequency parameter used in other measurements, as Center Frequency can be a global parameter, and it would not make sense for Carrier Reference Frequency to take on this global value.

In 5G NR, if the following conditions are satisfied at the same time:

- the Number of Component Carrier is 1
- the Center Freq Offset is 0 Hz
- the Center Freq mode is Auto

then Center Freq is equivalent to Carrier Ref Freq. When the Center Freq changes in such conditions, the mode of the Center Freq remains as Auto and the Carrier Ref Freq changes to the same value.

Remote Command	<code>[:SENSe]:CCARrier:REFerence <freq></code> <code>[:SENSe]:CCARrier:REFerence?</code>
Example	<code>:CCAR:REF 2GHz</code> <code>:CCAR:REF?</code>
Dependencies	Only available in the 5G NR Mode
Preset	1GHz
State Saved	Saved in instrument state
Min/Max	Depends on instrument minimum/maximum center frequency. Same as " Center Frequency " on page 2617

CF Step

Changes the step size for "[Center Frequency](#)" on page 2617, and start/stop frequency functions. Once a step size has been selected and the Center Frequency function is active, the step keys (and the **UP | DOWN** parameters for Center Frequency from remote commands) change Center Frequency by the step-size value.

Remote Command	<code>[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq></code> <code>[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?</code> <code>[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF ON 0 1</code> <code>[:SENSe]:FREQuency:CENTer:STEP:AUTO?</code>
Example	<code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code> increases the current center frequency value by 500 MHz <code>:FREQ:CENT:STEP?</code> <code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code>
Notes	Preset and Max values are depending on Hardware Options (503, 507, 508, 513, 526)
Dependencies	Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent

3 5G NR Mode
3.12 Phase and Amplitude vs Time Measurement

	SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning This control does not appear in 5G NR Mode
Couplings	When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span. When auto-coupled in zero span, the center frequency step size is set to the equivalent -3 dB RBW value
Preset	Auto ON
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Freq Offset

Enables you to set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a Mode Preset or set the frequency offset to 0 Hz.

See "[More Information](#)" on page 2625.

Remote Command	<code>[:SENSe] :FREQuency:OFFSet <freq></code> <code>[:SENSe] :FREQuency:OFFSet?</code>
Example	<code>:FREQ:OFFS 10 MHz</code> <code>:FREQ:OFFS?</code>
Notes	Preset and Max values are dependent on Hardware Options (503, 507, 508, 513, 526)
Preset	See " Center Frequency Presets " on page 2619
State Saved	Saved in instrument state
Min	-500 GHz
Max	500 GHz
Annotation	If Frequency Offset is not zero, “Freq Offset <value>” appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped

More Information

This command does not affect any bandwidths or the settings of relative frequency parameters such as delta markers or span. It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by Freq Offset. Changing the offset, even on a trace that is not updating will immediately change all of the above, without taking new data.

NOTE

If a trace is exported with a nonzero Freq Offset, the exported data will contain the trace data with the offset applied. Therefore, if that trace were to be imported back into the instrument, you would want Freq Offset to be 0, or the offset would be applied again to data that is already offset. No such care need be taken when saving a State+Trace file because the data and state are saved together.

Center Frequency Offset

Sets Center Frequency Offset, which is coupled with center frequency, but is only used in the Monitor Spectrum, IQ Waveform, Power Stat CCDF and PAVT measurements. The Center Frequency, Center Frequency Offset and Carrier Reference Frequency are coupled with this equation:

$$\text{Center Frequency} = \text{Carrier Reference Frequency} + \text{Center Frequency Offset.}$$

When you change **Center Frequency Offset** explicitly, **Center Frequency** is updated and **Carrier Reference Frequency** is not.

Remote Command	<code>[:SENSe] :FREQuency:CENTer:OFFSet <freq></code> <code>[:SENSe] :FREQuency:CENTer:OFFSet?</code>
Example	<code>:FREQ:CENT:OFFS 100kHz</code> <code>:FREQ:CENT:OFFS?</code>
Dependencies	Only available in 5G NR Mode
Preset	0 GHz
State Saved	Saved in instrument state
Min	-500 GHz
Max	500 GHz

3.12.7 Marker

There is no **Marker** functionality in the PAVT Measurement.

3.12.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.12.8.1 Settings

Contains frequently used Meas Setup functions to which you will want the fastest access.

Segments

Sets the number of measurement results. A Segment is comprised of a Measurement Offset, Measurement Interval, and Measurement Transient.

Remote Command	<code>[:SENSe]:PAVTime:SEGMents <integer></code> <code>[:SENSe]:PAVTime:SEGMents?</code>
Example	<code>:PAVT:SEGM 360</code> <code>:PAVT:SEGM?</code>
Preset	180
State Saved	Saved in instrument state
Min	1
Max	1000

Total Meas Time

Information only. Returns the result of (Meas Offset + Meas Interval + Meas Transient)*Segments.

Remote Command	<code>[:SENSe]:PAVTime:MTIME?</code>
Example	<code>:PAVT:MTIM?</code>
State Saved	Saved in instrument state

Meas Interval

Sets the duration of acquisition window within the segment.

Remote Command	<code>[:SENSe]:PAVTime:SEGMents:INTERval <time></code> <code>[:SENSe]:PAVTime:SEGMents:INTERval?</code>
----------------	--

Example	<code>:PAVT:SEGM:INT 10 us</code> <code>:PAVT:SEGM:INT?</code>
Couplings	Meas Interval must be > 0 s and less than (Max Capture Length/Segments) - Meas Offset - Meas Transient
Preset	1 ms
State Saved	Saved in instrument state
Min	100 ns
Max	(Max Capture Length/Segments) - Meas Offset - Meas Transient

Meas Offset

Sets the offset prior to "Meas Interval" on page 2626 within the segment.

Remote Command	<code>[:SENSe]:PAVTime:SEGMents:OFFSet <time></code> <code>[:SENSe]:PAVTime:SEGMents:OFFSet?</code>
Example	<code>:PAVT:SEGM:OFFS 1 us</code> <code>:PAVT:SEGM:OFFS?</code>
Couplings	Meas Offset must be >= 0 s and less than (Max Capture Length/Segments) - Meas Interval - Meas Transient
Preset	0
State Saved	Saved in instrument state
Min	0
Max	(Max Capture Length/Segments) - Meas Interval - Meas Transient

Meas Transient

Sets the time between the end of the "Meas Interval" on page 2626 and the end of the segment.

Remote Command	<code>[:SENSe]:PAVTime:SEGMents:TRANsient <time></code> <code>[:SENSe]:PAVTime:SEGMents:TRANsient?</code>
Example	<code>:PAVT:SEGM:TRAN 1 us</code> <code>:PAVT:SEGM:TRAN?</code>
Couplings	Meas Transient must be >= 0 s and less than (Max Capture Length/Segments) - Meas Offset - Meas Interval
Preset	0
State Saved	Saved in instrument state
Min/Max	Min = 0 Max = (Max Capture Length/Segments) - Meas Offset - Meas Interval

Measure Frequency Error

Measures the frequency error of the input signal at the center frequency.

This is an "immediate action" function, that is, it executes once, when the control is pressed; the trigger is effectively Free Run, because the acquisition occurs immediately regardless of the instrument trigger setting.

Remote Command	<code>[:SENSe] :PAVTime:FERRor:IMMediate</code>
Example	<code>:PAVT:FERR:IMM</code>
Status Bits/OPC dependencies	Non-overlapped

Frequency Error

The offset of the input signal from the Center Frequency. The frequency error can be determined by the instrument using "[Measure Frequency Error](#)" on page 2628, or is can be supplied by the user.

Remote Command	<code>[:SENSe] :PAVTime:FERRor <freq></code> <code>[:SENSe] :PAVTime:FERRor?</code>
Example	<code>:PAVT:FERR 10 MHz</code> <code>:PAVT:FERR?</code>
Preset	0 Hz
State Saved	Saved in instrument state
Min	-100 MHz
Max	100 MHz
Status Bits/OPC dependencies	Non-overlapped

Frequency Error Measurement Time

Sets the acquisition time for "[Measure Frequency Error](#)" on page 2628.

Remote Command	<code>[:SENSe] :PAVTime:FERRor:TIME <time></code> <code>[:SENSe] :PAVTime:FERRor:TIME?</code>
Example	<code>:PAVT:FERR:TIME 1 us</code> <code>:PAVT:FERR:TIME?</code>
Preset	10 ms
State Saved	Saved in instrument state
Min/Max	100 ns/500 ms

Segment Frequency Error Correction

Sets the Segment Frequency Error Correction to On or Off. When **ON**, frequency error is calculated simultaneously with each sample point's IQ values. The phase results are compensated with this real time frequency error, as well as the **Frequency Error** entered by user or calculated by "**Measure Frequency Error**" on page 2628.

Remote Command	<code>[:SENSe]:PAVTime:FERRor:CORRection[:STATe] OFF ON 0 1</code> <code>[:SENSe]:PAVTime:FERRor:CORRection[:STATe]?</code>
Example	<code>:PAVT:FERR:CORR ON</code> <code>:PAVT:FERR:CORR?</code>
Preset	OFF
State Saved	Saved in instrument state

Sync Type (Models with Multiple Receivers only)

Sets the Sync Type when multiple receivers in one instrument need to sync at data acquisition. This setting is available when the instrument supports multiple receivers. Only one receiver can be set as Primary, and the others can only be set as Secondary.

Remote Command	<code>[:SENSe]:PAVTime:SYNC OFF PRIMary SECondary</code> <code>[:SENSe]:PAVTime:SYNC?</code>
Example	<code>:PAVT:SYNC SEC</code> <code>:PAVT:SYNC?</code>
Notes	UXM: Only Transceiver A can be configured as Primary, and Transceiver B as Secondary. Otherwise, an error message is issued This control appears only in models with multiple receivers
Preset	OFF
State Saved	Yes
Range	OFF Primary Secondary

Auto Couple

Immediately puts all Auto/Man functions into Auto. The **Auto Couple** action is confined to the current measurement only. It does not affect other measurements in the Mode.

In the Auto state, Auto/Man functions are said to be "coupled", meaning their values change as you make changes to other values in the measurement. This

helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the Auto/Man controls for the current measurement are set to Auto, and all measurement settings coupled to the Auto/Man parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 2630 below.

Remote Command	:COUPlE ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards Compatibility Notes	:COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All Auto/Man parameter couplings in the measurement are set to Auto. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no Auto/Man coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in Auto.

Any Auto/Man selection specific (local) to the other measurements in the current Mode will not be affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as "AutoRange" or "AutoScale", will not be affected.

Executing the **Auto Couple** command generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to Auto, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that are dependent on one or more other parameters. The coupling and dependency rules for each parameter are defined in the chapter describing that parameter.

Executing the **Auto Couple** command *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI

Parameters affected by Auto Couple are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time
- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics

For Harmonics, these parameters are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	<code>:CONFigure:PAVTime</code>
Example	<code>:CONF:PAVT</code>
Couplings	Selecting Meas Preset restores all measurement parameters to their default values

3.12.8.2 Radio

The Radio tab contains controls to select link direction.

Direction

Direction specifies whether the 5G NR signal is an uplink signal or a downlink signal.

This control allows you to set the Direction of the signal being measured.

Remote Command	<code>[:SENSe]:RADio:STANdard:DIRectio DLINK ULINK</code> <code>[:SENSe]:RADio:STANdard:DIRectio?</code>
Example	<code>:RAD:STAN:DIR DLIN</code>
Dependencies	When N9085EM0E is not installed and N9085EM4E is installed, only Uplink is available
Couplings	<p>Changing the direction affects the gate source as follows</p> <ul style="list-style-type: none"> - If changed to uplink: RF burst - If changed to downlink: External 1 <p>In Transmit On Off Power, changing the direction affects the trigger source as follows</p> <ul style="list-style-type: none"> - If changed to uplink: Periodic - If changed to downlink: External 1 except for models with the H1G option. With the H1G option, the trigger source changes as follows. <ul style="list-style-type: none"> - External 1, when Info BW \leq 255 MHz - External 3, when Info BW \geq 256 MHz <p>Changing the direction affects many other modulation analysis setup parameters</p>
Preset	ULINK when N9085EM0E is not installed and N9085EM4E is installed Otherwise, DLINK
State Saved	Yes
Range	Uplink only when N9085EM0E is not installed and N9085EM4E is installed Otherwise, Downlink Uplink

3.12.8.3 Component Carriers

Contains settings that let you configure the analyzer to match the component carriers in your 5G NR signal.

Number of Component Carriers

Specifies how many component carriers are included in the 5G NR measurements. The 5G NR supports the maximum of 16 component carriers.

Remote Command	<code>[:SENSe]:CCARrier:COUNT <integer></code> <code>[:SENSe]:CCARrier:COUNT?</code>
Example	<code>:CCAR:COUN 1</code> <code>:CCAR:COUN?</code>
Preset	1
State Saved	Yes
Min	1
Max	16

Carrier Allocation

Specifies the carrier frequency allocation. There are two types of allocation, contiguous and non-contiguous. Non-Contiguous frequency allocation is defined as an allocation where two sub-blocks are separated with a sub-block gap:

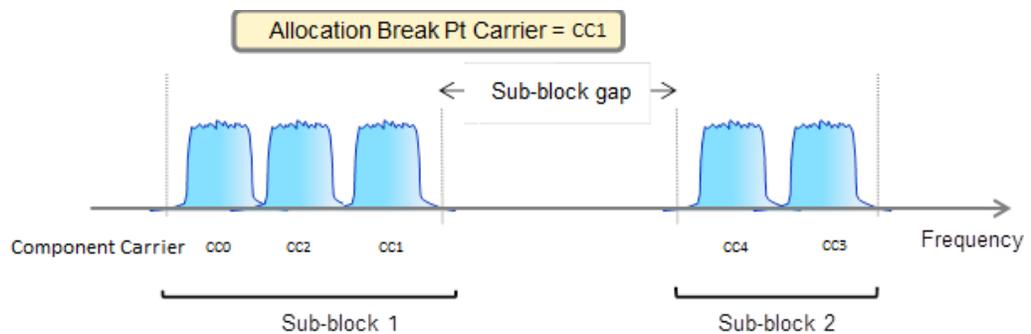

- Contiguous – All the component carriers belong to one block and no sub-block gap exists
- Non-Contiguous – Component carriers are separated into two sub-blocks. Allocation Break Pt Carrier determines how sub-blocks are configured

Remote Command	<code>[:SENSe]:CCARrier:CONFig:ALLocation CONTiguous NCONTiguous</code> <code>[:SENSe]:CCARrier:CONFig:ALLocation?</code>
Example	<code>:CCAR:CONF:ALL CONT</code> <code>:CCAR:CONF:ALL?</code>
Preset	<code>CONTiguous</code>
State Saved	Saved in instrument state
Range	Contiguous Non-Contiguous

Non-Contiguous Break at

Specifies an allocation break point in non-contiguous carrier allocation. First sub-block starts from the lowest frequency carrier and stops at the allocation break point carrier. Next sub-block starts from the next upper frequency carrier and ends at the highest frequency carrier.

one example is shown below. In the example carrier indices are not in the order of carrier frequency. In the example, Allocation Break Pt Carrier is CC1. It means that sub-block 1 ends at carrier CC1 and sub-block 2 starts at carrier CC4. Sub-block gap is located between carrier CC1 and CC4.

Remote Command	<code>[:SENSe]:CCARrier:CONFig:ALlocation:NCONtiguous:ABPoint CC0 ... CC15</code> <code>[:SENSe]:CCARrier:CONFig:ALlocation:NCONtiguous:ABPoint?</code>
Example	<code>:CCAR:CONF:ALL:NCON:ABP CC0</code> <code>:CCAR:CONF:ALL:NCON:ABP?</code>
Dependencies	Allocation Break Point is coupled to Number of Component Carriers. For example, Allocation Break Point list will include CC0~CC1 if the number of Component Carriers is 2
Preset	<code>CC0</code>
State Saved	Saved in instrument state
Range	<code>CC0 ... CC15</code>

Configure Comp Carriers

This dialog lets you perform a detailed configuration of your component carriers, including number of carriers, bandwidth, offset, integration bandwidth, and so on.

Configure CCs

Lets you configure bandwidth, frequency offsets, and integration bandwidth, and also lets you exclude certain carriers from the measurement.

More Information

"Measure Carrier" on page 2636	"Sidelink" on page 2637	"Bandwidth" on page 2637	"Freq Range" on page 2638
"Freq Offset" on page 2638	"Cell ID Auto" on page 2639	"Cell ID Value" on page 2639	"Demod Spectrum" on page 2639

"SCS (Power Meas)" on page 2642			

Number of Component Carriers

This is the same as the control on the menu panel. See ["Number of Component Carriers" on page 2633](#).

Auto Frequency Offset

Changing this value will automatically calculate frequency offset based on a specified set of rules (For the rules, see 5.4.1.1 and 5.4.1.2 in 3GPP TS 38.104 V15.4.0).

Remote Command	<code>[:SENSe]:CCARrier:AFOffset OFF ACRA100K ACRA15K ACRA60K CARA100K CARA15K CARA60K</code> <code>[:SENSe]:CCARrier:AFOffset?</code>
Example	<code>:CCAR:AFOF ACRA100K</code> <code>:CCAR:AFOF?</code>
Notes	When you change the value to OFF , nothing happens
Dependencies	Changing Number of Component Carriers, CC's Bandwidth, or CC's Frequency Range will recalculate frequency offset unless OFF is selected When CC's Frequency Offset is manually changed, this parameter is set to OFF This feature isn't supported when Carrier Allocation is set to Non-Contiguous. When Auto Freq Offset is set to a value other than OFF with Number of Component Carriers = 1, then, CCO Freq Offset is automatically adjusted to 0 Hz
Preset	OFF
State Saved	Yes
Range	The cascading list is shown below
	Channel Spacing for Channel Raster

Adjacent NR Carriers	100 kHz
Carrier Aggregation	15 kHz
Off	60 kHz
Channel Spacing for	Channel Raster
Adjacent NR Carriers	100 kHz
Carrier Aggregation	15 kHz
Off	60 kHz
Channel Spacing for	Channel Raster
Adjacent NR Carriers	
Carrier Aggregation	
Off	

Carrier Allocation

This is the same as the control on the menu panel. See ["Carrier Allocation" on page 2633](#).

Non-Contiguous Break at

This is the same as the control on the menu panel. See ["Non-Contiguous Break at" on page 2634](#).

Measure Carrier

This column sets whether to measure this component carrier or not.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15[:STATe] OFF ON 0 1</code> <code>[:SENSe]:CCARrier[0] 1 ... 15[:STATe]?</code>
Example	<code>:CCAR0 ON</code> <code>:CCAR0?</code>
Notes	The command is used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Couplings	Measure Carrier of the CCs that are within "Number of Component Carriers" is set to ON when the action "Apply Preset (to All CCs)" is executed X
Preset	ON
State Saved	Saved in instrument state

Sidelink

Allows the user to select the mode of component carrier from either normal 5G NR uplink or 5G NR V2X sidelink when Direction is Uplink.

- OFF: The component carrier is 5G NR uplink carrier. The 5G NR uplink parameters per carrier are in scope.
- ON: The component carrier is 5G NR V2X sidelink carrier. The sidelink parameters per carrier are in scope.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:SLInk ON OFF 1 0</code> <code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:SLInk?</code>
Example	<code>CCAR4:RAD:SLIN ON</code> <code>CCAR4:RAD:SLIN?</code>
Dependencies	Available when the required license is installed and Direction is Uplink Unavailable when " Bandwidth " on page 2637 is 35 MHz, 45 MHz, 800 MHz, 1600 MHz, and 2000 MHz
Preset	OFF
State Saved	Saved

Bandwidth

This column enables you to set the bandwidth of each component carrier for 5G NR signal (which also determines the total number of resource blocks for Modulation Analysis measurement).

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:STANdard:BANDwidth B5M B10M B15M B20M B25M B30M B35M B40M B45M B50M B60M B70M B80M B90M B100M B200M B400M B800M B1600M B2000M</code> <code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:STANdard:BANDwidth?</code>
Example	<code>:CCAR4:RAD:STAN:BAND B50M</code>
Dependencies	When " Sidelink " on page 2637 is enabled, 35 MHz, 45 MHz, 800 MHz, 1600 MHz, and 2000 MHz are not available. Selecting any of those BWs turns Sidelink off and the column becomes grayed out
Couplings	This value will be preset to the Bandwidth value in the Meas Standard menu when the action "Apply Preset (to All CCs)" is executed
Preset	B100M
State Saved	Yes
Range	5 MHz 10 MHz 15 MHz 20 MHz 25 MHz 30 MHz 35 MHz 40 MHz 45 MHz 50 MHz 60 MHz 70 MHz 80 MHz 90 MHz 100 MHz 200 MHz 400 MHz 800 MHz 1600 MHz 2000 MHz

Freq Range

This column enables you to set which frequency range to which each component carrier belongs.

Frequency Range affects CC Bandwidth, Max RB Numbers, ACP Measurement Noise Bandwidth and SEM Integ BW.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:STANdard:FRANge FR1 FR2</code> <code>[:SENSe]:CCARrier[0] 1 ... 15:RADio:STANdard:FRANge?</code>
Example	<code>:CCAR1:RAD:STAN:FRAN FR1</code>
Dependencies	Available selections differ depending on "Bandwidth" on page 2637 as follows: <ul style="list-style-type: none"> - 50 MHz and 100 MHz: FR1 and FR2 - 200 MHz or wider: FR2 only - Other than above: FR1 only
Couplings	This value will be preset to the Frequency Range value in the Meas Standard menu when the action "Apply Preset (to All CCs)" is executed
Preset	<code>FR1</code>
State Saved	Yes
Range	<code>FR1 FR2</code>

Freq Offset

This column sets the component carrier center frequency as offset from the Carrier Ref Frequency.

Remote Command	<code>[:SENSe]:CCARrier<n>:FREQuency:OFFSet <freq></code> <code>[:SENSe]:CCARrier<n>:FREQuency:OFFSet?</code>
Example	<code>:CCAR4:FREQ:OFFS 10MHz</code> <code>:CCAR4:FREQ:OFFS?</code>
Notes	Used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers Frequency Offset of CC0 to CC15 is recommended to be set in ascending order for the best related couplings. You can see whether sub-blocks are configured as you expect in the trace of Monitor Spectrum by turning on Sub-block Attribute under Display > Meas Display. If sub-blocks are not configured correctly, results related to sub-block gap such as ACP/SEM inner offset results are not measured correctly Also, in some cases, make sure if the "Non-Contiguous Break at" parameter is set to the intended value since it's often left unchanged after Frequency Offset of CCs are changed

Preset	0 Hz
State Saved	Saved in instrument state
Min	-50 GHz
Max	50 GHz

Cell ID Auto

Enable and disable Cell ID auto detection based on SSB.

NOTE

This setting is available for EVM measurement only.

Remote Command	<code>[[:SENSe]:EVM:CCARrier[0] 1 ... 15:CID:MODE AUTO MANua1 [:SENSe]:EVM:CCARrier[0] 1 ... 15:CID:MODE?</code>
Example	<code>:EVM:CCAR:CID:MODE MAN :EVM:CCAR:CID:MODE?</code>
Preset	<code>MANua1</code>
State Saved	Saved in instrument state

Cell ID Value

Specify Cell ID for the component carrier.

NOTE

This setting is available for EVM measurement only.

Remote Command	<code>[[:SENSe]:EVM:CCARrier[0] 1 ... 15:CID <integer> [:SENSe]:EVM:CCARrier[0] 1 ... 15:CID?</code>
Example	<code>:EVM:CCAR4:CID 0 :EVM:CCAR4:CID?</code>
Couplings	Invalid when Cell ID Auto is on
Preset	0
State Saved	Saved in instrument state
Min	0
Max	1007

Demod Spectrum

This column determines if the spectrum of the incoming data is mirrored or not. The actual mirroring is accomplished by conjugating the complex time data.

Note that only the Modulation Analysis measurement and Conformance EVM measurement support this feature.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:SPECTrum NORMal INVert</code> <code>[:SENSe]:CCARrier[0] 1 ... 15:SPECTrum?</code>
Example	<code>:CCAR0:SPEC INV</code> <code>:CCAR0:SPEC?</code>
Preset	<code>NORM</code>
State Saved	Yes
Range	Normal Invert

CHP Power Integration Bandwidth

This column specifies the range of integration used in calculating the power in the component carriers in the CHP measurement.

NOTE This setting is *not* available for EVM.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:CHPower:BANDwidth:INTEgration <freq></code> <code>[:SENSe]:CCARrier[0] 1 ... 15:CHPower:BANDwidth:INTEgration?</code>
Example	<code>:CCAR0:CHP:BAND:INT 20MHz</code> <code>:CCAR0:CHP:BAND:INT?</code>
Couplings	When Bandwidth of the parameter set is changed, this parameter also changes to that value
Preset	100 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	2000 MHz

ACP Power Integration Bandwidth

This column specifies the Measurement Noise Bandwidth used to calculate the power in the component carriers in the ACP measurement.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:ACPpower:BANDwidth[1] 2:INTEgration <freq></code> <code>[:SENSe]:CCARrier[0] 1 ... 15:ACPpower:BANDwidth[1] 2:INTEgration?</code>
Example	<code>:CCAR0:ACP:BAND:INT 20MHz</code> <code>:CCAR0:ACP:BAND:INT?</code>
Notes	Carrier sub op code, 1 is for BTS, 2 for MS. Default is BTS
Couplings	When either Bandwidth of the parameter set, Freq Range, or Direction is changed, the value of this parameter also changes as shown in the following table

When Freq Range is FR1

Bandwidth	Downlink ACP Meas Noise BW (MHz)	Uplink ACP Meas Noise BW (MHz)
5 MHz	4.500	4.515
10 MHz	9.360	9.375
15 MHz	14.220	14.235
20 MHz	19.080	19.095
25 MHz	23.940	23.955
30 MHz	28.800	28.815
35 MHz	33.840	33.855
40 MHz	38.880	38.895
45 MHz	43.560	43.575
50 MHz	48.600	48.615
60 MHz	58.320	58.350
70 MHz	68.040	68.070
80 MHz	78.120	78.150
90 MHz	88.200	88.230
100 MHz	98.280	98.310

When Freq Range is FR2

Bandwidth	Downlink ACP Meas Noise BW (MHz)	Uplink ACP Meas Noise BW (MHz)
50 MHz	47.520	47.580
100 MHz	95.040	95.160
200 MHz	190.080	190.20
400 MHz	380.160	380.280
800 MHz	714.24	715.20
1600 MHz	1428.48	1429.44
2000 MHz	1704.96	1705.92

Preset	98.280 MHz 98.310 MHz
State Saved	Yes
Min	100 kHz
Max	2000 MHz

SEM Power Integration Bandwidth

This column specifies the integration bandwidth used to calculate the power in the component carriers in SEM measurement.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:SEMAsk:BANDwidth[1] 2:INTEgration <freq></code> <code>[:SENSe]:CCARrier[0] 1 ... 15:SEMAsk:BANDwidth[1] 2:INTEgration?</code>
Example	<code>:CCAR0:SEM:BAND:INT 20MHz</code> <code>:CCAR0:SEM:BAND:INT?</code>
Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS
Couplings	When Bandwidth of the parameter set is changed, this parameter also changes to that value
Preset	100 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	2000 MHz

SCS (Power Meas)

Queries the SCS (Power Meas), the smallest SCS among the enabled SCSs of the selected component carrier set with ["SCS Enabled" on page 1547](#).

It is used to calculate the aggregated channel bandwidth when Power Reference is set to Aggregated Chan BW.

Power Integration Bandwidth values are not affected even if SCS (Power Meas) is changed.

Remote Command	<code>[:SENSe]:CCARrier[0] 1 ... 15:RGRid:PMSCs?</code>
Example	<code>:CCAR3:RGR:PMSC?</code>
Notes	Query-only Returns one of the following values: NONE, SCS15K, SCS30K, SCS60K, SCS120K, SCS240K, SCS480K, SCS960K

3.12.8.4 Meas Standard

The tab contains settings which let you configure the analyzer to match the measurement standard in your 5G NR signal.

The section entitled “Configure Preset” lets you configure the preset values for the Component Carriers. Once you have set all the controls in the “Configure Preset” section to the desired value, press the “Apply Preset (to all CCs)” control and your

presets will be applied to each Component Carrier. Furthermore, any new Component Carriers will take on the same values you have applied.

NOTE

You must press *Apply Preset (to all CCs)* or the values on the controls will *not* affect the Component Carriers.

When you need to configure more parameters, select Advanced Preset Parameters to open a dialog and set advanced parameters for multiple measurements on one screen.

Bandwidth

This control is part of the “Configure Presets” section of **Meas Standard**. It lets you set the **"Bandwidth" on page 2637** of each component carrier in the same way you would do so using the table in the **Configure Comp Carriers** dialog on the **Component Carriers** tab.

Set the value you want for this control and the other controls in the “**Configure Preset**” section then press **Apply Preset (to all CCs)**.

NOTE

You must press *Apply Preset (to all CCs)* or the value on this controls will *not* affect the Component Carriers.

Once you have applied this preset value, any new CCs created by setting the **"Number of Component Carriers" on page 2633** will also take on this value.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:CARRier[:BANDwidth] B5M B10M B15M B20M B25M B30M B35M B40M B45M B50M B60M B70M B80M B90M B100M B200M B400M B800M B1600M B2000M</code> <code>[:SENSe]:RADio:STANdard:PRESet:CARRier[:BANDwidth]?</code>
Example	<code>:RAD:STAN:PRES:CARR B5M</code> <code>:RAD:STAN:PRES:CARR?</code>
Dependencies	Selections other than 10 MHz, 20 MHz, 30 MHz, and 40 MHz are unavailable when "Uplink Carrier Mode" on page 2648 is Sidelink - V2X If you change "Uplink Carrier Mode" on page 2648 to Sidelink – V2X when this parameter is set to a value other than 10 MHz, 20 MHz, 30 MHz, or 40 MHz, it is forcefully set to 10 MHz
Preset	When N9085EM0E is not installed and N9085EM4E is installed: B10M Otherwise: B100M
State Saved	Yes
Range	5 MHz 10 MHz 15 MHz 20 MHz 25 MHz 30 MHz 35 MHz 40 MHz 45 MHz 50 MHz 60 MHz 70 MHz 80 MHz 90 MHz 100 MHz 200 MHz 400 MHz 800 MHz 1600 MHz 2000 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:RADio:STANdard:PRESet[:BANDwidth]</code>

Frequency Range

This control is part of the “Configure Presets” section of **Meas Standard**. It lets you set the **"Freq Range" on page 2638** of each component carrier in the same way you would do so using the table in the **Configure Comp Carriers** dialog on the **Component Carriers** tab.

Set the value you want for this control and the other controls in the “Configure Preset” section then press **Apply Preset (to all CCs)**.

NOTE You must press **Apply Preset (to all CCs)** or the value on this controls will *not* affect the Component Carriers.

Once you have applied this preset value, any new CCs created by setting the **"Number of Component Carriers" on page 2633** will also take on this value.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:FREQuency:RANGe FR1 FR2</code> <code>[:SENSe]:RADio:STANdard:PRESet:FREQuency:RANGe?</code>
Example	<code>:RAD:STAN:PRES:FREQ:RANG FR1</code> <code>:RAD:STAN:PRES:FREQ:RANG?</code>
Dependencies	Available selections differ depending on Bandwidth as follows: <ul style="list-style-type: none"> - 50 MHz and 100 MHz: FR1 and FR2 - 200 MHz or wider: FR2 only - Other than above: FR1 only <p>When "Uplink Carrier Mode" on page 2648 is Sidelink - V2X, FR2 is unavailable</p>
Preset	<code>FR1</code>
State Saved	Yes
Range	FR1 FR2
Backwards Compatibility SCPI	<code>[:SENSe]:RADio:STANdard:PRESet:FRANGe</code>

Duplex Mode

This control is part of the “Configure Presets” section of **Meas Standard**. It lets you set the Duplex Mode of each component carrier. Set the value you want for this control and the other controls in the “Configure Preset” section then press “Apply Preset (to all CCs)”.

NOTE You must press **Apply Preset (to all CCs)** or the value on this controls will *not* affect the Component Carriers.

Once you have applied this preset value, any new CCs created by setting the "Number of Component Carriers" on page 2633 will also take on this value.

Two types of Duplex Mode (FDD and TDD) are supported.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:DMODE FDD TDD</code> <code>[:SENSe]:RADio:STANdard:PRESet:DMODE?</code>
Example	<code>:RAD:STAN:PRESet:DMOD TDD</code> <code>:RAD:STAN:PRESet:DMOD?</code>
Dependencies	Available selections depend on Frequency Range When FR1 is selected, both TDD and FDD are available. When FR2 is selected, only TDD is available
Preset	TDD
State Saved	Yes
Range	FDD TDD

SCS

This control is part of the “Configure Presets” section of **Meas Standard**. It lets you set the subcarrier spacing of each component carrier. Set the value you want for this control and the other controls in the “Configure Preset” section then press “Apply Preset (to all CCs)”.

NOTE You must press **Apply Preset (to all CCs)** or the value on this controls will *not* affect the Component Carriers.

Once you have applied this preset value, any new CCs created by setting the "Number of Component Carriers" on page 2633 will also take on this value.

In 5G, subcarrier spacing is governed by $2^n * 15$ kHz subcarrier spacings (where n is 0, 1, 2, or 3). 15, 30, and 60 kHz subcarrier spacings are used for the lower frequency bands, and 60 and 120 kHz subcarrier spacings are used for the higher frequency bands.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:SCS SCS15K SCS30K SCS60K SCS120K SCS480K SCS960K</code> <code>[:SENSe]:RADio:STANdard:PRESet:SCS?</code> <code>[:SENSe]:RADio:STANdard:PRESet:SCS:AUTO[:STATe] OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:SCS:AUTO[:STATe]?</code>

RB Alloc Preset

This control is part of the “Configure Presets” section of **Meas Standard**. It lets you set the Resource Block Allocation Preset of each component carrier. Set the value you want for this control and the other controls in the “Configure Preset” section then press “Apply Preset (to all CCs)”.

NOTE

You must press **Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.**

Once you have applied this preset value, any new CCs created by setting the "Number of Component Carriers" on page 2633 will also take on this value.

The RB Alloc Preset presets the Resource Block (RB) allocation mapping to a selected predefined pattern in the list:

"Fulfilled-xxx" is to fill out all maximum available RBs in each CC with one specified modulation type (Pi/2-BPSK | QPSK | 16 QAM | 64 QAM | 256 QAM | 1024 QAM), and "DL-NR-TM x.x" is to map RBs in each CC based on the NR Test Model definition according to the section 4.9.2 in 3GPP TS38.141-1 or -2.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:RBALloc FQPSK FQAM16 FQAM64 FQAM256 FQAM1024 DLTM1DOT1 DLTM1DOT2 DLTM2 DLTM2Q16 DLTM2QPS DLTM2A DLTM2B DLTM3DOT1 DLTM3DOT1Q16 DLTM3DOT1QPS DLTM3DOT1A DLTM3DOT1B DLTM3DOT2 DLTM3DOT3 FPIBPSK DLTM1DOT1P1 DLTM1DOT1L2</code> <code>[:SENSe]:RADio:STANdard:PRESet:RBALloc?</code>

Advanced Preset Parameters

Lets you access advanced preset parameters on one screen.

Uplink Carrier Mode

Allows you to select the uplink carrier mode: either Normal Uplink or Sidelink - V2X.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:ULINK:CARRier NORMa1 V2X</code> <code>[:SENSe]:RADio:STANdard:PRESet:ULINK:CARRier?</code>
Example	<code>RAD:STAN:PRES:ULIN:CARR NORM</code> <code>RAD:STAN:PRES:ULIN:CARR?</code>
Dependencies	Available when the required license is installed and Direction is Uplink
Preset	When N9085EM0E is not installed and N9085EM4E is installed: V2X Otherwise: NORMa1
State Saved	Saved
Range	Normal Uplink Sidelink-V2X

DL FR1 NR-TM Reference Standard Selection

Enables you to select the 3GPP Standard for the DL FR1 TDD NR-TM lists of Resource Block Allocation Preset to be referred to; one is 3GPP TS38.141-1 and the other is 3GPP TS37.141 BC3 CS16/17, which define different TDD burst On/Off profiles.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:DLINK:NRTM TS38 TS37CS1617</code> <code>[:SENSe]:RADio:STANdard:PRESet:DLINK:NRTM?</code>
Example	<code>RAD:STAN:PRES:DLIN:NRTM TS38</code> <code>RAD:STAN:PRES:DLIN:NRTM?</code>
Dependencies	Grayed out when Radio Direction is Uplink.
Couplings	Values to be preset will not be preset until the action “Apply Preset (to All CCs)” is executed.
Preset	TS38
State Saved	Yes
Range	TS38.141-1 TS37.141 BC3 CS16/17

OFDM Type

This control is part of the “Preset for Mod Analysis” section of the Advanced Preset Parameters dialog. It lets you specify the OFDM Type to configure preset values for the Component Carriers:

- CP-OFDM
- DFT-s-OFDM

Set the value you want for this control and the other controls in the “Configure Preset” section, and then press “Apply Preset (to all CCs)”.

NOTE You must press **Apply Preset (to all CCs)** or the value on this controls will *not* affect the Component Carriers.

Once you have applied this preset value, any new CCs created by setting the Number of Component Carriers will also take on this value.

This parameter is valid only for the Modulation Analysis measurement.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:OTYPE CPOFdm DFTSofdm</code> <code>[:SENSe]:RADio:STANdard:PRESet:OTYPE?</code>
Example	<code>:RAD:STAN:PRES:OTYP CPOF</code> <code>:RAD:STAN:PRES:OTYP?</code>

Dependencies	DFT-s-OFDM is grayed out when Radio Direction is Downlink DFT-s-OFDM is grayed-out when "Uplink Carrier Mode" on page 2648 is Sidelink - V2X
Couplings	Values to be preset will not be preset until the action "Apply Preset (to All CCs)" is executed
Preset	CPOFdm
State Saved	Yes
Range	CP-OFDM DFT-s-OFDM

Adjust Limit Mask for Freq Range

This control is part of the "Preset for ACP, SEM, Spur, Tx On|Off Power" section of the Advanced Preset Parameters dialog. It lets you specify the frequency range for preset.

Set the value you want for this control and the other controls in the "Configure Preset" section, and then press "Apply Preset (to all CCs)".

NOTE

You must press **Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.**

When in Auto, this value changes when f value is changed, where f is the center frequency of Component Carrier 0. Values to be preset will be preset to the values described in the Values for Meas Standard section when Apply Preset is executed.

When in Manual, values to be preset will be preset to the values described in Values or Meas Standard according to this value when Apply Preset is executed.

This parameter is valid for the ACP, SEM, Transmit On|Off Power, and Spurious Emissions measurements.

Remote Command	<pre>[:SENSe]:RADio:STANdard:PRESet:ADJust:FRANge NONE FT01 F1T03 F3T04P2 F4P2T06 F6T07 F24P25T029P5 F37T040 F43T048 F52T071 [:SENSe]:RADio:STANdard:PRESet:ADJust:FRANge? Example	<pre>:RAD:STAN:PRESet:ADJ:FRAN F1T03 :RAD:STAN:PRESet:ADJ:FRAN? :RAD:STAN:PRESet:ADJ:FRAN:AUTO 1 :RAD:STAN:PRESet:ADJ:FRAN:AUTO?</pre>
Dependencies	Available selections depend on Frequency Range and Bandwidth When Freq Range = FR1 - $f \leq 1.0$ GHz

-
- $f < 3.0$ GHz
 - $3.0 < f \leq 4.2$ GHz
 - $4.2 < f \leq 6.0$ GHz
 - $6.0 < f \leq 7.125$ GHz

When Freq Range = FR2 and Bandwidth = 50 or 200 MHz

- $24.25 < f \leq 29.5$ GHz
- $37.0 < f \leq 43.5$ GHz
- $43.5 < f \leq 48.2$ GHz

When Freq Range = FR2 and Bandwidth = 100 or 400 MHz

- $24.25 < f \leq 29.5$ GHz
- $37.0 < f \leq 43.5$ GHz
- $43.5 < f \leq 48.2$ GHz
- $52.6 < f \leq 71.0$ GHz

When Freq Range = FR2 and Bandwidth = 800 MHz or wider

- $52.6 < f \leq 71.0$ GHz

Couplings	When in Auto, this value changes when f value is changed, where f is the center frequency of Component Carrier 0 Adjust Limit Mask for freq Range will not be preset to the selected one until the action "Apply Preset (to All CCs)" is executed
Preset	Automatically selected The selection depends on which listed range the CC0 center freq is in ON
State Saved	Yes Yes
Range	None $f \leq 1.0$ GHz $1.0 < f \leq 3.0$ GHz $3.0 < f \leq 4.2$ GHz $4.2 < f \leq 6.0$ GHz $6.0 < f \leq 7.125$ GHz $24.25 < f \leq 29.5$ GHz $37.0 < f \leq 43.5$ GHz $43.5 < f \leq 48.2$ GHz $52.6 < f \leq 71.0$ GHz

BS Type

This control is part of the "Preset for ACP, SEM, Spur, Tx On|Off Power" section of the Advanced Preset Parameters dialog. It lets you specify the BS Type for preset:

- 1-C (FR1 Conducted)
- 1-O (FR1 Radiated)

- 2-0 (FR2 Radiated)

Set the value you want for this control and the other controls in the “Configure Preset” section, and then press “Apply Preset (to all CCs)”.

NOTE You must press **Apply Preset (to all CCs)** or the value on this controls will *not* affect the Component Carriers.

This parameter is valid for the ACP, SEM, Transmit On|Off Power, and Spurious Emissions measurements.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:DLINK:BS:TYPE FR1C FR10 FR20</code> <code>[:SENSe]:RADio:STANdard:PRESet:DLINK:BS:TYPE?</code>
Example	<code>:RAD:STAN:PRES:DLIN:BS:TYPE FR1C</code> <code>:RAD:STAN:PRES:DLIN:BS:TYPE?</code>
Dependencies	Grayed out when Radio Direction is Uplink
Couplings	Values to be preset will not be preset until the action “Apply Preset (to All CCs)” is executed
Preset	<code>FR1C</code>
State Saved	Yes
Range	1-C (FR1 Conducted) 1-0 (FR1 Radiated) 2-0 (FR2 Radiated)

BS Category

This control is part of the “Preset for ACP, SEM, Spur, Tx On|Off Power” section of the Advanced Preset Parameters dialog. It lets you specify the BS Category for preset:

- Category A Wide Area BS
- Category B Wide Area BS
- Category A Medium Range BS
- Category B Medium Range BS
- Category A Medium Range BS (Low Power rated)
- Category B Medium Range BS (Low Power rated)
- Category A Local Area BS
- Category B Local Area BS

Set the value you want for this control and the other controls in the “Configure Preset” section, and then press “Apply Preset (to all CCs)”.

NOTE

You must press **Apply Preset (to all CCs)** or the value on this controls will *not* affect the Component Carriers.

This parameter is valid for the ACP, SEM, Transmit On|Off Power, and Spurious Emissions measurements.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:DLINK:BS:CATegory AWARea BWARea AMRange BMRRange AMRLow BMRLow ALARea BLARea</code> <code>[:SENSe]:RADio:STANdard:PRESet:DLINK:BS:CATegory?</code>

Preset	<code>BWARea</code>
State Saved	Yes
Range	Category A Wide Area BS Category B Wide Area BS Category A Medium Range BS Category B Medium Range BS Category A Medium Range BS (Low Power rated) Category B Medium Range BS (Low Power rated) Category A Local Area BS Category B Local Area BS

Assumed Adjacent Channels

This control is part of the “Preset for ACP, Mod Analysis” section of the Advanced Preset Parameters dialog. It lets you set the Assumed Adjacent Channels for carrier configuration preset. Set the value you want for this control and the other controls in the “Configure Preset” section, then press “Apply Preset (to all CCs)” to execute preset. See the Values for Meas Standard section for the parameters to be preset.

Downlink

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:DLINK:ACHannel[:TYPE] NR EUTRa NREutra</code> <code>[:SENSe]:RADio:STANdard:PRESet:DLINK:ACHannel[:TYPE]?</code>
Example	<code>:RAD:STAN:PRES:DLIN:ACH NR</code> <code>:RAD:STAN:PRES:DLIN:ACH?</code>
Dependencies	UTRA and NR+UTRA are grayed-out when “Uplink Carrier Mode” on page 2648 is Sidelink - V2X
Preset	<code>NR</code>
State Saved	Yes
Range	NR (same BW) E-UTRA NR + E-UTRA

Uplink

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:ULINK:ACHannel[:TYPE] NR UTRa NRUTra</code> <code>[:SENSe]:RADio:STANdard:PRESet:ULINK:ACHannel[:TYPE]?</code>
Example	<code>:RAD:STAN:PRES:ULIN:ACH NR</code> <code>:RAD:STAN:PRES:ULIN:ACH?</code>
Preset	NR
State Saved	Yes
Range	NR (same BW) UTRA NR + UTRA

UE Power Class

This control is part of the “Preset for ACP, Mod Analysis” section of the Advanced Preset Parameters dialog. It lets you select the UE Power Class for preset from Power Class 1 to 4.

Set the value you want for this control and the other controls in the “Configure Preset” section, and then press “Apply Preset (to all CCs)”.

NOTE

You must press **Apply Preset (to all CCs) or the value on this controls will *not* affect the Component Carriers.**

This parameter is valid for the ACP and Mod Analysis measurement.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:ULINK:PCLass CLASS1 ... CLASS4</code> <code>[:SENSe]:RADio:STANdard:PRESet:ULINK:PCLass?</code>

More Advanced Preset Parameters

Enables you to configure more advanced Apply Preset features.

Include RB Alloc Preset for Mod Analysis

Enables you to select whether or not RB Alloc Preset is preset when Apply Preset is executed.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:INCLude:EVM:RBALloc OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:INCLude:EVM:RBALloc?</code>
Example	<code>:RAD:STAN:PRES:INCL:EVM:RBAL 1</code> <code>:RAD:STAN:PRES:INCL:EVM:RBAL?</code>
Notes	When Exclude is selected, the indicator “Exclude EVM RB Alloc” appears on the Meas Setup menu panel
Preset	ON
State Saved	Yes

Include Gate Source

Enables you to select whether or not Gate Source is preset when Apply Preset is executed.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:INCLude:EGATe:SOURce OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:INCLude:EGATe:SOURce?</code>
Example	<code>:RAD:STAN:PRES:INCL:EGAT:SOUR 1</code> <code>:RAD:STAN:PRES:INCL:EGAT:SOUR?</code>
Preset	ON
State Saved	Yes

Include Periodic Timer Period

Enables you to select whether or not Periodic Timer Period is preset when Apply Preset is executed.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:PERiod OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:PERiod?</code>
Example	<code>:RAD:STAN:PRES:INCL:FRAM:PER 1</code> <code>:RAD:STAN:PRES:INCL:FRAM:PER?</code>
Preset	ON
State Saved	Yes

Include Periodic Timer Sync Source

Enables you to select whether or not Periodic Timer Sync Source is preset when Apply Preset is executed.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:SYNC[:SOURce] OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:SYNC[:SOURce]?</code>
Example	<code>:RAD:STAN:PRES:INCL:FRAM:SYNC 1</code> <code>:RAD:STAN:PRES:INCL:FRAM:SYNC?</code>
Preset	ON
State Saved	Yes

Include Periodic Timer Sync Holdoff

Enables you to select whether or not Periodic Timer Sync Holdoff is preset when Apply Preset is executed.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:SYNC:HOLDoff OFF ON 0 1</code> <code>[:SENSe]:RADio:STANdard:PRESet:INCLude:FRAMe:SYNC:HOLDoff?</code>
Example	<code>:RAD:STAN:PRESet:INCL:FRAM:SYNC:HOLD 1</code> <code>:RAD:STAN:PRESet:INCL:FRAM:SYNC:HOLD?</code>
Preset	ON
State Saved	Yes

Apply Preset (to All CCs)

This is the same as the Apply Preset (to All CCs) control on the Meas Standard menu panel tab under Meas Standard.

See ["Apply Preset \(to All CCs\)" on page 2657](#).

Apply Preset (to All CCs)

When you press this control, parameters of each component carrier are configured to the values set on the ["Bandwidth" on page 2643](#), ["Frequency Range" on page 2644](#), ["Duplex Mode" on page 2644](#), ["SCS" on page 2645](#) and ["RB Alloc Preset" on page 2646](#) controls in the "Configure Presets" section of the menu panel. These values will also be used for any subsequent Component Carriers created.

NOTE

You must press **"Apply Preset (to all CCs)"** or the values on the controls in the "Configure Presets" section of the menu panel will *not* affect the Component Carriers.

Remote Command	<code>[:SENSe]:RADio:STANdard:PRESet:IMMEDIATE</code>
Example	<code>:RAD:STAN:PRESet:IMM</code>
Notes	Whenever any preset parameter is changed, including the following cases, the color of this control changes to amber, until "Apply Preset" is executed again <ul style="list-style-type: none"> - Start-up - Mode Preset - Recall

Values for Meas Standard

Meas Standard Setting Parameters for Apply Preset

The following parameters in Meas Setup > Meas Standard let you configure the preset values for Component Carriers.

Direction	Downlink	Uplink
Bandwidth	5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80, 90, 100, 200, 400, 800, 1600, 2000 MHz	5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80, 90, 100, 200, 400, 800, 1600, 2000 MHz
Frequency Range	FR1 FR2	FR1 FR2
Duplex Mode	FDD TDD	FDD TDD
SCS	$\mu = 0$ (15 kHz), 1(30 kHz), 2 (60 kHz), 3 (120 kHz), 5 (480 kHz), 6 (960 kHz)	$\mu = 0$ (15 kHz), 1(30 kHz), 2 (60 kHz), 3 (120 kHz), 5 (480 kHz), 6 (960 kHz)
RB Alloc Preset	Fulfilled QPSK, Fulfilled 16 QAM, Fulfilled 64 QAM, Fulfilled 256 QAM, 1024 QAM NR-TM1.1 (port 0), 1.1 (port 1), 1.1 (2 layers),1.2, 2 (64 QAM/16 QAM/QPSK), 2a, 2b, 3.1 (64 QAM/16 QAM/QPSK), 3.1a, 3.1b, 3.2, 3.3	Fulfilled Pi/2-BPSK (for DFT-s-OFDM only), Fulfilled QPSK, Fulfilled 16 QAM, Fulfilled 64 QAM, Fulfilled 256 QAM
UL Carrier Mode	n/a	Normal Uplink, Sidelink-V2X
OFDM Type (for Mod Analysis)	CP-OFDM	CP-OFDM, DFT-s-OFDM
Adjust Limit Mask for Freq Range (for ACP, SEM, PvT and Spur only)	None, $f \leq 1.0$ GHz (FR1), $1.0 < f \leq 3.0$ GHz (FR1), $3.0 < f \leq 4.2$ GHz (FR1), $4.2 < f \leq 6.0$ GHz (FR1), $6.0 < f \leq 7.125$ GHz (FR1), $24.25 < f \leq 29.5$ GHz (FR2), $37.0 < f \leq 43.5$ GHz (FR2), $43.5 < f \leq 48.2$ GHz (FR2), $52.6 < f \leq 71.0$ GHz (FR2)	None, $f \leq 1.0$ GHz (FR1), $1.0 < f \leq 3.0$ GHz (FR1), $3.0 < f \leq 4.2$ GHz (FR1), $4.2 < f \leq 6.0$ GHz (FR1), $6.0 < f \leq 7.125$ GHz (FR1), $24.25 < f \leq 29.5$ GHz (FR2), $37.0 < f \leq 43.5$ GHz (FR2), $43.5 < f \leq 48.2$ GHz (FR2), $52.6 < f \leq 71.0$ GHz (FR2)
BS Type (for ACP, SEM, PvT and Spur only)	1-C (FR1 Conducted), 1-O (FR1 Radiated), 2-O (FR2 Radiated)	n/a
BS Category (for ACP, SEM, PvT, and Spur only)	Cat A Wide Area BS, Cat B Wide Area BS, Cat A Medium Range BS,	n/a

	Cat B Medium Range BS, Cat A Medium Range BS (Low Pr), Cat B Medium Range BS (Low Pr), Cat A Local Area BS, Cat B Local Area BS	
Assumed Adj Channels (for ACP, FR1)	NR (same BW), E-UTRA, NR + E-UTRA	NR (same BW), UTRA, NR+UTRA
UE Power Class (for ACP: FR1 and Mod Analysis: FR2 UE IBE)	n/a	When Freq Range is FR1: Power Class 2, Power Class 3 When Freq Range is FR2: Power Class 1, Power Class 2, Power Class 3, Power Class 4
UL Channel Type (for Tx On Off Power)	n/a	When Freq Range is FR1: PUSCH, PRACH Config Index 4 (FDD), PRACH Config Index 160 (15 kHz SCS, FDD), PRACH Config Index 160 (30 kHz SCS, FDD), PRACH Config Index 12 (TDD), PRACH Config Index 123 (15 kHz SCS, TDD), PRACH Config Index 123 (30 kHz SCS, TDD), SRS When Freq Range is FR2: PUSCH, PRACH Config Index 0 (60 kHz SCS), PRACH Config Index 0 (120 kHz SCS), SRS

TS38.521-2 v.17.0.0 (v.2022-09) The following PvT limit requirements are still FFS:

Clause 6.3.3.2, Table 6.3.3.2.5-3: Test Tolerance for OFF power ... still FFS.

Clause 6.3.3.2, Table 6.3.3.2.5-4: Test Tolerance for ON power ... still FFS.

Clause 6.3.3.4, Table 6.3.3.4.5-1: PRACH time mask ... for On power and On power Tolerance ... still FFS.

Clause 6.3.3.6 SRS time mask ... still all FFS.

When "Apply Preset (to All CCs)" on page 2657 is pressed, related measurement parameters and Gate parameters are changed to the values described in the following sections in this chapter.

Reference Standard version and ACP & SEM table indicator

The following reference 3GPP test spec doc with its version number, ACP and SEM table numbers are displayed in the **Advanced Preset Parameters** dialog menu.

e.g.)

3GPP TS38.141-1 v.17.7.0 (2022-09)

ACP reference table selection represents the Relative Limit for Outer Offsets. (The table numbers for Absolute limits, Test Tolerances, and the limits for Inner Offsets/CACLR are not displayed.)

Direction = Uplink

When UL Carrier Mode = Normal Uplink:

Preset parameters	Reference spec doc, ACP and SEM table in the menu
FR Assumed Adjacent Channel (ACLR)	Test Spec ACP (*) SEM
FR1 NR (same BW) UTRA, NR + UTRA	TS38.521-1 v.17.6.1 (2022-10) Table 6.5.2.4.1.5-2 Table 6.5.2.4.2.5-2
FR2	TS38.521-2 v.17.0.0 (2022-09) Table 6.5.2.3.5-1 Table 6.5.2.1.5-1

When UL Carrier Mode = Sidelink / V2X:

Preset parameters	Reference spec doc, ACP and SEM table in the menu
FR Assumed Adjacent Channel (ACLR)	Test Spec ACP (*) SEM
FR1 NR (same BW)	TS38.521-1 v.17.6.1 (2022-10) Table 6.5E.2.4.1.5-2 Table 6.5E.2.2.1.5-1

(*) ACP reference table selection represents the Relative Limit for Outer Offsets. (The table numbers for Absolute limits, Test Tolerances, and the limits for Inner Offsets/CACLR are not displayed.)

Measurement-Global parameters

The following parameters are configured as preset values.

- "Configure Component Carriers" on page 2664
- "Trigger/Gate Parameters" on page 2664

Configure Component Carriers

When Direction = Uplink:

Preset Configuration	Preset Value
UL Carrier Mode	Sidelink
Normal Uplink	Disabled (for all CCs)
Sidelink / V2X	Enabled (for all CCs)

Trigger/Gate Parameters

When executing "Apply Preset", preset the following parameters:

Trigger menu	Parameter	Preset values		
		Downlink (*1) FR1	Downlink (*1) FR2	Uplink
Trigger	Select Trigger Source (*2)	(no preset)	(no preset)	(no preset)
	Period (Periodic Timer) (*3)	5.000 ms	1.250 ms	10.000 ms
	(Periodic) Sync Source (*4)	RF Burst	RF Burst	RF Burst
Gate Source	Select Gate Source	Periodic	Periodic	Periodic
	Period (Periodic Timer) (*3)	5.000 ms	1.250 ms	10.000 ms
	(Periodic) Sync Source (*4)	RF Burst	RF Burst	RF Burst
	Sync Holdoff	On, 250 us	On, 250 us	On, 250 us
Gate Settings	Gate (*5)	On	On	(no preset)
	Gate Delay	5.000 ms	1.250 ms	(no preset)
	Gate Length	3.700 ms (*6) or 2.700 ms (*6)	927.5 us	(no preset)
	Gate Holdoff	(no preset)	(no preset)	(no preset)
	Periodic Sync Src	Select Periodic Trigger Sync Source (*4)	RF Burst	RF Burst
Auto Holdoff	Absolute Trig Level	(no preset)	(no preset)	(no preset)
	Trigger Slope	(no preset)	(no preset)	Positive
	Trig Holdoff	(no preset)	(no preset)	On, 250 us (*7)
	Holdoff Type	(no preset)	(no preset)	Below (*7)

Notes:

(*1) For Downlink case, these values are preset with the Apply Preset action when "RB Alloc Preset" on page 2646 is any of NR-TM and "Duplex Mode" on page 2644 is TDD.

(*2) Trigger Source is a separate parameter in each measurement, and is not preset with the Apply Preset action. Note that in the Tx On/Off Power measurement, it is forcefully changed to Periodic when the direction is switched to Uplink or to External 1 when the direction is switched to Downlink except for models with the H1G option. With the H1G option, it is changed to either External 1 (when Info BW \leq 255 MHz) or External 3 (when Info BW \geq 256 MHz) depending on the Info BW determined by the component carrier configuration.

(*3) Periodic Trigger Period and Gate Period are the same/shared parameter, so called "Periodic Timer Period".

(*4) Periodic Trigger Sync Source and Periodic Gate Sync Source are the same/shared parameter.

(*5) Gate is preset to Off with the Apply Preset action when "Duplex Mode" on page 2644 is FDD.

(*6) Gate Length preset value for DL FR1 depends on "DL FR1 NR-TM Reference Standard Selection" on page 2357 under the Advanced Preset Parameters menu: 3.700 ms for TS38.141-1 or 2.700 ms for TS37.141 BC3 CS16/17.

(*7) These Trig Holdoff & Holdoff Type settings make the trigger holdoff wait for an OFF power period at least 250 us (in any burst configuration preset in Uplink), and then triggers at the beginning of the power raise timing (with Trigger Slope = Positive) of the Burst ON power as expected. This is to avoid an unexpected triggering with other random power up or down.

3.12.8.5 Meas Standard

Contains controls that allow you to preset the PowerSuite measurements to conform to various communications standards.

Radio Standard Presets

Allows you to specify the Radio Standard to be used. Spectrum Analyzer Mode supports many Radio Standards. You can select the desired Radio Standard using the **Radio Std Presets** dialog, which displays a cascading list of standards. When you have the selected the desired standard, press **OK** and the measurement settings will change to reflect that standard.

Remote Command [:SENSe]:RADio:STANdard[:SElect] NONE | JSTD | IS95a | IS97D | IS98D | GSM | W3GPP | C2000MC1 | C20001X | NADC | PDC | BLUEtooth | TETRa | WL802DOT11A | WL802DOT11B | WL802DOT11G | HIPERLAN2 | DVBTLSN | DVBTGPN | DVBTIPN | FCC15 | SDMBSE | UWBINDOOR | LTEB1M4 | LTEB3M | LTEB5M | LTEB10M | LTEB15M | LTEB20M | WL11N20M | WL11N40M | WL11AC20M | WL11AC40M | WL11AC80M | WL11AC160M | WL11AD2G | WL11AY2G16 | WL11AY4G32 | WL11AY6G48 | WL11AY8G64 | NR5GFR1B100M

[:SENSe]:RADio:STANdard[:SElect]?

3 5G NR Mode
3.12 Phase and Amplitude vs Time Measurement

Example	<code>:RAD:STAN NONE</code> <code>:RAD:STAN?</code>
Dependencies	Some selections appear only when support license is valid
Couplings	By changing the radio standard, the measurement parameters will be automatically set to an appropriate default value
State Saved	Saved in instrument state

The **Radio** column in the table allows you to specify the device to be used. It is a global setting that affects the Device selection, between Mobile (MS) and Base Station (BTS) settings, for all relevant Power Suite measurements. The Device SCPI command has the same effect as a selection in the “Radio” column:

Remote Command	<code>[:SENSe]:RADio:STANdard:DEVIce BTS MS</code> <code>[:SENSe]:RADio:STANdard:DEVIce?</code>
Example	<code>:RAD:STAN:DEV MS</code> <code>:RAD:STAN:DEV?</code>
Preset	<code>BTS</code>
State Saved	Saved in instrument state
Range	<code>BTS MS</code>

Chart for Standard and Available Measurements

Note that not every measurement in Spectrum Analyzer Mode is available for every standard. The chart below describes which measurements are available for each Radio Standard. Note that *no* Radio Standards are available for TOI or Harmonics measurements.

General Radio Standards

The table below lists the settings and provides an example for each general Radio Standard.

None	Command Example	:RAD:STAN NONE
	IBW	2 MHz
	Span	3 MHz
	RBW	Auto rules
	VBW	Auto rules

3 5G NR Mode
 3.12 Phase and Amplitude vs Time Measurement

TETRA	Command Example	<code>:RAD:STAN TETR</code>
	IBW	18 kHz
	Span	27 kHz
	RBW	1.2 kHz
	VBW	Auto rules
	RRC Filter	On
	RRC Filter Alpha	0.35
FCC Part15 Subpart F	Command Example	<code>:RAD:STAN FCC15</code>

Video Radio Standards

The table below lists the settings and provides an example for each video Radio Standard.

DVB-T L/SECAM/NICAM	Command Example	<code>:RAD:STAN DVBTLSN</code>
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T G/PAL/NICAM	Command Example	<code>:RAD:STAN DVBTGPN</code>
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T I/PAL/NICAM	Command Example	<code>:RAD:STAN DVBTIPN</code>
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
S-DMB System E	Command Example	<code>:RAD:STAN SDMBSE</code>
	IBW	25 MHz
	Span	37.5 MHz
	RBW	360 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

Cellular Radio Standards

The table below lists the CHP settings and provides an example for each cellular Radio Standard.

GSM/EDGE	Command Example	<code>:RAD:STAN GSM</code>
3GPP W-CDMA	Command Example	<code>:RAD:STAN W3GPP</code>
	IBW	5 MHz
	Span	7.5 MHz
	RBW	240 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22
3GPP LTE 1.4 MHz	Command Example	<code>:RAD:STAN LTEB1M4</code>
	IBW	1.4 MHz
	Span	2.1 MHz
	RBW	Auto rules

Each Radio Standard has the preset parameter set for the measurement.

When a standard is selected, the default value of the measurement parameters are overwritten by those preset values.

When the standard is **NONE**, or the standard does not specify the firm RBW requirement, then the table displays “auto”, and the following definition is used to compute the proper RBW setting:

1. Compute the guard-band = $[\text{Offset Freq A}] - 0.5 * ([\text{Chan Integ BW}] + [\text{Ref BW}])$
2. Divide by 4.5. Call the result GuardbandGoalRBW
3. Compute the greater of the Reference and Offset A integration bandwidths. Divide that result by 100 and call it the ChannelWidthGoalRBW
4. Find the smallest integration bandwidth of any of the offsets; divide it by two and call the result IntegBWGoalRBW
5. Compute $\text{AutoRBWGoal} = \min(\text{IntegBWGoal}, \max(\text{GuardbandGoalRBW}, \text{ChannelWidthGoalRBW}))$
6. Compute the RBW to be selected to be the largest available RBW that is smaller than AutoRBWGoal

Measurements that are unavailable for a particular Radio Standard are grayed-out. Radio Standards that are unavailable for the current active measurement are also grayed-out.

However, remote operations, such as **:CONF** allow the measurement to be active even if it is not a supported format. In this case, the measurement configuration should be set to **NONE**.

Enable Non-Std Meas

Allows you to specify whether all measurements and radio standards are enabled or not.

By default, **Enable Non-Std Measurements** is set to **NO**, so you can select only valid combinations of preset available standards and measurements. Combinations of measurement and standard that would have no valid preset value are grayed-out.

When **Enable Non-Std Measurements** is set to **YES**, all measurements and standard selections are enabled, so you can select any combination.

NOTE

If you select an unavailable measurement or unavailable radio standard using the **Enable Non-Std Meas** control, the measurement results may not conform to the selected standard.

Remote Command	<code>[:SENSe]:RADio:STANdard:EAMeas YES NO</code> <code>[:SENSe]:RADio:STANdard:EAMeas?</code>
Example	<code>:RAD:STAN:EAM YES</code> <code>:RAD:STAN:EAM?</code>
Preset	NO
State Saved	Saved in instrument state
Range	YES NO

3.12.8.6 Advanced

Contains controls for setting advanced functions of the instrument.

IF Gain

Sets the IF Gain function to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

Remote Command	<code>[:SENSe]:PAVTime:IF:GAIN[:STATe] ON OFF 1 0</code> <code>[:SENSe]:PAVTime:IF:GAIN[:STATe]?</code>
----------------	--

	<code>[:SENSe]:PAVTime:IF:GAIN:AUTO[:STATe] ON OFF 1 0</code> <code>[:SENSe]:PAVTime:IF:GAIN:AUTO[:STATe]?</code>
Example	<code>:PAVT:IF:GAIN ON</code> <code>:PAVT:IF:GAIN?</code> <code>:PAVT:IF:GAIN:AUTO ON</code> <code>:PAVT:IF:GAIN:AUTO?</code>
Notes	ON = high gain OFF = low gain
Dependencies	The IF Gain controls (FFT IF Gain and Swept IF Gain) have no effect when the U7227A USB Preamp-lifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both FFT IF Gain and Swept IF Gain are set to Low regardless of the setting on the controls This control is not available in VXT models SP900B/21A, EXM, or UXM This control is not available in the E7760, M9393A or M9391A
Preset	OFF OFF
State Saved	Saved in instrument state
Range	Low Gain High Gain

3.12.8.7 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, **Global Center Freq**) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global Settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Freq** will remain unchanged.

Adjusting the Center Freq of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the Center Freq of the current Mode is unchanged, but now the Center Freq of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset Center Freq of the current Mode.

This function is reset to **OFF** when "**Restore Defaults**" on page 2680 (in this tab) is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:FREQuency:CENTer ALL NONE</code> <code>:INSTRument:COUPlE:FREQuency:CENTer?</code>
Example	<code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code>
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	<code>:GLOBal:FREQuency:CENTer[:STATe] 1 0 ON OFF</code> <code>:GLOBal:FREQuency:CENTer[:STATe]?</code>

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the Global EMC Std, so you can switch between any of these Modes and the EMC Std will remain unchanged.

Adjusting the EMC Std of any Mode that supports Global Settings, while Global EMC Std is **ON**, will modify the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode is unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, the Global EMC Std is preset to the preset EMC Std of the current Mode.

This function is reset to **OFF** when "**Restore Defaults**" on page 2680 (in this tab) is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:EMC:STANdard ALL NONE</code> <code>:INSTRument:COUPlE:EMC:STANdard?</code>
Example	<code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code>
Dependencies	Only available if option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned **ON**, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function is reset to **OFF** when "**Restore Defaults**" on page 2680 (in this tab) is pressed, or when **System, Restore Defaults, All Modes** is pressed.

This parameter is available for SA, RTSA, WCDMA, LTEAFDD, and LTEATDD Modes.

Remote Command	<code>:INSTRUMENT:COUPLE:FREQUENCY:BAND:EXTend 0 1 ON OFF</code> <code>:INSTRUMENT:COUPLE:FREQUENCY:BAND:EXTend?</code>
Example	<code>:INST:COUP:FREQ:BAND:EXT 1</code> <code>:INST:COUP:FREQ:BAND:EXT?</code>
Dependencies	Only applies to UXA, PXA, MXA and EXA
Preset	Set to OFF by Global Settings > Restore Defaults and System > Restore Defaults > All Modes
Range	ON OFF

Restore Defaults

Resets all the functions in the **Global > Settings** menu to **OFF**. This also occurs when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRUMENT:COUPLE:DEFAULT</code>
Example	<code>:INST:COUP:DEF</code>
Backwards Compatibility SCPI	<code>:GLOBAL:DEFAULT</code>

3.12.9 Sweep

Contains controls that allow you to control the sweep and measurement functions of the instrument.

3.12.9.1 Sweep/Control

Accesses controls that enable you to operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Allows you to toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See ["More Information" on page 2682](#)

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, there is no Cont hardkey, instead there is a Sweep Single/Cont softkey. In these instruments, switching the Sweep Single/Cont softkey from Single to Cont restarts averages (displayed average count reset to 1), but does not restart Max Hold and Min Hold X-Series A-models have Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switches to continuous measurement, but never restarts a measurement and never resets a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep For Spectrum Analysis Mode in ESA and PSA, the Single hardkey and the <code>INITiate:IMM</code> switched from continuous measurement to single measurement and restarted sweeps and averages (displayed

average count reset to 1), but did not restart **Max Hold** and **Min Hold**. In the X-Series, the **Restart** control and the **INITiate:IMM** command initiate a sweep/ measurement/ average sequence/hold sequence including **MaxHold** and **MinHold**

For Spectrum Analysis Mode in ESA and PSA, the **Single** hardkey restarted the sweep regardless of whether or not you were in an active sweep or sweep sequence. In the X-Series, **Restart** does this

More Information

Continuous Mode	<p>The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num, the count stops incrementing, but the instrument keeps sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>
Single Mode	<p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If it is already in continuous sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See the "**Restart**" on page 2683 control description for details of **:INIT:IMMEDIATE**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending **:INIT:IMM** does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step Up** key while **Average/Hold Num** is the active function. You can also do this by sending **:CALC:AVER:TCON UP**.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending **:INIT:IMM**
- Sending **:INIT:REST**

See "[More Information](#)" on page 2684

Remote Command	:INITiate[:IMMediate] :INITiate:REStart
Example	:INIT:IMM :INIT:REST
Notes	:INIT:REST and :INIT:IMM perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The STATus:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATus:QUESTionable register bit 9 (INTegrity sum) is cleared The SWEEPING bit is set The MEASURING bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restart trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average , but MaxHold and MinHold traces as well

For wireless comms modes in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restart every measurement, which includes all traces and numeric results. There is no change to this operation

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support Pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORt</code>
Example	<code>:ABOR</code>
Notes	If <code>:INIT:CONT</code> is ON , then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If <code>:INIT:CONT</code> is OFF , then <code>:INIT:IMM</code> is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, <code>:ABORt</code> is equivalent to the Restart key Not all measurements support this command
Status Bits/OPC dependencies	The <code>STATus:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATus:QUESTionable</code> register bit 9 (INTEgrity sum) is cleared Since all the bits that feed into OPC are cleared by <code>:ABORt</code> , the Abort command will cause the <code>*OPC</code> query to return true

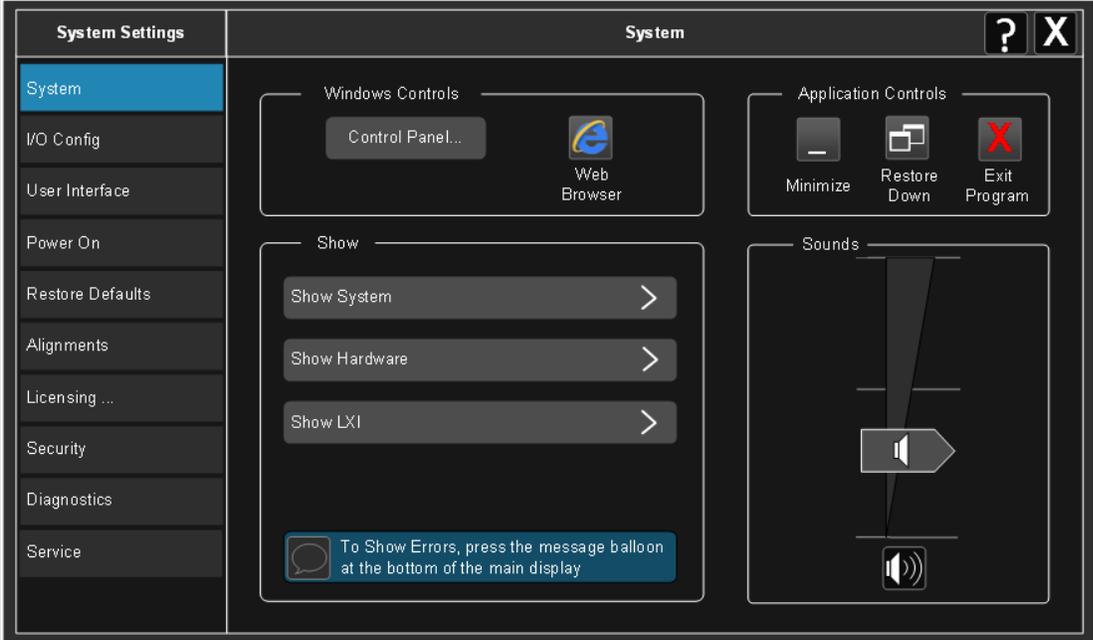

3.12.10 Trace

Trace functionality is not supported in the Phase and Amplitude vs Time measurement.

4 System

The **System** hardkey and the “gear” icon both open the **System Settings** dialog, which allows you to access various configuration menus and dialogs. The line of tabs down the left side let you choose various pages for configuring your instrument.

Notes No remote command for this key specifically

4.1 System

Allows access to several general system functions, including three **Show** screens for viewing system parameters. Several such **Show** screens are available on this and other **System** menu pages. They can also be accessed with the SCPI command described here.

Remote Command	<code>:SYSTem:SHOW OFF ERRor SYSTem HARDware LXI HWStatistcs ALIGNment SOFTware CAPPLication</code> <code>:SYSTem:SHOW?</code>
Example	<code>:SYST:SHOW SYST</code>
Notes	Displays (or exits) the System information screens
Preset	OFF
State Saved	No
Range	OFF ERRor SYSTem HARDware LXI HWStatistcs ALIGNment SOFTware CAPPLication

4.1.1 Show System

This screen is divided into three groups: product descriptive information, options tied to the hardware, and software products. Swipe up and down on this screen to scroll the display.

System Settings	< System	Show System	? X
System	Keysight Technologies	Keysight UXA	Keysight UXA Signal Analyzer
I/O Config	Product Number	Serial Number	N9040B US00091133
User Interface	Instrument S/W Revision	Revision Date	A.15.00_P0053 11/17/2014 11:37:12 AM
Power On	Computer System	Computer Name	Windows 7 , Service Pack 1 A-N9040B-91133
Restore Defaults	IP Address	IPv6 Address	141.121.151.83 2002:8d79:9753::8d79:9753
Alignments	Link-Local IPv6 Address	Host ID	fe80::46e:1db5:7286:68ac%3 N9040B,US00091133
Licensing ...	mDNS Enabled	mDNS Host Name	Yes A-N9040B-91133
Security	mDNS Service Name	Keysight N9040B Signal Analyzer - US00091133	
Diagnostics	Option	Name / Description	
Service	N9040B-PC6	Intel(R) Core(TM) i7-3615QE CPU @ 2.30GHz, 16 GB	
	N9040B-SSD	INTEL SSDSC2BB080G4 ATA DEVICE	
	N9040B-W7X	Windows Embedded Standard 7, 64 bit OS	

Example `:SYST:SHOW SYST`

4.1.1.1 Show System contents (Remote Command Only)

Returns the contents of the **Show System** screen (the entire contents, not just the currently displayed page).

Remote Command `:SYSTem:CONFigure[:SYSTem]?`

Example `:SYST:CONF?`

Notes The output is an IEEE Block format of the **Show System** contents. Each line is separated by a new-line character

4.1.1.2 Computer System description (Remote Command Only)

Returns the **Computer System** description, which consists of the operating system and patch level, as reported by operating system.

Remote Command `:SYSTem:CSYStem?`

Example `:SYST:CSYS?`

Notes Returns the Computer System name and service pack level

4.1.2 Show Hardware

Displays details of the installed hardware. This information can be used to determine versions of hardware assemblies and field-programmable devices, in the advent of future upgrades or potential repair needs.

The screen is divided into two groups: product descriptive information and hardware information. The hardware information is listed in a table format.

Example `:SYST:SHOW HARD`

4.1.3 Show LXI

Displays the product number, serial number, firmware revision, computer name, IP address, Host ID, LXI Class, LXI Version, MAC Address, and the Auto-MDIX Capability.

Example `:SYST:SHOW LXI`

4.1.4 Show Support Subscriptions

Displays the software support subscription information for the licenses available on the instrument.

Shows the software license, description, software support expiration date (format is **YYYY.MMDD**), and the software support status. The **Software Version Date** (format is **YYYY.MMDD**) shown in the header indicates the date required to access the latest software enhancements included in this version of the software. If any license has a **Software Support Expiration Date** earlier than the **Software Version Date**, then enhancements may be available that the license does *not* enable.

System Settings	Support Subscriptions		
System	Keysight PXA	Keysight PXA Signal Analyzer	
	Product Number	N9030A	
	Instrument S/W Revision	A.20.10

Example `:SYST:SHOW SSINformation`

4.1.5 Show Support ID

Displays the Support ID for each license available in the instrument. Shows the **Software License**, **Description**, software support expiration date, and **Support ID** for that license.

Each license has a copy icon, which copies just the **Support ID** for that license to the Windows clipboard. This is useful to avoid typing mistakes when entering this value into another program or web site.

The **Copy all to clipboard ...** control copies all the data to the Windows clipboard, in comma-separated value (CSV) format.

System Settings	System	Support ID
System	Keysight PXA	Keysight PXA Signal Analyzer
	Product Number	N9030A

Example `:SYST:SHOW SID`

4.1.6 Control Panel...

Opens the Windows Control Panel. **Control Panel** is used to configure certain elements of Windows that are not configured via the Multitouch UI System menus.

NOTE This feature is *not* available if Option SF1 is installed.

Control Panel is a separate Windows application, so to return to the Instrument Application, either:

- Exit by tapping on the red **X** in the upper right-hand corner
- Use **Alt+Tab**. Press and hold the **Alt** key and press and release the **Tab** key until the Instrument logo is showing in the window in the center of the screen, then release the **Alt** key

Notes No remote command for this key

4.1.7 Web Browser

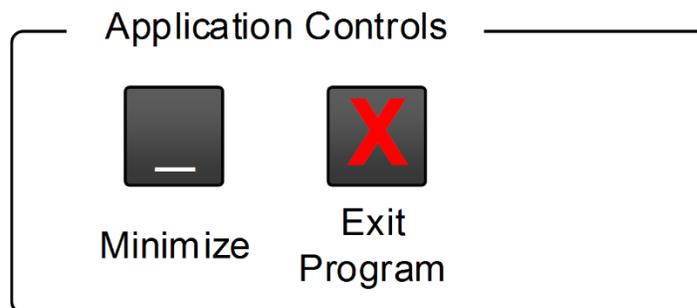

Launches the instrument's default **Web Browser**. Usually, the default is Microsoft Edge. A mouse and external keyboard are highly desirable for using the browser. To return focus to the Instrument Application, close the browser (or use **Alt-Tab**).

NOTE

This feature is *not* available if Option SF1 is installed.

4.1.8 Application Controls

Lets you Minimize or Exit the application.

Pressing **Exit Program** displays a prompt asking if you are sure you want to close the program. If you select **OK**, the entire analyzer application will shut down, and you will lose any unsaved trace or measurement data.

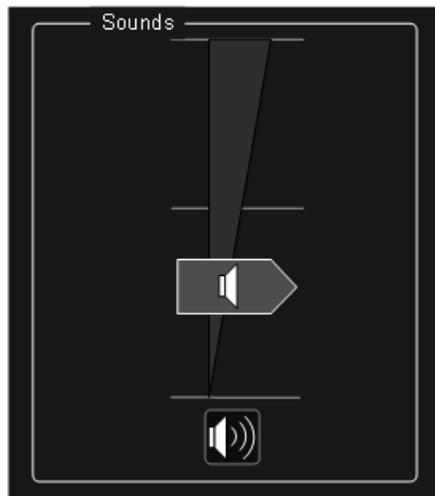

Notes

No equivalent remote command for this key

4.1.9 Sounds

Lets you adjust the speaker volume using the slider, or mute/unmute the speaker, by tapping the **Speaker** icon.

Moving the slider up and down changes the speaker volume, and *also* unmutes the speaker if muted.

Icon when muted

4.2 I/O Config

Allows you to specify and change the I/O configuration for remote control. Controls in this menu allow configuration of the I/O ports used for SCPI remote control over GPIB and LAN.

The SCPI LAN parameters are set using controls in this menu, but configuration of LAN settings themselves is performed using the Windows Control Panel (DHCP, Gateway, Subnet Mask, etc.).

The USB port is also available for remote control, but requires no configuration.

4.2.1 GPIB

Allows you to configure the GPIB I/O port.

Dependencies	Not available in UXM
--------------	----------------------

4.2.1.1 GPIB Address

Select the GPIB remote address.

Remote Command	<code>:SYSTem:COMMunicate:GPIB[1][:SELF]:ADDRess <integer></code>
	<code>:SYSTem:COMMunicate:GPIB[1][:SELF]:ADDRess?</code>
Example	<code>:SYST:COMM:GPIB:ADDR 17</code>
Notes	If the GPIB port address is changed, all further communication must use the <i>new</i> address
Preset	Unaffected by Preset , but set to 18 by Restore System Defaults->Misc
State Saved	No
Min	0
Max	30

4.2.1.2 GPIB Controller

Sets the GPIB port into Controller (**ON**) or Device (**OFF**) mode. In the normal state, **GPIB Controller** is disabled (**OFF**), which allows the instrument to be controlled by a remote computer. When **GPIB Controller** is enabled (**ON**), the instrument can run software applications that use the instrument's computer as a GPIB controller for devices connected to the GPIB port.

NOTE

When **GPIB Controller** is enabled, the analyzer application itself cannot be controlled over GPIB. In this case, it can be controlled via LAN or USB. The GPIB port cannot be a Controller and Device at the same time. Only one Controller can be active on the GPIB bus at any given time. If the instrument is the Controller, an external PC cannot also be a Controller.

To control the instrument from the software that is performing GPIB Controller operation, you can use an internal TCP/IP connection to the analyzer application. Use the following IP Address to send commands to the analyzer application:

```
TCPIP0:localhost:inst0:INSTR
```

Remote Command	<code>:SYSTem:COMMunicate:GPIB[1][:SELF]:CONTroller[:ENABLE] ON OFF 0 1</code> <code>:SYSTem:COMMunicate:GPIB[1][:SELF]:CONTroller[:ENABLE]?</code>
Example	<code>:SYST:COMM:GPIB:CONT ON</code> Sets GPIB port to Controller <code>:SYST:COMM:GPIB:CONT OFF</code> Sets GPIB port to Device
Notes	When the instrument becomes the Controller, Bit 0 in the Standard Event Status Register is set. When the instrument relinquishes Controller capability, bit 0 is cleared
Preset	Unaffected by Preset, but set to OFF (Disabled) by Restore System Defaults->Misc
State Saved	No
Range	Disabled Enabled

4.2.2 SCPI LAN

Displays a menu for identifying and changing SCPI over a LAN configuration. There are several ways to send SCPI remote commands to the instrument over LAN.

Having multiple users simultaneously accessing the instrument over the LAN may lead to communication problems. These controls can help to prevent that, by disabling the telnet, socket, and/or SICL capability.

NOTE

When multiple instances of the application are running, Telnet port 5023, socket port 5025, SICL server inst0 and HiSLIP server Device 0 will be assigned to the first instance; Telnet port 5123, socket port 5125, SICL server inst1 and HiSLIP server Device 1 will be assigned to the second instance; Telnet port 5223, socket port 5225, SICL server inst2 and HiSLIP server Device 2 will be assigned to the third instance; Telnet port 5323, socket port 5325, SICL server inst3 and HiSLIP server Device 3 will be assigned to the fourth instance.

- "SCPI Telnet" on page 2696
- "SCPI Socket" on page 2696
- "SICL Server" on page 2697
- "HiSLIP Server" on page 2698
- "Verbose SCPI On/Off" on page 2698
- "SCPI Socket Control Port (Remote Query Only)" on page 2700

4.2.2.1 SCPI Telnet

Turns SCPI LAN telnet capability On or Off, allowing you to limit SCPI access over LAN through telnet.

Remote Command	<code>:SYSTem:COMMunicate:LAN:SCPI:TELNet:ENABle OFF ON 0 1</code> <code>:SYSTem:COMMunicate:LAN:SCPI:TELNet:ENABle?</code>
Example	<code>:SYST:COMM:LAN:SCPI:TELN:ENAB OFF</code>
Preset	Unaffected by Preset , but set to ON by Restore System Defaults->Misc If not set up or specified, the Secure Instrument Communications configuration setting: is ON
State Saved	No
Range	OFF ON

4.2.2.2 SCPI Socket

Turns the capability to establish Socket LAN sessions **ON** or **OFF**, to limit SCPI access over LAN through socket sessions.

Connection String & Copy Button

In "SCPI LAN" on page 2695, the full SCPI connection string is displayed to the right of the **SCPI Socket ON/OFF** control. Pressing **Copy**, to the right of the string, copies the connection string to the Windows clipboard.

Remote Command	<code>:SYSTem:COMMunicate:LAN:SCPI:SOCKet:ENABle OFF ON 0 1</code> <code>:SYSTem:COMMunicate:LAN:SCPI:SOCKet:ENABle?</code>
Example	<code>:SYST:COMM:LAN:SCPI:SOCK:ENAB OFF</code>
Dependencies	If the Secure Instrument Communications configuration has disabled this connection, local changes are not allowed, and an attempt to do so results in error -221, "Disabled by Secure Instrument Communications configuration"

Preset	Unaffected by Preset , but set to ON by Restore System Defaults->Misc If not set up or specified, the Secure Instrument Communications configuration setting: is ON
State Saved	No
Range	OFF ON

4.2.2.3 SICL Server

Turns the **SICL Server** capability **ON** or **OFF**, to limit SCPI access over LAN through the SICL server. (SICL IEEE 488.2 protocol.)

Parameter	Description	Setting
Maximum Connections	The maximum number of connections that can be accessed simultaneously	5
Instrument Name	The name (same as the remote SICL address) of your instrument	inst0
Instrument Logical Unit	The unique integer assigned to your instrument when using SICL LAN	8
Emulated GPIB Name	The name (same as the remote SICL address) of the device used when communicating with your instrument	gpib7
Emulated GPIB Logical Unit	The unique integer assigned to your device when it is being controlled using SICL LAN	8
Emulated GPIB Address	The emulated GPIB address assigned to your transmitter tester when it is a SICL server (the same as your GPIB address)	18

Connection String & Copy Button

In "**SCPI LAN**" on page 2695, the full connection string is displayed to the right of the **SICL Server****ON/OFF** control. Pressing **Copy**, to the right of the string copies the connection string to the Windows clipboard.

Remote Command	:SYSTem:COMMunicate:LAN:SCPI:SICL:ENABle OFF ON 0 1 :SYSTem:COMMunicate:LAN:SCPI:SICL:ENABle?
Example	:SYST:COMM:LAN:SCPI:SICL:ENAB OFF
Dependencies	Not available in UXM If the Secure Instrument Communications configuration has disabled this connection, local changes are not allowed, and an attempt to do so results in error -221, "Disabled by Secure Instrument Communications configuration"
Preset	Unaffected by Preset , but set to ON by Restore System Defaults->Misc If not set up or specified, the Secure Instrument Communications configuration setting: is ON
State Saved	No
Range	OFF ON

4.2.2.4 HiSLIP Server

Turns the **HiSLIP Server** capability **ON** or **OFF**, to limit SCPI access over LAN through the HiSLIP server.

HiSLIP stands for High-Speed LAN Instrument Protocol, and is part of the IVI-6.1 specification.

Example of a VISA connection string used to connect to the HiSLIP Server on an X-Series Spectrum Analyzer:

```
TCPIP0::a-n9030a-93016::hislip0::INSTR
```

In the example above, **hislip0** is the HiSLIP device name that VISA users must include in HiSLIP VISA Address strings. Your HiSLIP device name may differ, depending on your VISA settings.

Connection String & Copy Button

In "**SCPI LAN**" on page 2695, the full connection string is displayed to the right of the **HiSLIP Server ON/OFF** control. Pressing **Copy**, to the right of the string copies the connection string to the Windows clipboard.

Remote Command	<code>:SYSTem:COMMunicate:LAN:SCPI:HISLip:ENABle OFF ON 0 1</code>
Example	<code>:SYST:COMM:LAN:SCPI:HISL:ENAB OFF</code>
Preset	Unaffected by Preset , but set to ON by Restore System Defaults->Misc If not set up or specified, the Secure Instrument Communications configuration setting: is ON
State Saved	No
Range	OFF ON

4.2.2.5 Verbose SCPI On/Off

When you turn **Verbose SCPI ON**, additional information is returned by `:SYSTem:ERRor?`. The additional information consists of the characters that stimulated the error. This can aid you in debugging your test programs, by indicating where in the parsing of a SCPI command the instrument encountered an invalid command or query.

Specifically, with **Verbose SCPI ON**, `:SYSTem:ERRor?` is expanded to show the SCPI data received, with the indicator `<Err>` at the point in the stream that the error occurred.

Verbose SCPI has no effect on the **Show Errors** screen or front-panel Message Line; and only changes the response to `:SYST:ERR?`.

See the example below, where the invalid command `:SENS:BOGUS` is sent:

Normal response to `:SYST:ERR?` (using the Telnet window):

```
SCPI> SENS:BOGUS
SCPI> SYST:ERR?
-113,"Undefined header"
```

After turning on **Verbose SCPI**:

```
SCPI> SYST:BOGUS
SCPI> SYST:ERR?
-113,"Undefined header;SYST:BOGUS<Err>"
```

Remote Command	<code>:SYSTem:ERRor:VERBoSe OFF ON 0 1</code> <code>:SYSTem:ERRor:VERBoSe?</code>
Example	<code>:SYST:ERR:VERB ON</code>
Preset	Unaffected by Preset , but set to OFF by Restore System Defaults->Misc
State Saved	No
Range	OFF ON

4.2.2.6 Device Clear on Disconnect

When using HiSLIP (High Speed LAN Instrument Protocol), Telnet, or Sockets, a communication session with the instrument is opened when you connect, and closed when you disconnect. This differs from other connections such as GPIB, USB and VXI-11 connections, which are never actually closed but stay open as long as the instrument is running.

When a session is closed, a Device Clear function is generated, which affects the entire instrument, not just the current connection. Thus, when using HiSLIP, Telnet, or Sockets, unexpected Device Clears may occur, which can disrupt measurements in ways that GPIB and VXI-11 “sessions” do not.

Device Clear on Disconnect enables these auto-generated Device Clears for Telnet, Socket, and HiSLIP sessions. For backwards compatibility, they are *not* generated unless you explicitly enable them.

There is no change in VXI-11, USB, or GPIB session behavior. These sessions do not close when you disconnect, have never generated Device Clear events, and still do not generate Device Clear events, regardless of the setting of this switch.

Remote Command	<code>:SYSTem:COMMunicate:LAN:SCPI:EOSession:DCLEar:ENABle 0 1 ON OFF</code> <code>:SYSTem:COMMunicate:LAN:SCPI:EOSession:DCLEar:ENABle?</code>
Example	<code>:SYST:COMM:LAN:SCPI:EOS:DCLE:ENAB ON</code>
Preset	Unaffected by Preset , but set to OFF by Restore System Defaults->Misc

State Saved	No
Range	OFF ON

4.2.2.7 SCPI Socket Control Port (Remote Query Only)

Returns the TCP/IP port number of the control socket associated with the SCPI socket session. This query enables you to obtain the unique port number to open when a device clear is to be sent to the instrument. Every time a connection is made to the SCPI socket, the instrument creates a peer control socket. The port number for this socket is random. You must use this command to obtain the port number of the control socket. To force a device clear on this socket, open the port and send the string `DCL\n` to the instrument.

If this query is sent to a non-SCPI Socket interface, then 0 is returned.

Remote Command	<code>:SYSTem:COMMunicate:LAN:SCPI:SOCKet:CONTRol?</code>
Example	<code>:SYST:COMM:LAN:SCPI:SOCK:CONT?</code>
Preset	Unaffected by Preset or Restore System Defaults->Misc
State Saved	No
Range	0 to 65534
Min	0
Max	65534
Backwards Compatibility SCPI	<code>:SYSTem:COMMunicate:TCPIp:CONTRol?</code>

4.2.2.8 SCPI Instrument Port (Remote Query Only)

Some MIMO applications need to be able to determine the port to use to communicate with the instrument. This query returns the port number to use for communications.

Remote Command	<code>:SYSTem:COMMunicate:LAN:INSTrument:PORT?</code>
----------------	---

4.2.3 Web Password Reset

The embedded web server contains certain capabilities that are password-protected; modifying the LAN configuration of the instrument, and access to web pages that can change the settings of the instrument. The default password from the factory is:

`measure4u`

This control lets you set the web password as desired, or to reset the password to the factory default.

Selecting **Web Password Reset** displays a control for resetting the password as desired, or to the factory default. The built-in alpha keyboard appears. You may change the password from the factory default of “**measure4u**”.

You can cancel this entry by pressing the **Cancel (ESC)** front-panel key.

Dependencies	Not available in UXM
--------------	----------------------

4.2.4 LXI

Accesses various **LXI** configuration properties.

Dependencies	Not available in UXM
--------------	----------------------

4.2.4.1 LAN Reset

Resets the LAN connection. This sets parameters as follows, and restarts the LAN operation:

DHCP	Enabled
Automatic IP Address	Enabled
ICMP Ping Responder	Enabled
Web Password	keysight
Dynamic DNS	Enabled
mDNS and DNS-SD	Enabled
Dynamic Link Local Addressing	Enabled
Auto Negotiation	Enabled

There is no SCPI command for this function.

4.2.4.2 Device Identification (Remote Command Only)

Enabling LXI device identification places the LXI Status Indicator in the **Identify** state. Disabling LXI device identification places the LXI Status Indicator in the **No Fault** state. The LXI Status indicator is in the upper left region of the instrument’s graphical user interface.

Remote Command	:LXI:IDENtify[:STATE] OFF ON 0 1 :LXI:IDENtify[:STATE]?
----------------	--

Example	:LXI:IDEN ON
---------	---------------------

Preset	Not part of Preset , but reset to OFF by Restore System Defaults All
State Saved	No
Range	OFF ON

4.2.5 System IDN Response

Allows you to specify a response to ***IDN?**, return the instrument to the **FACTory** response if you have changed it, or, if your test software is expecting the ***IDN** response to indicate Agilent Technologies, configure the instrument to respond with Agilent as the manufacturer.

The current ***IDN** response is displayed at the top of the panel, followed by the **System IDN Response** and **User IDN** controls.

4.2.5.1 System IDN Response

To select the factory-set response, select **FACTory**. To specify your own response, select **USER**. You can enter your desired response using "**User IDN**" on page 2703.

If your test software expects the response to indicate Agilent Technologies as the Manufacturer, you can configure this response by selecting **AGILent**.

Remote Command	:SYSTem:IDN:CONFigure FACTory AGILent USER For option details, see " More Information " on page 2702 :SYSTem:IDN:CONFigure?
Example	:SYST:IDN:CONF FACT
Notes	Affects the response returned by all Modes of the instrument, unless the current Mode has <i>also</i> specified a custom response, in which case the current Mode's custom IDN response takes precedence over the System's, but only while that Mode is current Survives shutdown and restart of the software and therefore survives a power cycle
Preset	The *IDN response is reset to FACTory by Restore Misc Defaults or Restore System Defaults All and survives subsequent running of the software

More Information

Here are details of the options available for the System ***IDN** response:

Factory

SCPI example: **:SYST:IDN:CONF** **FACT**

Selects the factory default configuration of ***IDN?**, which indicates the Manufacturer as Keysight Technologies. For example,

```
“Keysight Technologies,SP900S,MY00012345,A.15.00”
```

where the fields are Manufacturer, Model Number, Serial Number, Firmware Revision.

NOTE

In products that run multiple instances of the X-Series Application, all instances use the *same* factory System IDN response.

Agilent

SCPI example: `:SYST:IDN:CONF AGIL`

Starting with software version x.14.50, the ***IDN?** response in the Factory configuration indicates the Manufacturer as Keysight Technologies. If your test software is expecting the response to indicate Agilent Technologies, you can configure the response with this menu selection or SCPI command.

For example:

```
“Agilent Technologies,N9020A,MY00012345,A.05.01”
```

NOTE

In products that run multiple instances of the X-Series Application, all instances use the *same* Agilent System IDN response.

User

SCPI example: `:SYST:IDN:CONF USER`

Selects your customized configuration of ***IDN?**

Enter your desired response using "User IDN" on page 2703.

4.2.5.2 User IDN

Allows you to specify your own response to ***IDN?**. You may enter your desired response with the Alpha Editor or a plugin PC keyboard. Once the value is entered, select **USER** under **System IDN Response**.

When you select this control, the active function becomes the current User string and is highlighted, so typing replaces it. If instead you wish to edit the existing string, press the left or right arrow to go to the beginning or the end.

If you enter a null string (for example, by clearing the User String while editing and then pressing **Done**), the instrument automatically reverts to the **FACTory** setting.

NOTE

In products that run multiple instances of the X-Series Application, all instances use the *same* User System IDN response.

Remote Command	<code>:SYSTem:IDN <string></code> <code>:SYSTem:IDN?</code>
Notes	<p>The <code><string></code> must consist of four fields, each separated by a comma, example: <code>:SYST:IDN "XYZ Corp,Model 12,012345,A.01.01"</code></p> <p>The four fields are <code><manufacturer></code>, <code><model number></code>, <code><serial number></code>, <code><firmware revision></code>. The fields are comma-delimited, so text within a field cannot contain a comma</p> <p>This affects the response given in all Modes of the instrument, unless the current Mode has also specified a custom response, in which case the current Mode's custom IDN response takes precedence over the System's, but only while that Mode is current</p> <p>Survives shutdown and restart of the software and therefore survives a power cycle</p> <p>Null string as parameter restores the FACTory setting, example: <code>:SYST:IDN ""</code></p>
Preset	Unaffected by Preset , but set to the original FACTory setting by Restore System Defaults->Misc

4.2.5.3 SYSTem:PERSONa (Remote Commands Only)

The `:SYSTem:PERSONa` command set permits setting of individual fields of the `*IDN?` response.

- `"SYSTem:PERSONa:DEFault"` on page 2704
- `"SYSTem:PERSONa:MANufacturer"` on page 2705
- `"SYSTem:PERSONa:MANufacturer:DEFault"` on page 2705
- `"SYSTem:PERSONa:MODEl"` on page 2705
- `"SYSTem:PERSONa:MODEl:DEFault"` on page 2706

SYSTem:PERSONa:DEFault

Resets the `*IDN` response to the instrument default.

Remote Command	<code>:SYSTem:PERSONa:DEFault</code> <code>:SYSTem:PERSONa:DEFault?</code>
Notes	<p><code>:SYST:PERS:DEF?</code> returns the default value of <code>*IDN?</code> even if the current setting of <code>*IDN?</code> is the non-default value. The query return type is a <code><string></code> <code>:SYST:PERS:DEF</code></p> <p>is equivalent to:</p>

```
:SYSTem:IDN ""
:SYSTem:IDN:CONF DEF
```

SYSTem:PERSONa:MANUFACTURER

Sets the **MANUFACTURER** field of the ***IDN?** response. This is the first field of the ***IDN?** response.

Remote Command	:SYSTem:PERSONa:MANUFACTURER <string> :SYSTem:PERSONa:MANUFACTURER?
Notes	When setting the MANUFACTURER field, the current IDN response string is modified to replace the manufacturer field with the string specified by the command. If the resulting IDN response matches one of the predefined responses (:SYST:IDN:CONF FACT AGIL), then the :SYST:IDN:CONF is set to the corresponding value. If the IDN response with the new manufacturer field is not one of the predefined values, then :SYST:IDN:CONF will be set to USER and :SYST:IDN will be set to the new IDN response string The query returns the current value of the *IDN? Manufacturer field

SYSTem:PERSONa:MANUFACTURER:DEFAULT

Resets the **MANUFACTURER** field of the ***IDN?** response to the default value.

Remote Command	:SYSTem:PERSONa:MANUFACTURER:DEFAULT :SYSTem:PERSONa:MANUFACTURER:DEFAULT?
Notes	The query returns the default MANUFACTURER field value of *IDN? even if the current setting of *IDN? is the non-default value. The return type is a <string>

SYSTem:PERSONa:MODEL

Sets the **MODEL** field of the ***IDN?** response. This is the second field of the ***IDN?** response.

Remote Command	:SYSTem:PERSONa:MODEL <string> :SYSTem:PERSONa:MODEL?
Notes	When setting the MODEL field, the current IDN response string is modified to replace the model field with the string specified by the command. If the resulting IDN response matches one of the predefined responses (:SYST:IDN:CONF FACT AGIL), then :SYST:IDN:CONF is set to the corresponding value. If the IDN response with the new model field is not one of the predefined values, then :SYST:IDN:CONF will be set to USER and :SYST:IDN will be set to the new IDN response string The query returns the current value of the *IDN?MODEL field

SYSTem:PERSONa:MODEl:DEFault

Resets the **MODEl** field of the ***IDN?** response to the default value.

Remote Command	<code>:SYSTem:PERSONa:MODEl:DEFault</code>
Command	<code>:SYSTem:PERSONa:MODEl:DEFault?</code>
Notes	The query returns the default MODEl field value of *IDN? even if the current setting of *IDN? is the non-default value. The return type is a <code><string></code>

4.2.6 Restore I/O Config Defaults

Causes the group of settings associated with the **I/O Config** menu to be reset to their default values. This also happens on **Restore Misc Defaults**, which has a SCPI command.

When **Restore I/O Config Defaults** is selected, a message appears saying:

`This will reset all of the I/O Config variables to their default state, including the GPIB address and SCPI LAN settings`

`It will not affect Alignment data or settings`

`This action cannot be undone. Do you want to proceed?`

The message provides **OK** and **Cancel** buttons so you can affirm or cancel the operation.

4.2.7 Query USB Connection (Remote Query Only)

Enables you to determine the speed of the USB connection.

Remote Command	<code>:SYSTem:COMMunicate:USB:CONNectioN?</code>	
Example	<code>:SYST:COMM:USB:CONN?</code>	
Notes	NONE	Indicates no USB connection has been made
	LSpeed	Indicates a USB low speed connection (1.5 Mbps) Note that this is reserved for future use, the T+M488 protocol is not supported on low-speed connections
	HSPeed	Indicates that a USB high speed connection (480 Mbps) has been negotiated
	FSPeed	Indicates that a USB full speed connection (12 Mbps) has been negotiated
State Saved	No	
Range	NONE LSpeed HSPeed FSPeed	

4.2.8 USB Connection Status (Remote Query Only)

Enables you to determine the current status of the USB connection.

Remote Command	<code>:SYSTem:COMMunicate:USB:STATus?</code>
Example	<code>:SYST:COMM:USB:STAT?</code>
Notes	<p>SUSPended – Indicates that the USB bus is currently in its suspended state. The bus is in the suspended state when:</p> <ul style="list-style-type: none"> – The bus is not connected to any controller – The controller is currently powered off – The controller has explicitly placed the USB device into the suspended state <p>When in the suspended state, no USB activity, including start of frame packets are received</p> <p>ACTive – Indicates that the USB device is in the active state. When the device is in the active state, it receives periodic frame starts, but is not necessarily receiving or transmitting data</p>
State Saved	No
Range	<code>SUSPended</code> <code>ACTive</code>

4.2.9 USB Packet Count (Remote Query Only)

Enables you to determine the number of packets received and transmitted on the USB bus.

Remote Command	<code>:SYSTem:COMMunicate:USB:PACKets?</code>
Example	<code>:SYST:COMM:USB:PACK?</code>
Notes	<p>Two integers are returned:</p> <ol style="list-style-type: none"> 1. The number of packets received since application invocation 2. The number of packets transmitted since application invocation <p>If no packets have been received or transmitted, the response is <code>0,0</code></p> <p>The packet count is initialized to <code>0,0</code> when the instrument application is started</p>
State Saved	No

4.2.10 Lock Remote I/O Session (Remote Command only)

An instrument can support multiple remote I/O sessions at the same time. However, you cannot *simultaneously* send remote commands from multiple

sessions to the same instrument. The results in such a case are undefined.

Ensure that only *one* session actively controls the instrument at a time. Other sessions must wait until the active session finishes the instrument control.

To help achieve this cooperative instrument sharing, the following remote commands are provided:

- "Lock Remote I/O Request (Remote Query only)" on page 2709
- "Unlock Remote I/O Session (Remote Command only)" on page 2710
- "Remote I/O Session Lock Name (Remote Query only)" on page 2710
- "Remote I/O Session Lock Owner (Remote Query only)" on page 2711

Example Procedure for Lock Usage

Step	Action
1	Each session tries to obtain a lock by sending <code>:SYSTem:LOCK:REQuest?</code> This query can be sent simultaneously from multiple sessions
2	Only one session will be granted. The granted session receives 1 in response to its query
3	The granted session actively controls the instrument Meanwhile, other sessions must wait, and must periodically send <code>:SYSTem:LOCK:REQuest?</code> , requesting the lock
4	When the active session finishes its task, it releases the lock by sending <code>:SYSTem:LOCK:RELease</code>
5	Now the lock has become available, so when one of the waiting sessions sends <code>:SYSTem:LOCK:REQuest?</code> , it receives 1 in response, granting the lock to that session

By repeating steps 3, 4, and 5 above, multiple sessions can share the same instrument in a cooperative fashion.

NOTE

A session can query its own unique session name by sending `:SYSTem:LOCK:NAME?`. This session name is determined by the instrument.
A session also can query the name of the currently granted session by sending `:SYSTem:LOCK:OWNer?`.

NOTE

Remote I/O interfaces are grouped in two types: single-session interface and multi-session interface. Both types of interfaces can be used for cooperative instrument sharing.
The recommended interface is LAN HiSLIP.

Interface	Single-session	Multi-Session
GPIB	x	
USB-488	x	
LAN VXI-11 (SICL)	x	
LAN Socket		x
LAN HiSLIP		x
LAN Telnet		x

If using a single-session interface, care must be taken to ensure only one client uses the single-session interface.

In particular, LAN VXI-11 (SICL) interface is a single-session interface, even though multiple clients could simultaneously connect to this interface. Such multiple VXI-11 clients share the same session context; the same status registers and the same error queue. Even a SCPI query response can be received by another client. Furthermore, the lock obtained by `:SYSTem:LOCK:REQuest?` is shared among all VXI-11 clients, allowing all of them to actively control the instrument.

If a LAN VXI-11 (SICL) interface must be used by multiple clients for a cooperative instrument sharing, then VISA locking *must* be used, *in addition to* Remote I/O Session Lock.

4.2.10.1 Lock Remote I/O Request (Remote Query only)

You can lock the SCPI control of the instrument to the I/O Interface and Session by sending `:SYSTem:LOCK:REQuest?`. This permits cooperative sharing of the instrument between multiple computers, or multiple sessions from the same computer.

Remote Command	<code>:SYSTem:LOCK:REQuest?</code>
Example	<code>:SYST:LOCK:REQ?</code>
Notes	<p>Returns 1 if the lock request is granted, or 0 if the request is denied</p> <p>Lock requests on an individual interface and session can be nested and each request will increase an internal lock count by 1. For every granted request, send <code>:SYST:LOCK:REL</code> to decrement the internal lock count to fully relinquish the lock</p> <p>When the instrument is locked, Bit 0 is set in the Operation Instrument status register</p> <p>Disconnecting the individual interface and session releases the lock if the lock is granted to the interface and session</p> <p>A Device Clear over any interface and session releases the lock, regardless of the interface and session which obtained the lock</p> <p>The following queries are permitted over any interface and session, even if an interface has the instrument locked:</p>

-
- *IDN?
 - *OPT?
 - *STB?
 - *ESR?
 - :SYSTem:DATE?
 - :SYSTem:TIME?
 - :SYSTem:PON:TIME?
 - Queries in the :STATus subsystem
 - Queries in the :SYSTem:ERRor subsystem
 - Queries in the :SYSTem:LKEY subsystem
 - Queries in the :SYSTem:LOCK subsystem
 - Queries in the :SYSTem:METRics subsystem
 - Queries in the :SYSTem:MODuLe subsystem

All other commands and queries result in error: -203, "Command protected; Instrument locked by another I/O session"

State Saved Not part of Save/Recall

4.2.10.2 Unlock Remote I/O Session (Remote Command only)

You can unlock the SCPI control of the current I/O Interface and Session by sending **:SYSTem:LOCK:RELease**. Lock requests on an individual interface and session can be nested, and each request increases an internal lock count by 1. For every granted request, you will need to perform a release. The lock is not relinquished until the internal lock count reaches 0.

Remote Command **:SYSTem:LOCK:RELease**

Example **:SYST:LOCK:REL**

Notes When the instrument is unlocked, Bit 0 is cleared in the Operation Instrument status register

4.2.10.3 Remote I/O Session Lock Name (Remote Query only)

Use this query to obtain the name of the current I/O Interface and Session.

Remote **:SYSTem:LOCK:NAME?**

Command	
Example	<code>:SYST:LOCK:NAME?</code>
Notes	<p>The information returned is a string of the format:</p> <pre><I/O Interface>[/<IP address>/<Session ID>]</pre> <p>Where IP address and Session ID are only provided for interfaces that provide multiple sessions. Single Session interfaces (GPIB, USB-488, and LAN VXI-11) only list interface name.</p> <p>Session ID is an internally generated identifier. It is not guaranteed to be consistent across instrument software versions (the identifier is subject to change when the software of the instrument is updated). The absolute value of Session ID is not significant, but the identifier will be consistent for a given software version, and can be relied upon for lock owner logic comparisons.</p>

4.2.10.4 Remote I/O Session Lock Owner (Remote Query only)

Use this query to determine which I/O Interface and Session has the SCPI locked. If no interface and session has the SCPI locked, then the return value is **NONE**.

Remote Command	<code>:SYSTem:LOCK:OWNer?</code>
Example	<code>:SYST:LOCK:OWN?</code>
Notes	<p>The information returned is a string of the format:</p> <pre><I/O Interface>[/<IP address>/<Session ID>]</pre> <p>Where IP address and Session ID are only provided for interfaces that provide multiple sessions. Single Session interfaces (GPIB, USB-488, and LAN VXI-11) only list interface name.</p> <p>Session ID is an internally generated identifier. It is not guaranteed to be consistent across instrument software versions (the identifier is subject to change when the software of the instrument is updated). The absolute value of Session ID is not significant, but the identifier will be consistent for a given software version, and can be relied upon for lock owner logic comparisons.</p> <p>If no interface and session has the SCPI locked, then the return value is NONE.</p>

4.2.11 Multiple Network Interface Card Configuration (Remote Commands Only)

Systems that have multiple Network Interface Cards (**NICs**) require additional configuration information. The following keys can be added to the XApps configuration file:

- **PrimaryNICIPv4** – IP address value is a string with the exact IP V4 format. Required field in IP v4 networks.
- **PrimaryNICIPv6** – IP address value is a string with the exact IP V6 format. Required field in IP v6 networks.

These commands do not apply to instruments that have only one NIC. The commands apply to all modular deployments that have a controller with multiple NICs.

To configure and query these configuration options, the following remote commands are provided:

- "Multiple Network Adapters Enabled (Remote Query Only)" on page 2712
- "Config IPV4 Address (Remote Command Only)" on page 2712
- "Config IPV6 Address (Remote Command Only)" on page 2713
- "List All Physical Network Adapter IP Addresses (Remote Query Only)" on page 2713

4.2.11.1 Multiple Network Adapters Enabled (Remote Query Only)

Remote Command	<code>:SYSTem:COMMunicate:LAN:MULTiple:NIC:ENABLEd?</code>
Example	<code>:SYSTem:COMMunicate:LAN:MULTiple:NIC:ENABLEd?</code>
Notes	<p>Applies to Instruments that have multiple Network Adapters. When more than one network adapter is present in the system, and they are Enabled (that is, they have a valid IP Address), this query returns:</p> <ul style="list-style-type: none"> – 1, if more than one NIC enabled – 0, if only one or No NICs are enabled
State Saved	No

4.2.11.2 Config IPV4 Address (Remote Command Only)

Remote Command	<code>:SYSTem:COMMunicate:LAN:IPV4:CONFig <ipaddress></code> <code>:SYSTem:COMMunicate:LAN:IPV4:CONFig?</code>
Example	<code>:SYSTem:COMMunicate:LAN:IPV4:CONFig "192.168.1.146"</code> <code>:SYSTem:COMMunicate:LAN:IPV4:CONFig?</code>
Notes	<p>Applies to instruments that have multiple Network Adapters. When more than one network adapter is present in the system, you must specify in the instrument config file the IP address to use to enable Remoting channel bindings. If this is not provided, Remoting connections are likely to fail on systems where multiple NICs are enabled</p> <p>Sets the valid IPV4 address, passed in as string in the config file</p> <p>The query returns IPV4 address, as a string</p> <p>If config file is missing, "" (empty string) is returned</p> <p>Changing the IPV4 value requires a restart of the instrument software, to ensure that servers use the configured IP address</p>
State Saved	No

4.2.11.3 Config IPV6 Address (Remote Command Only)

Remote Command	<code>:SYSTem:COMMunicate:LAN:IPV6:CONFig <ipaddress></code> <code>:SYSTem:COMMunicate:LAN:IPV6:CONFig?</code>
Example	<code>:SYSTem:COMMunicate:LAN:IPV6:CONFig "2001:0d-b8:85a3:0000:0000:8a2e:0370:7334"</code> <code>:SYSTem:COMMunicate:LAN:IPV6:CONFig?</code>
Notes	<p>Applies to instruments that have multiple Network Adapters. When more than one network adapter is present in the system, you must specify in the instrument config file the IP address to use to enable Remoting channel bindings. If this is not provided, Remoting connections are likely to fail on systems where multiple NICs are enabled</p> <p>Sets the valid IPV6 address, passed in as string in the config file</p> <p>The query returns IPV6 address, as a string</p> <p>If config file is missing, "" (empty string) is returned</p> <p>Changing the IPV6 value requires a restart of the instrument software, to ensure servers use the configured IP address</p>
State Saved	No

4.2.11.4 List All Physical Network Adapter IP Addresses (Remote Query Only)

Remote Command	<code>:SYSTem:COMMunicate:LAN:PHYSical:IPADdress:LIST?</code>
Example	<code>:SYSTem:COMMunicate:LAN:PHYSical:IPADdress:LIST?</code> <code>"192.168.1.146,2001:0db8:85a3:0000:0000:8a2e:0370:7334"</code>
Notes	Returns the IP Addresses of the physical network adapters found in the PC/Instrument
State Saved	No

4.3 Preload / Unload Modes

The X-Series platform supports many Modes. Each Mode that is loaded uses a portion of the total available memory. At some point, this may result in insufficient free memory. This can occur during a measurement, or when loading a new Mode. A limited number of Modes can be loaded without impacting performance.

Preload / Unload Modes allows you to select and enable Modes to be preloaded at startup, and to specify the default **Power-On Mode**.

The dialog includes the following controls:

- "Power-On Mode" on page 2714
- "Table of Modes" on page 2715
- "Preload: Select All, Preload: Deselect All" on page 2715
- "Move Up, Move Down" on page 2715
- "Unload" on page 2715

Modes that are not preloaded may be loaded at runtime as needed, resources permitting. However, note that loading more Modes increases memory consumption and may adversely impact performance.

When a memory-full situation occurs, the instrument notifies you with the following message:

```
Out of memory; Insufficient resources. Please save state if needed. You have following options:
```

1. Open System Settings > Configure Preload Modes to unload unused Modes
2. Reconfigure preloaded Modes on the above dialog, close and restart the analyzer SW
3. Close and restart the analyzer SW

Option 1 allows you to unload unused Modes and continue running the software, without having to restart it.

The command `:INSTRUMENT:UNLoad <mode>` provides equivalent functionality; see "Unload" on page 2715.

4.3.1 Power-On Mode

Displays a list of licensed Modes. Use this control to change the factory default Power-On Mode. The instrument will execute the selected Mode after power up.

Selecting the Power-On Mode here automatically enables that Mode for preloading.

4.3.2 Table of Modes

The table of Modes becomes scrollable when the number of Modes exceeds the dialog's displayable size.

Use the check boxes in the **Preload** column to enable or disable the preloading of the Modes that you want.

Use the check boxes in the **Unload** column to select the Modes that you want to unload.

The Unload check boxes are grayed-out when the Modes are used by other Modes.

Example:

5G NR & V2X Mode cannot be loaded when either Sequence Analyzer Mode or Power Amplifier Mode are already loaded, because these Modes use 5G NR & V2X Mode. To unload 5G NR & V2X Mode, both Sequence Analyzer Mode and Power Amplifier Mode must be unloaded first.

When the active Mode is unloaded, the screen becomes blank except for the message; **"No Mode is active"**. You can then select another desired Mode.

When multiple screens are open, and a Mode is unloaded, inactive screens that have that Mode as their active Modes are closed.

The active screen is never closed.

4.3.3 Preload: Select All, Preload: Deselect All

Toggles the **Preload** checkbox state for all Applications listed, except for the Power-On Application, which is always selected.

4.3.4 Move Up, Move Down

The default order in which Applications are listed in the table is the order in which they are displayed in the **Mode/Measurement/View** Selector dialog. To change the order in this list, select the desired Application row from the table, then click **Move Up** or **Move Down** to move it to the desired position.

4.3.5 Unload

Unloads the specified Mode.

4 System
4.3 Preload / Unload Modes

Remote Command	<code>:INSTRument:UNLoad <mode></code>
Example	<code>:INST:UNL NR5G</code>
Notes	<p>Error message if the specified Mode is not available, <code>-224,"Illegal parameter value;<mode> is not a valid choice"</code></p> <p>Error message if the specified Mode is not loaded and therefore cannot be unloaded, <code>-221,"Settings conflict;<mode> is not loaded"</code></p> <p>Error message if the specified Mode is used by other Modes and therefore cannot be unloaded, <code>-221,"Settings conflict;<mode> is used by <other modes>"</code></p> <p>Error message if the specified Mode does not support Unload Mode feature and therefore cannot be unloaded, <code>-221,"Settings conflict;Feature not supported for this Mode"</code></p>

4.3.6 Loaded Modes (Remote Command Only)

Returns a list of loaded Modes.

Remote Command	<code>:SYSTem:APPLication:LOADed?</code>
Example	<code>:SYST:APPL:LOAD?</code>
Preset	Not affected by Preset

4.4 User Interface

Configures functions specific to the User Interface, such as the menu panel orientation and the display color theme.

4.4.1 Menu Panel Position

Allows the Menu Panel to be positioned on the **RIGHT** or **LEFT** side of the display.

Remote Command	<code>:SYSTem:DISPlay:MPPosition RIGHT LEFT</code> <code>:SYSTem:DISPlay:MPPosition?</code>
Example	<code>:SYST:DISP:MPP LEFT</code>
Preset	This is unaffected by Preset but is set to RIGHT by Restore User Interface Defaults or Restore System Defaults->All
State Saved	Power On Persistent (survives shutdown and restart)

4.4.2 Menu Panel Tabs

Allows the **Menu Panel Tabs** to be positioned on the **RIGHT** or **LEFT** side of the menu panel.

Remote Command	<code>:SYSTem:DISPlay:MPTab RIGHT LEFT</code> <code>:SYSTem:DISPlay:MPTab?</code>
Example	<code>:SYST:DISP:MPT LEFT</code>
Preset	This is unaffected by Preset but is set to RIGHT by Restore User Interface Defaults or Restore System Defaults->All
State Saved	Power On Persistent (survives shutdown and restart)

4.4.3 Annotations Local Settings/All Off

Overrides the annotation settings for all measurement in all modes and turns them all off. This provides the security based "annotation off" function of previous instruments; hence it uses the legacy SCPI command.

When this control is set to **All Off**, the **Screen Annotation**, **Meas Bar**, **Trace Annotation**, and **Control Annotation** controls under the **Display, Annotation** menu are grayed-out and forced to **OFF** for all measurements in all modes. When **Local Settings** is selected, you can set the local annotation settings on a measurement-by-measurement basis.

Remote Command	<code>:DISPlay:WINDow[1]:ANNotation[:ALL] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:ANNotation[:ALL]?</code>
Example	<code>:DISP:WIND:ANN OFF</code>
Preset	This is unaffected by Preset but is set to ON by Restore User Interface Defaults , Restore Misc Defaults or Restore System Defaults->All
State Saved	Power On Persistent (survives shutdown and restart)
Backwards Compatibility Notes	The WINDow parameter and optional subopcode is included for backwards compatibility but ignored – all windows are equally affected

4.4.4 Display Theme

Allows you to change the **Display Theme**. This is similar to the Themes selection under Page Setup and Save Screen Image.

The two available themes are:

- **FILLed**: this is the normal theme using filled objects
- **OUTLine**: this theme uses color, but does not use fill for most areas on the display. It is ideal for images that need to be printed on inkjet printers. Although setting **Display Theme** to **OUTLine** does not affect screen image saves or prints, it does show you exactly how screen images will look when using the **OUTLine** theme under **Save Screen Image**, and how prints will look when using the **OUTLine** theme under **Page Setup**.

NOTE

Although the **OUTLine** theme eliminates most of the filled area, some objects remain filled. In particular, the selected marker remains filled with the green marker color, to distinguish it from the other markers. This is important, as it is the selected marker whose readout appears in the upper right corner of the display.

Remote Command	<code>:DISPlay:THEMe TDColor TDMonochrome FCOLOR FMONochrome FILLed OUTLine</code> <code>:DISPlay:THEMe?</code>
Example	<code>:SYST:DISP:THEM OUTL</code> sets the display style to OUTLine
Notes	To permit code compatibility with A-model X-Series Signal Analyzer instruments, the command parameters from the A-models are mapped as follows: <ul style="list-style-type: none"> – TDColor and TDMonochrome are both mapped to FILLed (exact full color representation of what is on the screen) – FCOLOR and FMONochrome are both mapped to OUTLine (uses color for traces and other items, but most filled areas are white)

	There is no Monochrome theme in the B-model instruments, so the monochrome commands for the A-model instruments yield color themes The query of <code>:DISPlay:THEMe?</code> always returns <code>FILLed</code> or <code>OUTLine</code> . It never returns <code>FCOLor</code> , <code>FMONochrome</code> , <code>TDCoLor</code> , or <code>TDMonochrome</code>
Preset	This is unaffected by <code>Preset</code> but is set to <code>FILLed</code> by <code>Restore User Interface Defaults</code> , <code>Restore Misc Defaults</code> or <code>Restore System Defaults->All</code>
State Saved	Power On Persistent (survives shutdown and restart)

4.4.5 Backlight

Turns the display **Backlight** on and off. This setting may interact with settings under the Windows **Power** menu.

When the backlight is **OFF**, pressing ESC, TAB, SPACE, ENTER, UP, DOWN, LEFT, RIGHT, DEL, BKSP, CTRL, or ALT turns the backlight **ON** without affecting the application. Pressing any other key turns backlight **ON**, and could potentially perform the action as well.

Remote Command	<code>:DISPlay:BACKlight ON OFF</code> <code>:DISPlay:BACKlight?</code>
Example	<code>:DISP:BACK ON</code> Turns backlight ON <code>:DISP:BACK OFF</code> Turns backlight OFF
Preset	Pressing any key turns the backlight back ON , as does <code>Restore User Interface Defaults</code> , <code>Restore Misc Defaults</code> or <code>Restore System Defaults->All</code>
State Saved	Not saved in State

4.4.6 Backlight Intensity

Allows the **Backlight Intensity** to be controlled from the UI settings panel.

Remote Command	<code>:SYSTem:DISPlay:BACKlight:INTensity <integer></code> <code>:SYSTem:DISPlay:BACKlight:INTensity?</code>
Example	<code>:SYST:DISP:BACK:INT 67</code>
Preset	100
State Saved	Power On Persistent (survives shutdown and restart)
Range	0-100

4.4.7 Hints

Hints are descriptions that provide additional information for a control. You can set **Hints** to be enabled or disabled.

Remote Command	<code>:SYSTem:DISPlay:HINTs[:STATe] OFF ON 0 1</code> <code>:SYSTem:DISPlay:HINTs?</code>
Example	<code>:SYST:DISP:HINT OFF</code>
Preset	This is unaffected by Preset but is set to ON by Restore User Interface Defaults or Restore System Defaults->All
State Saved	Power On Persistent (survives shutdown and restart)

4.4.8 Numeric Entry Auto Open

Configures whether the **Numeric Entry** Panel will appear immediately when an active function control is activated (Auto Open **ON**), or be deferred until you touch it again or begin to enter a value (Auto Open **OFF**). When configured for Auto Open **OFF** (the default), adjusting the value with the front panel Up/Down keys or the RPG hides the **Numeric Entry** Panel.

Remote Command	<code>:SYSTem:DISPlay:NEPimmediate ON OFF 1 0</code> <code>:SYSTem:DISPlay:NEPimmediate?</code>
Example	<code>:SYST:DISP:NEP OFF</code>
Preset	This is unaffected by Preset but is set to ON by Restore User Interface Defaults or Restore System Defaults->All
State Saved	Power On Persistent (survives shutdown and restart)

4.4.9 Touch On/Off

Turns the touch functionality on and off on the display. If **OFF**, you can turn it back on using the front panel **Touch On/Off** key, or by using a mouse to toggle this control.

Preset	Always starts up ON Unaffected by Preset but is turned ON by Restore User Interface Defaults or Restore System Defaults->All
State Saved	Not saved in state, not affected by Preset , not Power On Persistent (does not survive shutdown and restart)

4.4.10 Control Size

Configures the size of the controls in the user interface. This can be used to make screen dumps from a large screen instrument match those from a smaller screen instrument, to make the controls more readable on a large-screen instrument, or to display more information on a smaller screen instrument.

Remote Command	<code>:DISPlay:UINTerface:CSIZe SMALL LARGe</code> <code>:DISPlay:UINTerface:CSIZe?</code>
Example	<code>:DISP:UINT:CSIZ LARG</code>
Preset	This is unaffected by Preset but is set to SMALL by Restore User Interface Defaults or Restore System Defaults->All
State Saved	Power On Persistent (survives shutdown and restart)

4.4.11 Quick Save Mode

When **Quick Save Mode** is **NORMal** (the default setting), the instrument does an immediate save of a new file of the same type and to the same directory as the previous **Save** action. When **Quick Save Mode** is in the **PROMpt** state, instead of immediately performing a **Save**, the Alpha Keyboard appears with the proposed auto-filename in the entry area. You can then press **Enter** to accept the auto filename, or edit the name then press **Enter**. This allows you to easily save a file with a custom file name.

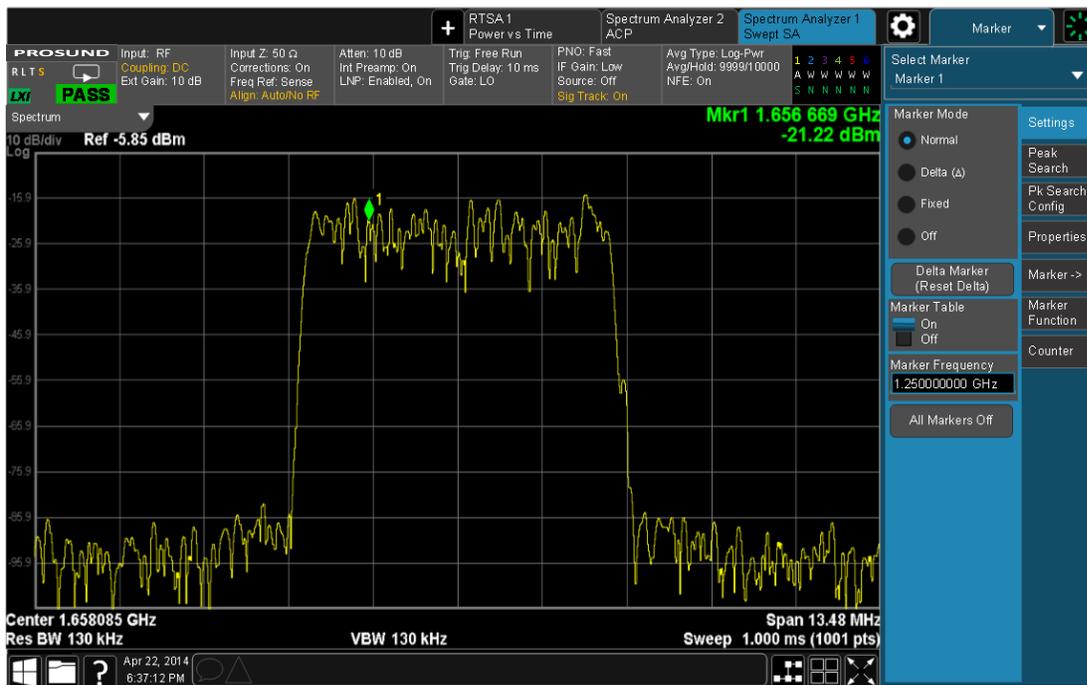

Remote Command	<code>:MMEMory:STORe:QSAVe NORMal PROMpt</code> <code>:MMEMory:STORe:QSAVe?</code>
Example	<code>:MMEM:STOR:QSAV PROM</code>
Preset	This is unaffected by Preset but is set to NORMal by Restore User Interface Defaults or Restore System Defaults->All
State Saved	Power On Persistent (survives shutdown and restart)

4.4.12 Screen Tabs Left/Right

This switch, when in the **RIGHT** position, makes the screen tabs start on the right and build across to the left, thus minimizing the finger travel over to the screen tab when there is only one screen. When tabs are added from right to left, they appear as below:

4 System

4.4 User Interface

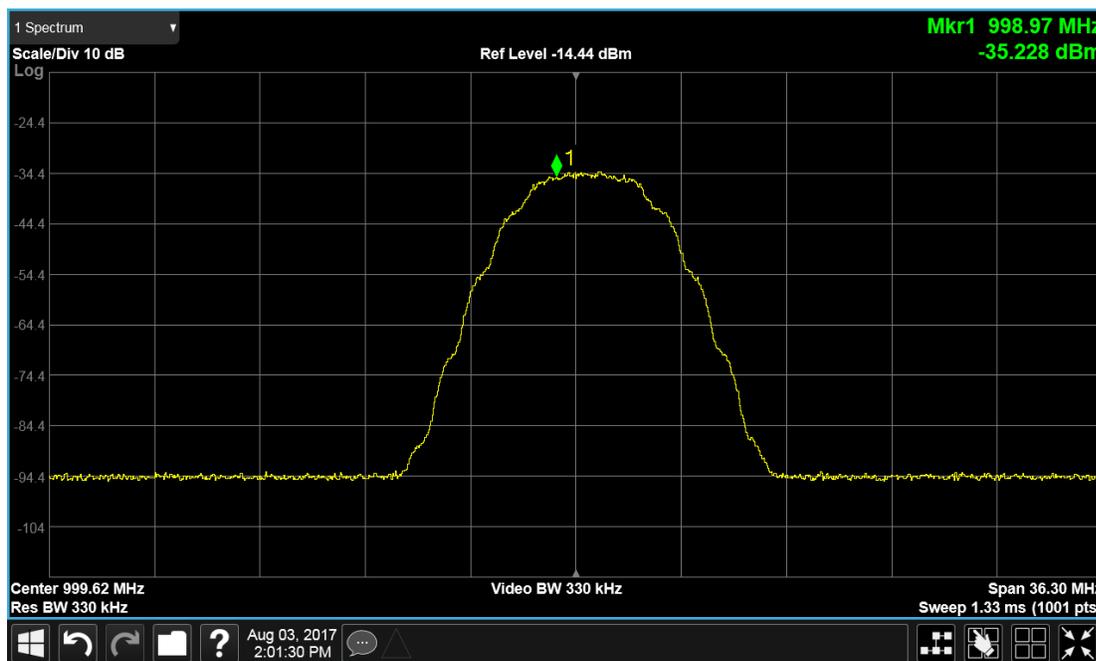

The default is **LEFT**.

Remote Command	:DISPlay:UINterface:STAB RIGHT LEFT :INSTrument:SCReen:STAB?
Example	:DISP:UINT:STAB RIGH
Preset	This is unaffected by Preset but is set to LEFT by Restore User Interface Defaults or Restore System Defaults->All
State Saved	Power On Persistent (survives shutdown and restart)

4.4.13 Hide Screen Tabs in Full Screen

This switch, when in the **ON** position, causes the Screen Tabs to be hidden when in Full Screen view, thus maximizing the display area available for results. By also turning off the Meas Bar (in the **Display, Annotation** menu), you can maximize the available area for results, as shown below:

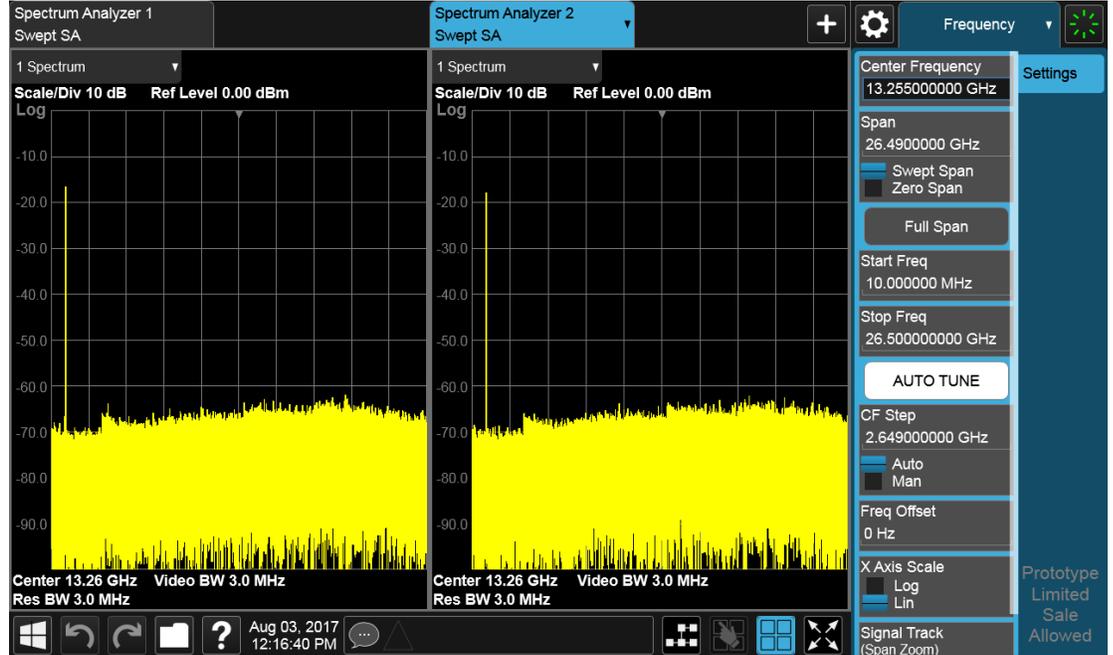

Remote Command	<code>:DISPlay:UINterface:HTABs ON OFF 1 0</code>
Example	<code>:DISP:UINT:HTAB ON</code> Hide the tabs in full screen
Preset	This is unaffected by Preset but is set to OFF by Restore User Interface Defaults or Restore System Defaults->All
State Saved	Power On Persistent (survives shutdown and restart)

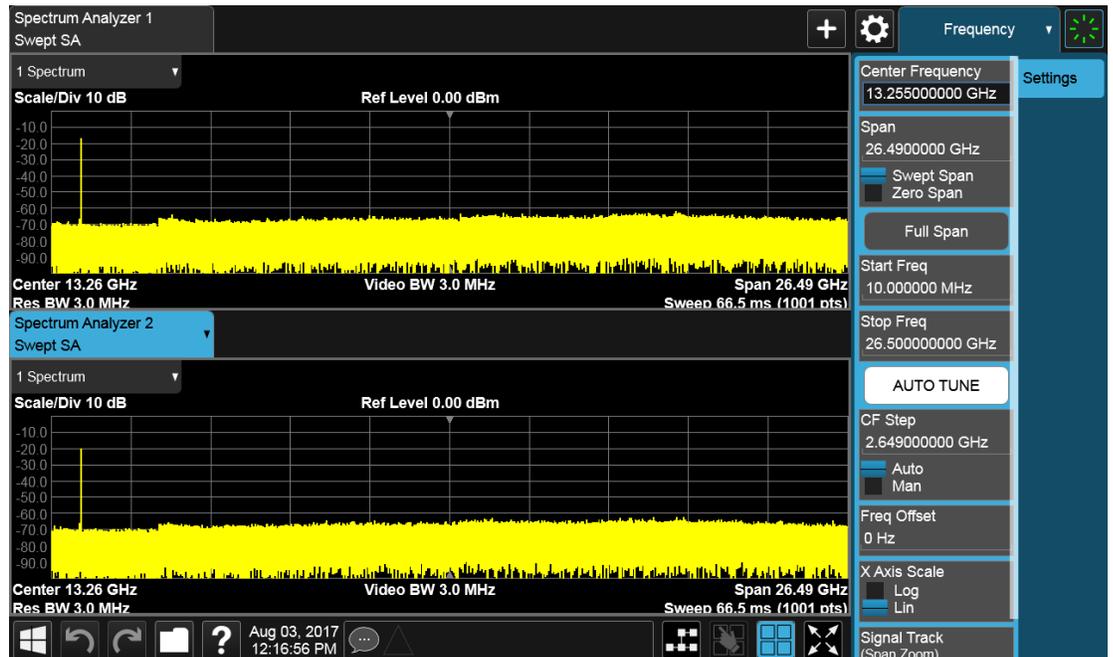

4.4.14 2-Screen Orientation

When you add a second Screen using the “+” control on the Screen Tabs bar, normally the screen is added to the right of the first screen. However, sometimes it is better to add the new screen below the first screen rather than to the right, as shown below.

4 System
4.4 User Interface

New screen added to the right (horizontal orientation)

New screen added below (vertical orientation)

The **2-Screen Orientation** switch allows you to choose between these two orientations for 2-Screen configurations. The default is the **HORizontal** configuration, two Screens side-by-side.

Remote Command	<code>:INSTrument:SCReen:ORientation VERTical HORizontal</code>
Example	<code>:INST:SCR:ORI VERT</code> Set the 2 screens to be above/below each other
Preset	<code>HOR</code> This is unaffected by Preset but is set to <code>HORizontal</code> by Restore User Interface Defaults or Restore System Defaults->All

4.4.15 Clock Format

Allows the **Clock Format** to be switched between 12-Hour Format (`HR12`) and 24-Hour Format (`HR24`).

Remote Command	<code>:SYSTem:DISPlay:CFORmat HR12 HR24</code> <code>:SYSTem:DISPlay:CFORmat?</code>
Example	<code>:SYST:DISP:CFOR HR12</code>
Preset	<code>HR12</code>
State Saved	Power On Persistent (survives shutdown and restart)
Range	12-Hour 24-Hour

4.4.16 Language

Accesses the selection of **Language** displayed on the menus and controls. `ENGLISH` is the default.

All Measurement Applications that share common controls will display the localized controls.

The description on the control labels is bounded by the control size. Any given language will have labels in that language that are shorter or longer than the equivalent label in English. Any localized text on the controls that does not fit the label size remains in English. Thus, for any given menu, controls may be displayed in English *and* the selected language.

- Labels that are acronyms, engineering, or technology specific terms may remain in English.
- All Application and Measurement names remain in English.
- All data in exported files remain in English.
- The Diagnostic and Service menus in the System Subsystem remain in English.

4 System
4.4 User Interface

- The Windows operating system must remain in English. Changing the **Region and Language** settings in the Windows Control Panel is not supported.

External keyboards in English are supported. Localized external keyboards are not supported. When the language selected is not English, a message is displayed to explain that any external keyboard must remain in English.

Other aspects of the Graphical User Interface remain in English. The Remote User Interface (SCPI) remains in English.

Remote Command	<code>:SYSTem:DISPlay:LANGuage ENGLISH RUSSian</code> <code>:SYSTem:DISPlay:LANGuage?</code>
Example	<code>:SYST:DISP:LANG ENGL</code> <code>:SYST:DISP:LANG RUSS</code> Requires Option AKT
Preset	This is unaffected by Preset but is set to ENGLISH by Restore User Interface Defaults , Restore Misc Defaults or Restore System Defaults →All

4.4.17 Restore User Interface Defaults

Causes the group of settings associated with the **User Interface** menu to be reset to their default values. This also happens on **Restore Misc Defaults**.

When **User Interface** is selected, a message appears saying:

`This will reset all of the User Interface variables to their default state, including the menu panel location, display theme, and language.`

`It will not affect Alignment data or settings.`

`This action cannot be undone. Do you want to proceed?`

The message provides **OK** and **Cancel** buttons for you to affirm or cancel the operation.

Example	<code>:SYST:DEF UINT</code>
---------	-----------------------------

4.4.18 User Interface Type (Remote Query Only)

Use this query to determine if the instrument is running the Multi-Touch user interface or Softkey user interface. This is an easy way to distinguish between A-models (Softkey) instruments and Touch UI (Multi-Touch) instruments.

Remote Command	<code>:DISPlay:UINTErface:TYPE?</code>
Example	<code>:DISP:UINT:TYPE?</code>

Notes The query returns **MULTITOUCH** for instruments with the Multi-Touch UI or **SOFTKEY** for instruments with the Softkey UI

4.5 Power On

Enables you to select how the instrument should power on.

NOTE

In products that run multiple instances of the X-Series Application, the same Power On type is shared between all the instances.

4.5.1 Power On State

Enables you to select whether the instrument powers up in a default state, or some other state. The options are:

- **MODE** and Input/Output Defaults
- **USER** Preset
- **LAST** State

Remote Command	<code>:SYSTem:PON:TYPE MODE USER LAST</code> <code>:SYSTem:PON:TYPE?</code>
Example	<code>:SYST:PON:TYPE MODE</code> <code>:SYST:PON:TYPE USER</code> <code>:SYST:PON:TYPE LAST</code>
Preset	This is unaffected by Preset but is set to MODE by Restore System Defaults->All
State Saved	No
Backwards Compatibility SCPI	<code>:SYSTem:PON:TYPE PRESet</code> the PRESet parameter is supported for backward compatibility only, and behaves the same as MODE

Mode and Input/Output Defaults

When the instrument is powered-on in **MODE** and Input/Output Defaults, it performs a **Restore Mode Defaults** to all modes in the instrument and performs a **Restore Input/Output Defaults**.

Persistent parameters (such as Amplitude Correction tables or Limit tables) are not affected at power-on, even though they are normally cleared by **Restore Input/Output Defaults** and/or **Restore Mode Defaults**.

User Preset

Sets **Power On State** to **USER** Preset. When the instrument is powered on in User Preset, it will **User Preset** each mode and switch to the "**Power On Application**" on page 2730. Power On User Preset does not affect any settings other than those set by a normal **User Preset**.

Backward Compatibility Note: Power On: User Preset causes the instrument to power up in the "**Power On Application**" on page 2730, *not* the last mode the instrument was in prior to shutdown. Also, Power On: User Preset will **User Preset** all modes. This does not exactly match legacy behavior.

NOTE

In products that run multiple instances of the X-Series Application, the same User Preset is shared between all the instances.

NOTE

An instrument could never power up for the first time in USER Preset.

Last State

Sets **Power On State** to **LAST**. When the instrument is powered on, it will put all modes in the last state they were in prior to when the instrument was put into Power Standby, and it will start up in the mode it was last in prior to powering off the instrument. The saving of the active mode prior to shutdown happens behind the scenes when a controlled shutdown is requested, either via the front panel **Standby** key, or the remote command **:SYSTem:PDOWn**. The non-active modes are saved as they are deactivated and recalled by Power On: Last State.

Power On: Last State only works if you completed a controlled shutdown prior to powering on in **LAST**. If a controlled shutdown is not completed when in Power On: Last State, the instrument will power up in the last active mode, but it may not power up in the active mode's last state. If an invalid mode state is detected, a **Mode Preset** will occur. To control the shutdown under remote control, use **:SYSTem:PDOWn**.

Backwards Compatibility Note: It is no longer possible to power-up the instrument in the last mode the instrument was running with that mode in the preset state. (ESA/PSA SYST:PRESET:TYPE MODE with SYST:PON:PRESET) You can power-on the instrument in the last mode the instrument was running in its last state (**:SYST:PON:TYPE LAST**), or you can specify the mode to power-up in its preset state (**:SYST:PON:MODE <mode>**).

NOTE

In products that run multiple instances of the X-Series Application, each instance has a unique Last State.

NOTE

An instrument can never power up for the first time in **LAST**.

If line power to the instrument is interrupted, for example by pulling the line cord plug or by switching off power to a test rack, Power On Last State may not work properly. For proper operation, Power On Last State depends on your shutting down the instrument using the **Standby** key or the `:SYSTem:PDOWn` SCPI command. This ensures the last state of each mode is saved and can be recalled during a power up.

4.5.2 Power On Application

Accesses a menu that lists the available Modes, and lets you select which Mode is to be the **Power On Application**. Whichever application is selected runs at power on when the Power On Type is set to “**MODE** and Input/Output Defaults”.

NOTE

In products that run multiple instances of the X-Series Application, the same Power On Application is shared between all the instances.

Remote Command	<code>:SYSTem:PON:MODE <mode></code> where <code><mode></code> is an item from the same set that can be sent using the <code>:INSTRument[:SElect]</code> command <code>:SYSTem:PON:MODE?</code>				
Example	<code>:SYST:PON:MODE SA</code>				
Notes	The list of possible modes (and remote parameters) to choose from is dependent on which modes are installed in the instrument				
Preset	This is unaffected by Preset but is set by Restore System Defaults->All to SA , except in the cases noted below:				
	<table border="1"> <tr> <td>N8973B, N8974B, N8975B, N8976B</td> <td>NFIG</td> </tr> <tr> <td>VXT models</td> <td>BASIC</td> </tr> </table>	N8973B, N8974B, N8975B, N8976B	NFIG	VXT models	BASIC
N8973B, N8974B, N8975B, N8976B	NFIG				
VXT models	BASIC				
State Saved	No				

4.5.3 FPGA Configuration

Lets you choose which FPGA image you want loaded into the instrument.

Depending on your hardware configuration, your instrument may contain a Field Programmable Gate Array (FPGA) which handles much of the processing for some of the mathematically intensive features, such as Time Domain Scan (option TDS) and Enhanced Sweep Speed (option FS2). The FPGA is not big enough to hold the

functionality for both options, so you must decide which FPGA program you want loaded.

When licenses allow for both FPGA image versions to be available, and you have not explicitly chosen an FPGA image version, then, when the firmware is updated, the Time Domain Scan version will be loaded. In the absence of all licenses, the Enhanced Sweep Speed version will be loaded. Once you have explicitly chosen an FPGA image version, using the FPGA Configuration dialog, any future firmware updates will continue to load the chosen version as long as it is licensed.

Example: loading the Time Domain Scan FPGA image, removing the TDS license, and then updating the firmware will result in the Enhanced Sweep Speed version being loaded.

When multiple capabilities are licensed, the FPGA Configuration presents a dialog that tells you that there is insufficient space to fit all the licensed capabilities, and asks you to choose one of the FPGA programs (images).

If you remove licenses, it is possible to end up with an unlicensed capability loaded in the FPGA while a licensed capability is not loaded. In this case, the dialog does not present the Preference group and shows a message about unlicensed/licensed capabilities. You can dismiss the dialog if the licensed capability is not currently needed, and you do not want to take the time to load the licensed FPGA image. However, this dialog will continue to appear each time the instrument is restarted.

Behavior when the Enhanced Sweep Speed FPGA Image is Loaded

When the Enhanced Sweep Speed version of the FPGA image is loaded, sweep behavior still depends on the licenses:

- FS2 gives full FPGA enhanced sweep speed
- FS1 gives software implemented enhanced sweep speed
- Neither FS1 nor FS2 – no enhanced sweep speed
- Both FS1 and FS2 – same as FS2, the full FPGA enhanced sweep speed

If the EMI Receiver application and TDS option are licensed and the Enhanced Sweep Speed FPGA image is loaded, then you will not have the proper FPGA image loaded to fully support the EMI Receiver application. In particular, the Frequency Scan measurement cannot use the Scan Type of “Time Domain Scan” (this is the normally the default Scan Type for instruments with the TDS option). Instead, the EMI Receiver Application will behave as if the TDS option is not licensed.

Behavior when the Time Domain Scan FPGA Image is loaded

When the Time Domain Scan version of the FPGA image is loaded, The EMI Receiver application will work as expected with the TDS option licensed, but the FS2 capability will silently revert to FS1 behavior.

Switching Between Enhanced Sweep Speed and Time Domain Scan FPGA Images

You can't have both full TDS and FS2 images at the same time, so to switch to the other image you must go through the process of reloading the FPGA by choosing the desired image with the Selected FPGA control and pressing Load FPGA or issuing the "Load FPGA" SCPI command below with the proper parameter.

Incorrect FPGA Configuration

If the EMI Receiver application, TDS, or FS2 license is removed while the FPGA image for that license is loaded, the instrument ends up in an incorrect configuration since the loaded FPGA image version has support for unlicensed functionality that is not accessible and does not support the currently licensed functionality. It will still function, but when the instrument recognizes this situation at startup, it will automatically enter the FPGA Configuration dialog. The only selections available will be the licensed ones, but you can choose to dismiss the dialog and continue with the current FPGA image version if you do not want to take the time to load the correct FPGA image. The dialog will continue to be presented at each startup until the correct FPGA image is loaded.

FPGA Updates When Firmware Installs

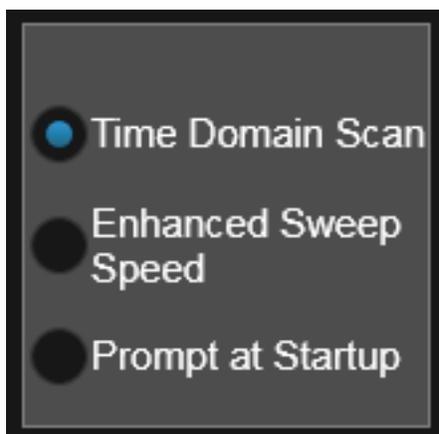

The FPGA image and X-Series firmware are tightly coupled, so whenever the firmware is updated, the FPGA image is also checked and updated if needed. The rules for choosing between Time Domain Scan and Enhanced Sweep Speed versions of the FPGA image are as:

1. Always use Time Domain Scan FPGA image for MXE
2. If neither the EMC Application nor TDS nor FS2 are licensed, the Enhanced Sweep Speed FPGA image is loaded
3. If EMC Application and TDS are licensed and FS2 is not licensed, the Time Domain Scan FPGA image is loaded
4. If EMC Application and TDS are not licensed and FS2 is licensed, the Enhanced Sweep Speed FPGA image is loaded
5. If all are licensed
 - a. If the FPGA Configuration Preference is Time Domain Scan, the Time Domain Scan FPGA image is loaded
 - b. If the FPGA Configuration Preference is Enhanced Sweep Speed, the Enhanced Sweep Speed FPGA image is loaded
 - c. If FPGA Configuration Preference is Prompt

- a. If the last FPGA Configuration Load was Time Domain Scan, the Time Domain Scan FPGA image is loaded
- b. If the last FPGA Configuration Load was Enhanced Sweep Speed, the Enhanced Sweep Speed FPGA image is loaded
- c. If no FPGA has been explicitly loaded, the Time Domain Scan FPGA image is loaded

4.5.3.1 FPGA Load Preference

You may choose one image or the other from the radio buttons at the top of the dialog:

If you select the image that is already loaded, you will not be prompted again. If you select a different one, the Selected FPGA control changes to that one and you must then press the **Load FPGA** control to load the other image.

When installing new firmware, the **FPGA Load Preference** setting is used to load the preferred FPGA image version if more than one version is available. Selecting **Prompt at Startup** causes you to be prompted at each startup to select the desired version of the FPGA image.

Remote Command	<code>:SYSTem:PON:FPGA:PREference TDS FS2 PROMpt</code>
Example	<code>:SYST:PON:FPGA:REF TDS</code> <code>:SYST:PON:FPGA:REF?</code>
Notes	<ul style="list-style-type: none"> - TDS = Load the Time Domain Scan version of the FPGA image - FS2 = Load the Enhanced Sweep Speed version of the FPGA image - PROMpt = Prompt at each startup, show the FPGA Configuration dialog. The user can choose to continue with the currently loaded FPGA image version or load a different version

This SCPI is always available, but if the hardware does not support multiple FPGA image choices, the value will always be:

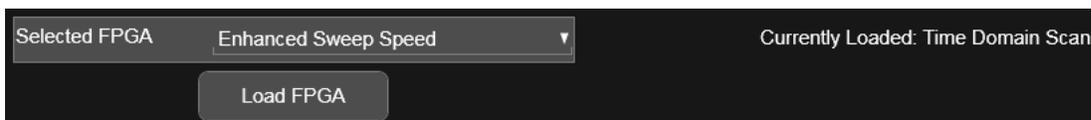

- **NA** = Not available for this hardware

Also, when not supported, any attempt to change away from **NA** results in the error -224, "Illegal parameter value"

Dependencies	Dialogs and menus available only when EMC Application, TDS and FS2 are all licensed
Preset	PROMpt Not affected by Mode Preset but set to PROMpt by Restore System Defaults > All or Power On

4.5.3.2 Load FPGA

Depending on the "**FPGA Load Preference**" on page 2733 selection, there may be a mismatch between the desired FPGA image, and the one that is currently loaded. In that case the **Load FPGA** control at the bottom of the dialog will not be grayed-out, and you must press it to actually load the desired FPGA image. The image that is currently loaded is shown on the right:

If you have a mismatch, but don't actually load the other image, the **FPGA Load Preference** will be remembered, but the image you had before will remain until you return to this dialog and press **Load FPGA**, or until the next time the instrument firmware is updated.

If you press **Load FPGA**, the X-series software exits, the FPGA update program runs, and the instrument reboots. After rebooting, the new image will be loaded in the FPGA.

NOTE This can take 15 minutes or more.

CAUTION If power is lost during the FPGA load process, the FPGA can become corrupted, in which case the only solution is to return it to Keysight for servicing.

Remote Command	:SYSTem:PON:FPGA:LOAD TDS FS2
Example	:SYST:PON:FPGA:LOAD TDS :SYST:PON:FPGA:LOAD?
Notes	If the specified FPGA image version is the one already loaded, then the command does nothing. If the FPGA image needs to change, the analyzer software exits (terminating the SCPI session), and the FPGA update utility is launched. Once the FPGA has updated, the instrument will reboot This SCPI is always available, but if the hardware does not support multiple FPGA image choices, the

	<p>value returned will always be: NA = Not available for this hardware Also, when not supported, any attempt to change away from NA results in the error -224, "Illegal parameter value"</p>
Dependencies	<p>Available only when there are multiple versions of the FPGA image that could be loaded Selection limited to licensed features:</p> <ul style="list-style-type: none"> - TDS selection requires the EMC Application and the TDS hardware option - FS2 requires the FS2 hardware option <p>The UI is blanked when there is only one licensed selection, and that selection is already loaded. Sending the SCPI for an unlicensed selection results in error: -224, "Illegal parameter value; <option> is not licensed"</p>
Preset	None. Not affected by Mode Preset or any Restore Defaults

4.5.4 Restore Power On Defaults

This selection causes the **Power On** settings to be reset to their default values.

When this button is pressed, a message appears saying:

This will reset Power On State and Power On Application to their default state.

It will not affect Alignment data or settings.

This action cannot be undone. Do you want to proceed?

The message provides **OK** and **Cancel** buttons for you to affirm or cancel the operation.

Example `:SYST:DEF PON`

4.5.5 Configure Applications – Desktop application

The **Configure Applications** utility runs from the instrument's desktop. You must close the Instrument Application before running **Configure Applications**.

This utility can be used to:

- select applications for preload
- determine how many applications can fit in memory at one time
- specify the order of the Modes in the Mode menu.

The utility consists of a window with instructions, a set of **Select Application** checkboxes, a “fuel bar” style memory gauge, and keys that help you set up your configuration.

NOTE

In products that run multiple instances of the X-Series Application, the same Configure Applications Utility is shared between all the instances.

For more information, see the following topics:

- ["Preloading Applications" on page 2736](#)
- ["Access to Configure Applications utility" on page 2736](#)
- ["Virtual memory usage" on page 2738](#)

Example

`:SYST:SHOW CAPP`

Displays the Config Applications screen

Preloading Applications

During runtime, if a Mode that is not preloaded is selected using the **Mode** menu or by sending SCPI commands, there will be a pause while the Application is loaded. During this pause a message that says “**Loading application, please wait ...**” is displayed. Once loaded, the application stays loaded, so the next time you select it during a session, there is no delay.

Preloading enables you to “preload” at startup, to eliminate the runtime delay. Preloading an application causes it to be loaded into the instrument’s memory when the analyzer program starts up. If you do this, the delay will increase the time it takes to start up the analyzer program, but this may be preferable to having to wait the first time you select an application. Note that, once an application is loaded into memory, it cannot be unloaded without exiting and restarting the analyzer program.

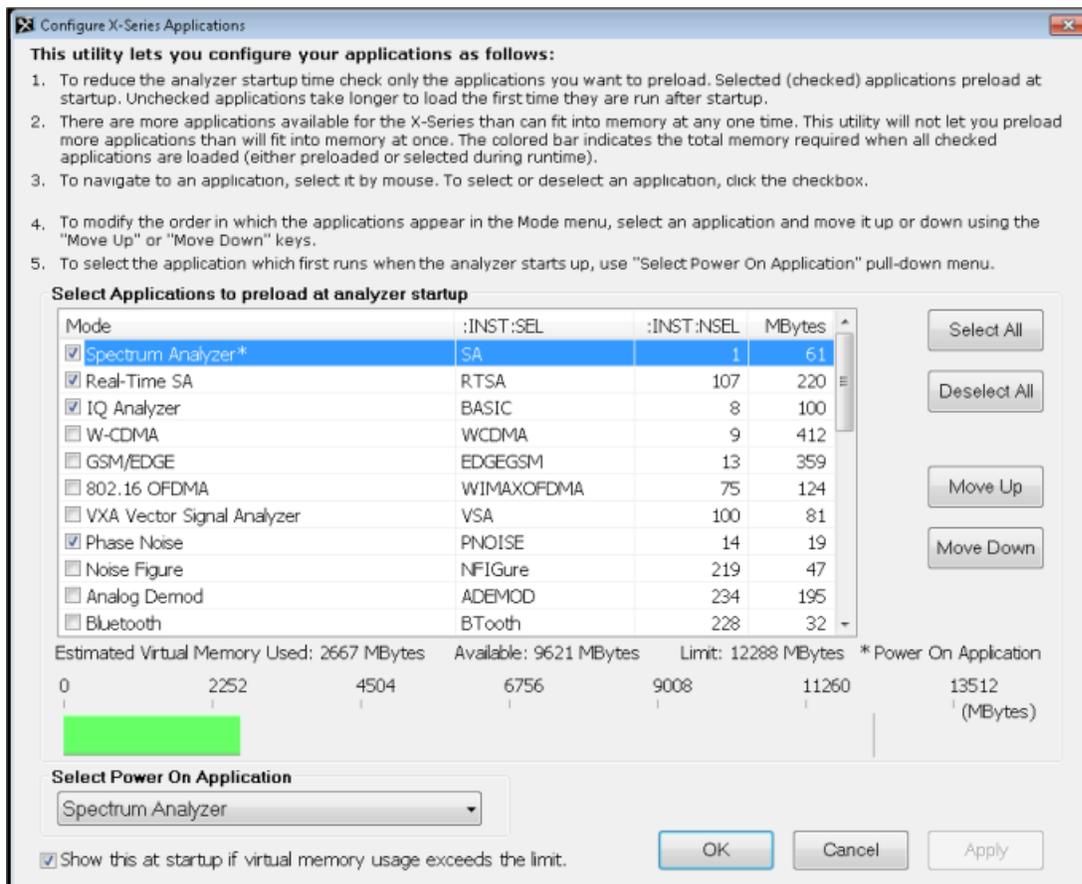

Note that there are more applications available for the X-Series than can fit into Windows Virtual Memory. By allowing you to choose which licensed applications to load at startup, the **Configure Applications** utility allows you to make optimal use of the instrument memory.

Access to Configure Applications utility

A version of the utility runs the first time you power up the instrument after purchasing it from Keysight. The utility automatically configures preloads so that as many licensed applications as possible are preloaded while keeping the total estimated virtual memory usage below the limit. This auto-configuration only takes place at the very first run, and after analyzer software upgrades.

At any time, you can manually start the **Configure Applications** utility by closing the analyzer application and double-tapping the **Configure Applications** icon on the desktop.

The utility's main dialog looks like this:

Instructions are provided below and on the utility. Use the utility to find a configuration that works best for you, and then restart the analyzer program.

- Select All** Marks all applications in the selection list. This allows you to enable all applications licensed on the instrument for pre-loading, or is a convenience for selecting all applications in one operation and then letting you deselect individual applications
- Deselect All** Clears the marks from all applications in the selection list, except the Power On application. The Power On application cannot be eliminated from the pre-load list
- Move Up** The application list is the order that applications appear in the Mode Menu. These keys enables you to shift the selected application up or down in the list, thus moving the selected application earlier or later in the Mode Menu
- Move Down**
- Select Power On Application** This is the same as the "Power On Application" selection on the Power On page of the System Settings dialog

Virtual memory usage

There are more applications available for the X-Series than can fit into memory at any one time, so the **Configure Applications** utility includes a memory tracker that serves two purposes:

1. It will not let you preload more applications than will fit into memory at once.
2. You can determine how many of your favorite applications can reside in memory at one time.

The utility provides a graphical representation of the amount of memory (note that the amount of memory shown here is *virtual* memory, which is a limitation imposed by the operating system, not by the amount of physical memory you have in your instrument). You select applications to preload by checking the boxes on the left. Checked applications preload at startup. The colored fuel bar indicates the total memory required when all the checked applications are loaded (either preloaded or selected during runtime).

Here is what the fuel bar colors mean:

- RED: the applications you have selected cannot all fit into the instrument's memory. You must deselect applications until the fuel bar turns yellow.
- YELLOW: the applications you have selected can all fit into the instrument's memory, but there is less than 10% of the memory left, probably not enough to load any other applications, either via preload or by selecting a Mode while the instrument is running..
- GREEN: The indicator is green when <90% of the memory limit is consumed. This means the applications you have selected can all fit into the instrument's memory with room to spare. You will be able to load one or more other applications without running out of memory.

All apps that are part of the Sequencer Mode (GSM/EDGE, WCDMA, CDMA2K and 1xEVDO) will be preloaded (if licensed) if Sequence Analyzer is selected to be preloaded.

4.5.6 Configure Applications - Instrument boot-up

When the Instrument Application starts, a dialog box similar to the one you see when you run **Configure Applications** is displayed, allowing you to choose which licensed applications are to be loaded. This dialog is only displayed if the memory required to pre-load all the licensed applications exceeds the virtual memory available.

4.5.7 Configure Applications - Remote Commands

The following topics provide details on using remote commands to configure the list of applications you want to load into the instrument memory, or query the virtual memory utilization for your applications.

- "Configuration list (Remote Command Only)" on page 2739
- "Configuration Memory Available (Remote Command Only)" on page 2739
- "Configuration Memory Total (Remote Command Only)" on page 2740
- "Configuration Memory Used (Remote Command Only)" on page 2740
- "Configuration Application Memory (Remote Command Only)" on page 2740

4.5.7.1 Configuration list (Remote Command Only)

Used to set or query the list of applications to be loaded in-memory.

Remote Command	<code>:SYSTem:PON:APPLication:LLISt <string of INSTRument:SElect names></code> <code>:SYSTem:PON:APPLication:LLISt?</code>
Example	<code>:SYST:PON:APPL:LLIS "SA,BASIC,WCDMA"</code>
Notes	<code><string of INSTRument:SElect names></code> contains items that are valid options for the <code>:INSTRument:SElect</code> command The order of the <code><INSTRument:SElect names></code> specifies the order in which the applications are loaded into memory, and the order that they appear in the Mode menu Error message -225 "Out of Memory" is reported when more applications are listed than can reside in virtual memory. When this occurs, the existing applications load list is unchanged
Preset	Not affected by Preset
State Saved	Not saved in instrument state

4.5.7.2 Configuration Memory Available (Remote Command Only)

Used to query the amount of Virtual Memory remaining.

Remote Command	<code>:SYSTem:PON:APPLication:VMEMory[:AVAIlable]?</code>
Example	<code>:SYST:PON:APPL:VMEM?</code>
Preset	Not affected by Preset

4.5.7.3 Configuration Memory Total (Remote Command Only)

Used to query the limit of Virtual Memory allowed for applications.

Remote Command	<code>:SYSTem:PON:APPLication:VMEMory:TOTal?</code>
Example	<code>:SYST:PON:APPL:VMEM:TOT?</code>
Preset	Not affected by Preset

4.5.7.4 Configuration Memory Used (Remote Command Only)

Queries of the amount of Virtual Memory used by all measurement applications.

Remote Command	<code>:SYSTem:PON:APPLication:VMEMory:USED?</code>
Example	<code>:SYST:PON:APPL:VMEM:USED?</code>
Preset	Not affected by Preset

4.5.7.5 Configuration Application Memory (Remote Command Only)

Queries the amount of Virtual Memory a particular application consumes.

Remote Command	<code>:SYSTem:PON:APPLication:VMEMory:USED:NAME? <INSTRument:SElect name></code>
Example	<code>:SYST:PON:APPL:VMEM:USED:NAME? CDMA2K</code>
Notes	<code><INSTRument:SElect name></code> is an item from the same set used by the <code>:INSTRument:SElect</code> command If the name provided is invalid, 0 (zero) is returned
Preset	Not affected by Preset

4.6 Restore Defaults

Provides initialization of system setting groups, including the option to set the entire instrument back to a factory default state.

NOTE

In products that run multiple instances of the X-Series Application, all instances have the same factory default states for **Restore Defaults**.

Remote Command	<code>:SYSTem:DEFault [ALL] ALIGn INPut MISC MODes PON UINTerface SCReen</code>
Example	<code>:SYST:DEF</code>
State Saved	No

4.6.1 Input/Output

Input/Output Preset resets the group of settings and data associated with the **Input/Output** front-panel key to their default values. These settings are not affected by a **Mode Preset** because they are associated with connections to the instrument, which you will probably not want to reset every time you press **Mode Preset**.

By using **Input/Output Preset** and **Restore Mode Defaults**, a full preset of the current mode will be performed, with the caveat that since **Input/Output Preset** is a global function, it will affect *all* modes.

This is the same as the **Input/Output Preset** button in the **Preset** dropdown and the **Input/Output** menu.

When **Input/Output** is selected, a message appears saying:

`This will reset all of the Input/Output variables to their default state, including which input is selected, all Amplitude Correction settings and data, all External Mixing settings, all Frequency Reference settings and all Output settings`

`It will not affect Alignment data or settings`

`This action cannot be undone. Do you want to proceed?`

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

Example	<code>:SYST:DEF INP</code>
---------	----------------------------

4.6.2 I/O Config

Causes the group of settings associated with the **I/O Config** menu to be reset to their default values. This also happens on **Restore Misc Defaults**, which has a SCPI command, although **I/O Config** does not.

When **I/O Config** is selected, a message appears saying:

```
This will reset all of the I/O Config variables to their default state,  
including the GPIB address and SCPI LAN settings
```

```
It will not affect Alignment data or settings
```

```
This action cannot be undone. Do you want to proceed?
```

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

4.6.3 User Interface

Causes the group of settings associated with the **User Interface** menu to be reset to their default values. This also happens on a **Restore Misc Defaults**.

When **User Interface** is selected, a message appears saying:

```
This will reset all of the User Interface variables to their default state,  
including the menu panel location, display theme, and language
```

```
It will not affect Alignment data or settings
```

```
This action cannot be undone. Do you want to proceed?
```

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

Example `:SYST:DEF UINT`

4.6.4 Power On

Causes the **Power On** settings to be reset to their default values.

The Power On settings are **Power On State** and **Power On Application**.

When **Power On** is selected, a message appears saying:

```
This will reset Power On State and Power On Application to their default  
state
```

```
It will not affect Alignment data or settings
```

```
This action cannot be undone. Do you want to proceed?
```

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

Example `:SYST:DEF PON`

4.6.5 Alignments

Causes the **Alignments** system settings to be reset to their default values. This does not affect any Alignment data stored in the system.

After performing this function, it may impact the auto-alignment time of the instrument until a new alignment baseline has been established.

When **Alignments** is selected, a message appears saying:

`This will reset all of the settings for the Alignment system to their default values`

`No alignment data will be erased`

`This action cannot be undone. Do you want to proceed?`

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

Example `:SYST:DEF ALIG`

4.6.6 Misc

Causes miscellaneous system settings to be reset to their default values.

CAUTION This function resets the GPIB address to 18.

When **Misc** is selected, a message appears saying:

`This will reset miscellaneous system settings to their default values. This includes settings for I/O Config (GPIB and SCPI LAN), the User Interface, the Save/Recall system, and the Preset type`

`It will not affect Alignment data or settings`

`This action cannot be undone. Do you want to proceed?`

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

This Miscellaneous group contains settings that are *not* part of the other Restore System Defaults groups. These include:

- All settings on the **I/O Config** page of the **System Settings** dialog
- All settings in the following table:

Miscellaneous Setting	Default Value
The SYST:PRES:TYPE	MODE
Auto File Name Number	000
Save Type	State
State Save To	Register 1
Screen Save To	SCREEN000.png
Save/Recall Shortcuts	Deleted
Display Theme	Filled
Backlight	ON
System Annotation	Local Settings
Language	English
DISP:ENABle	ON
Full Screen	Off

Example `:SYST:DEF MISC`

4.6.7 All

Comprehensively resets **All** instrument settings to their factory default values. It resets all the **System Settings** groups, performs **Restore Mode Defaults** for all modes in the instrument, and switches back to the power-on mode. It does not affect the User Preset file, or any user saved files.

When **All** is selected, a message appears saying:

This will reset all of the settings in the instrument to their factory default values, including the state of all Modes and Screens, the GPIB settings, the Alignment settings, and the Power On Mode

It will not affect Alignment data or settings

This action cannot be undone. We recommend canceling this operation and restoring settings individually (I/O Config, User Interface, Alignments, etc.) instead

Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

NOTE

If you are using a Keysight USB External Mixer, then you will need to perform **Refresh USB Mixer Connection** after Restoring All Defaults.

Example `:SYST:DEF ALL`

Notes If using a Keysight USB External Mixer, perform **Refresh USB Mixer Connection** (SCPI command

	<code>:MIX:BAND USB</code>) following Restore All Defaults
Couplings	All causes the currently running measurement to be aborted, and sets all modes to a consistent state, so it is unnecessary to couple any settings
Example	<code>:SYST:PRES:PERS</code>
Notes	<code>:SYST:PRES:PERS</code> is the same as <code>:SYST:DEF ALL</code>
Backwards Compatibility SCPI	<code>:SYSTem:PRESet:PERsistent</code>

4.7 Alignments

Accesses the alignment system of the instrument. You can control the automatic alignments, view alignment statistics and manually perform alignments.

The current setting of the alignment system is displayed in the Meas Bar along the top of the display. For conditions that may cause specifications to be impacted, this annotation will be in amber.

4.7.1 Auto Align

Lets you configure the automatic background alignments and the alerts from the automatic alignment system.

Dependencies	Does not appear in VXT
--------------	------------------------

4.7.1.1 Auto Align

Configures the method the automatic background alignment will use when it runs.

Automatic background alignments are run periodically between measurement acquisitions. The instrument's software determines when alignments are to be performed to maintain warranted operation. The recommended setting for Auto Align is Normal.

Auto Align execution *cannot* be aborted with the **Cancel (ESC)** key. To interrupt **Auto Align** execution, select **Auto Align Off**.

Remote Command	<code>:CALibration:AUTO ON LIGHT PARTial OFF</code>
----------------	---

For details of each option, see ["Auto Align Options" on page 2747](#)

`:CALibration:AUTO?`

Example	<code>:CAL:AUTO ON</code>
---------	---------------------------

Notes	While Auto Align is executing, bit 0 of Status Operation register is set
-------	--

Couplings	Auto Align is set to Off if Restore Align Data is invoked
-----------	---

Preset	This is unaffected by Preset but is set to ON by Restore System Defaults->Align
--------	---

State Saved	No
-------------	----

Annotation	In the Meas Bar:
------------	------------------

- Normal with "All But RF" off: Auto (white)
- Normal with "All But RF" on: Auto/No RF (amber)
- Partial: Partial (amber)

	- Off: Off (amber)
Status Bits/OPC dependencies	When Auto Align is executing, Bit 0 in the Status Operational register is set An interfering signal at the RF Input may prevent automatic alignment of the RF subsystem. If this occurs, the Error Condition message “Align RF skipped” is reported, the Status Questionable Calibration bit 11 is set, and the alignment proceeds. When a subsequent alignment of the RF subsystem succeeds, either by the next cycle of automatic alignment or from an Align Now, RF, the Error Condition and Status Questionable Calibration bit 11 are cleared
Backwards Compatibility SCPI	:CALibration:AUTO ALERT Parameter ALERT is for backwards compatibility only, and is mapped to PARTial

Auto Align Options

The available settings for Auto Align are as follows:

Normal

SCPI example **:CAL:AUTO ON**

Auto Align, Normal turns on the automatic alignment of all measurement systems. This selection maintains the instrument in warranted operation across varying temperature and over time.

If the condition “Align Now All required” is set, transitioning to **Auto Align, Normal** performs the required alignments, clears the “Align Now All required” condition, then continues with further alignments as required to maintain the instrument adequately aligned for warranted operation.

When **Auto Align, Normal** is selected, the **Auto Align Off** time is set to zero.

When **Auto Align, Normal** is selected, the Meas Bar indicates Align: Auto (in white) or Align: Auto/No RF (in amber). The amber color reminds you that you are responsible for maintaining the RF alignment of the instrument.

Alignment processing because of the transition to **Normal** is executed sequentially. Thus, ***OPC?** or ***WAI** following **:CAL:AUTO ON** will return when the alignment processing is complete.

Light

SCPI example **:CAL:AUTO LIGH**

Auto Align, Light turns on the automatic alignment of all measurement systems. The **Auto Align, Light** selection allows more drift in amplitude accuracy to allow much less frequent measurement interruptions to perform alignments. The temperature changes required to trigger each alignment are increased by a factor of three. Alignments also expire from time as well as temperature. In a stable

thermal environment, the alignments occur one-ninth as often as in Normal. With these less frequent alignments, all accuracy specifications (those expressed with $\pm x$ dB tolerances) change by nominally a factor of 1.4.

If the condition “Align Now, All required” is set, transitioning to **Auto Align, Light** performs the required alignments, clears the “Align Now, All required” condition, and continues with further alignments as required to maintain the instrument adequately aligned for warranted operation.

Alignment processing because of the transition to **Light** is executed sequentially. Thus, ***OPC?** or ***WAI** following **:CAL:AUTO LIGHT** will return when the alignment processing is complete.

When **Auto Align, Light** is selected, the **Auto Align Off** time is set to zero.

When **Auto Align, Light** is selected, the Settings Panel indicates Align: Light.

Partial

SCPI example **:CAL:AUTO PART**

Auto Align, Partial disables the full automatic alignment and the maintenance of warranted operation for the benefit of improved measurement throughput. Accuracy is retained for the Resolution Bandwidth filters and the IF Passband, which is critical to FFT accuracy, demodulation, and many measurement applications. With Auto Align set to Partial, you are now responsible for maintaining warranted operation by updating the alignments when they expire. The Auto Align, Alert mechanism will notify you when alignments have expired. One solution to expired alignments is to perform the Align All, Now operation. Another is to return the Auto Align selection to Normal.

Auto Align, Partial is recommended for measurements where the throughput is so important that a few percent of improvement is more valued than an increase in the accuracy errors of a few tenths of a decibel. One good application of **Auto Align, Partial** would be an automated environment where the alignments can be called during overhead time when the device-under-test is exchanged.

When **Auto Align, Partial**, is selected the elapsed time counter begins for **Auto Align Off** time.

When **Auto Align, Partial** is selected, the Settings Panel indicates Align: Partial in an amber color. The amber color reminds you that you are responsible for maintaining the warranted operation of the instrument.

Off

SCPI example **:CAL:AUTO OFF**

Auto Align, Off disables automatic alignment and the maintenance of warranted operation, for the benefit of maximum measurement throughput. With **Auto Align**

set to **Off**, you are now responsible for maintaining warranted operation by updating the alignments when they expire. The Auto Align, Alert mechanism will notify you when alignments have expired. One solution to expired alignments is to perform the **Align All, Now** operation. Another is to return the **Auto Align** selection to **Normal**.

The **Auto Align Off** setting is rarely the best choice, because **Partial** gives almost the same improvement in throughput while maintaining the warranted performance for a much longer time. The choice is intended for unusual circumstances, such as the measurement of radar pulses where you might want the revisit time to be as consistent as possible.

When **Auto AlignOff** is selected, the **Auto Align Off** time is initialized and the elapsed time counter begins.

When **Auto AlignOff** is selected, the Settings Panel indicates Align: Off in an amber color. The amber color reminds you that you are responsible for maintaining the warranted operation of the instrument.

4.7.1.2 All but RF

Configures automatic alignment to include or exclude the RF subsystem. (Eliminating the automatic alignment of the RF subsystem prevents the input impedance from changing. The normal input impedance of 50 ohms can change to an open circuit when alignments are being used. Some devices under test do not behave acceptably under such circumstances, for example by showing instability.)

When **All but RF** is **ON**, the operator is responsible for performing an **Align Now RF** when RF-related alignments expire. The Auto Align, Alert mechanism will notify you to perform an **Align Now All** when the combination of time and temperature variation is exceeded.

When **All But RF** is **ON**, the Settings Panel indicates Align: Auto/No RF (in amber). The amber color reminds you that you are responsible for maintaining the RF alignment of the instrument.

Remote Command	<code>:CALibration:AUTO:MODE ALL NRF</code> <code>:CALibration:AUTO:MODE?</code>
Example	<code>:CAL:AUTO:MODE NRF</code>
Preset	This is unaffected by Preset but is set to ALL on Restore System Defaults->Align
State Saved	No

4.7.1.3 Alert

The instrument signals an **Alert** when conditions exist such that you will need to perform a full alignment (for example, **Align Now All**). Alert can be configured in one

4 System
4.7 Alignments

of four settings:

Setting	Option
Time & Temperature	TTEmperture
Time & Temperature Light	LIGHT
7 days	WEEK
None	NONE

With **Auto Align** set to **Normal**, the configuration of **Alert** is not relevant, because the instrument's software maintains the instrument in warranted operation.

A confirmation is required when a selection other than **TTEmperture** is chosen. This prevents accidental deactivation of alerts. When setting **Alert** from the front panel to any value but **TTEmperture**, confirmation is required to transition into this setting of Alert. The confirmation dialog is:

This will suppress alerts from the Alignment system, which would notify you when an Alignment is required to maintain warranted operation. Without the alerts you will be responsible for performing an Align Now All at appropriate intervals to maintain warranted operation

Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

No confirmation is required when **Alert** is configured through a remote command.

For more information see "[Time & Temperature](#)" on page 2750

Remote Command	<code>:CALibration:AUTO:ALERT TTEmperture LIGHT DAY WEEK NONE</code> <code>:CALibration:AUTO:ALERT?</code>
Example	<code>:CAL:AUTO:ALER TTEM</code>
Preset	This is unaffected by Preset but is set to TTEmperture on a "Restore Alignment Defaults"
State Saved	No
Status Bits/OPC dependencies	When an alert is generated, the condition message "Align Now All required" appears in the Status Bar, and bit 14 is set in the Status Questionable Calibration register

The settings for **Alert** are detailed below.

Time & Temperature

SCPI example `CAL:AUTO:ALER TTEM`

The instrument signals an alert when alignments expire due to the combination of the passage of time and changes in temperature. The alert is the Error Condition message "Align Now All required". If this choice for Alert is selected, the absence of an alert means that the instrument alignment is sufficiently up-to-date to maintain warranted accuracy.

Time & Temperature Light

SCPI example `CAL:AUTO:ALER LIGH`

This is a light version of Time & Temperature which means for this setting the time/temperature changes required to trigger an alert are increased by a factor of three and the time alerts will occur one-ninth as often as for Time and Temperature.

24 hours

SCPI example `CAL:AUTO:ALER DAY`

The instrument signals an alert after a time span of 24 hours since the last successful full alignment (for example, **Align Now All** or completion of a full **Auto Align**). You may want to select this option in an environment where the temperature is stable on a daily basis, at a small risk of accuracy errors in excess of the warranted specifications. The alert is the Error Condition message “Align Now All required”.

7 days

SCPI example `CAL:AUTO:ALER WEEK`

The instrument signals an alert after a time span of 168 hours since the last successful full alignment (for example, **Align Now All** or completion of a full **Auto Align**). You may want to select this option in an environment where the temperature is stable on a weekly basis, at a modest risk of accuracy degradations in excess of warranted performance. The alert is the Error Condition message “Align Now All required”.

None

SCPI example `CAL:AUTO:ALER NONE`

The instrument does not signal an alert. This is provided for rare occasions where you are making a long measurement that cannot tolerate **Auto Align** interruptions, and must have the ability to capture a screen image at the end of the measurement without an alert posted to the display. Keysight does not recommend using this selection in any other circumstances, because of the risk of accuracy performance drifting well beyond expected levels without the operator being informed.

4.7.2 Align Now

Accesses alignment processes that are immediate action operations. They perform complete operations and run until they are complete.

Executing immediate alignments from SCPI can be problematic due to the length of time required for the alignments to complete. Alignment commands are by their

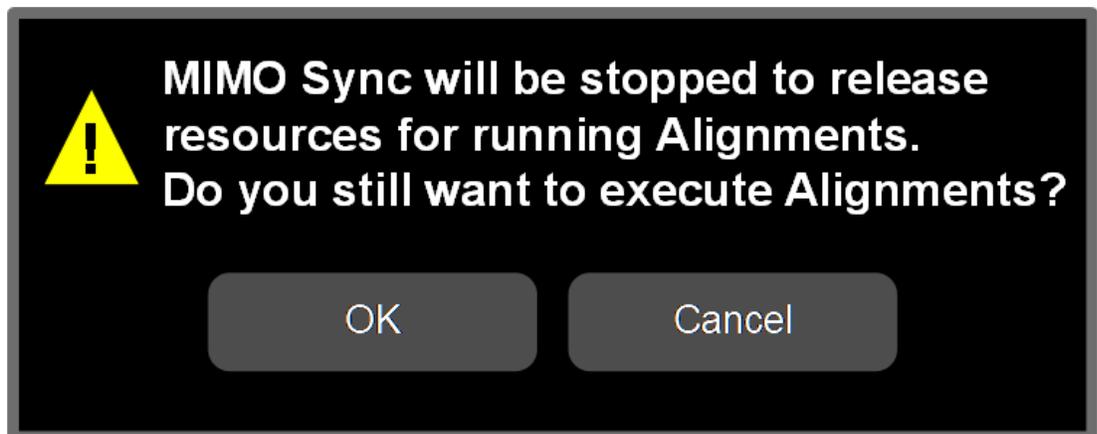

nature sequential, meaning they must complete before any other SCPI commands can be processed. In many cases the alignment itself will take longer than the typical SCPI timeout value. Furthermore, status cannot be easily queried while a sequential command is running.

For this reason, overlapped versions of the **Align Now** commands are provided. When using these No-Operation-Pending (**NPENDING**) commands, the SCPI thread will not be blocked (will be released immediately), so that you can use **:STATus:OPERation:CONDition?** to query the alignment status bit and use **:STATus:QUEStionable:CALibration:CONDition?** to check the alignment results. As an example, **:CALibration[:ALL]:NPENDING** is the overlapped replacement for **:CALibration[:ALL]**.

While the alignment is executing, the coming NOP calibration will be ignored, and error message “Setting Conflict, Alignment is in process” will be posted. Also, any other operations to the instrument will be pended and postponed until the alignment is completed. The operations include: Preset, Initiate a new measurement, Device clear and so on. Accordingly, changing parameters will not take effect although the UI is updated immediately. To avoid unexpected timeouts and results, these operations are not recommended during any such alignments.

NOTE

The Alignments will not be performed if the MIMO Sync is running. As the MIMO and Alignments require the same hardware resource. If the instrument is in MIMO Sync and you press a button to execute Alignments, a pop-up window appears as below. Click OK to stop MIMO and execute Alignments.

If the instrument is in MIMO sync, and you send a SCPI command to run Alignments, the align process will not be executed and a warning will be generated. To execute Alignments, you must first stop MIMO via SCPI (or manually).

Controls in this Dialog

The selection and order of controls displayed in this dialog depends on the instrument type and options. Select the control of interest from the following list:

- "Align Now All" on page 2753
- "Align Now All but RF" on page 2755
- "Align Now RF" on page 2757
- "Align Now Expired" on page 2758
- "Align Now Preselector" on page 2759
- "Align Now All but RF Preselector" on page 2760
- "Align Now RF Presel Only (20 Hz to 3.6 GHz)" on page 2760
- "Align Now External Mixer" on page 2761
- "Align Source" on page 2762
- "Align Receiver" on page 2763
- "Align Fast" on page 2763
- "Align LO Leakage" on page 2764
- "Align IF Cable" on page 2764
- "Align RRH Amplitude" on page 2765
- "Align LO Clock" on page 2765
- "Align Selected Freq Ranges" on page 2765
- "Align External Mixer Path" on page 2768
- "Align Low Band" on page 2769
- "Align High Band" on page 2769

4.7.2.1 Align Now All

In PXE, the key label is **Align Now All (plus RF Presel 20 Hz – 3.6 GHz)**

4 System

4.7 Alignments

Immediately executes an alignment of all subsystems. The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

If an interfering user signal is present at the RF Input, the alignment is performed on all subsystems except the RF. After completion, the Error Condition message “Align RF skipped” is generated. In addition, the Error Condition message “Align Now, RF required” is generated, and bits 11 and 12 are set in the Status Questionable Calibration register.

The query form of the remote commands (`:CALibration[:ALL]?` or `*CAL?`) invokes the alignment of all subsystems and returns a success or failure value. An interfering user signal is not grounds for failure; if the alignment was able to succeed on all portions but unable to align the RF because of an interfering signal, the resultant will be the success value.

Successful completion of **Align Now All** will clear the “Align Now All required” Error Condition, and clear bit 14 in the Status Questionable Calibration register. It will also begin the elapsed time counter for Last Align Now All Time, and capture the Last Align Now All Temperature.

If the Align RF subsystem succeeded in aligning (no interfering signal present), the elapsed time counter begins for Last Align Now, RF Time, and the temperature is captured for the Last Align Now, RF Temperature. In addition the Error Conditions “Align RF skipped” are cleared, the Error Condition “Align Now, RF required” is cleared, and bits 11 and 12 are cleared in the Status Questionable Calibration register.

Align Now All can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the `:ABORT` SCPI command. When this occurs, the Error Condition message “Align Now All required” is generated, and bit 14 is set in the Status Questionable Condition register. This is because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

In many cases, you might find it more convenient to change alignments to **Normal**, instead of executing **Align Now All**. When the Auto Align process transitions to **Normal**, the instrument will immediately start to update only the alignments that have expired, thus efficiently restoring the alignment process.

Remote Command	<code>:CALibration[:ALL]</code> <code>:CALibration[:ALL]?</code>
Example	<code>:CAL</code>
Notes	<code>:CALibration[:ALL]?</code> returns 0 if successful, or 1 if failed <code>:CALibration[:ALL]?</code> is the same as <code>*CAL?</code> While Align Now All is performing the alignment, the Calibrating bit (Bit 0 in the Status Operation register) is set. Completion, or termination, will clear Bit 0 in the Status Operation register This command is sequential; it must complete before further SCPI commands are processed.

	<p>Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the :ABORT command</p> <p>Successful completion will clear bit 14 in the Status Questionable Calibration register</p> <p>An interfering user signal is not grounds for failure of Align Now All. However, Bits 11 and 12 are set in the Status Questionable Calibration register to indicate Align Now, RF is required</p> <p>An interfering user-supplied signal will result in the instrument requiring an Align Now, RF with the interfering signal removed</p>
Couplings	<p>Initializes the time for the Last Align Now All Time</p> <p>Records the temperature for the Last Align Now All Temperature</p> <p>If Align RF component succeeded, initializes the time for the Last Align Now, RF Time</p> <p>If Align RF component succeeded, records the temperature for the Last Align Now, RF Temperature</p>
Status Bits/OPC dependencies	Bits 11, 12, or 14 may be set in the Status Questionable Calibration register
Remote Command	*CAL?
Example	*CAL?
Notes	<p>Returns 0 if successful, or 1 if failed</p> <p>:CALibration[:ALL]? is exactly the same as *CAL?, including all conditions, status register bits, and couplings</p> <p>See additional remarks described with :CALibration[:ALL]?</p>
Remote Command	:CALibration[:ALL]:NPENding
Example	:CAL:NPEN
Notes	<p>:CALibration[:ALL]:NPENding is the same as :CALibration[:ALL], including all conditions, status register bits, except this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> 1. :CALibration:ALL:NPENding (Start a calibration) 2. :STATus:OPERation:CONDition? (Check if the calibration is completed or not, If bit 0 is set, then the system is doing calibration, you should repeat this SCPI query until the bit is cleared) 3. :STATus:QUESTionable:CALibration:CONDition? (Check if there are any errors/failures in previous calibration procedure)

4.7.2.2 Align Now All but RF

In PXE, the key label is **Align Now All but RF (not including RF Presel)**

Immediately executes an alignment of all subsystems except the RF subsystem. The instrument will stop any measurement currently underway, perform the

4 System
4.7 Alignments

alignment, and then restart the measurement from the beginning (similar to pressing the **Restart** key). This can be used to align portions of the instrument that are not impacted by an interfering user input signal.

This operation might be chosen instead of **All** if you do not want the device under test to experience a large change in input impedance, such as a temporary open circuit at the instrument input.

The query form of the remote commands (**:CALibration:NRF?**) invokes the alignment and returns a success or failure value.

Successful completion of **Align Now All but RF** clears the “Align Now All required” Error Condition, and clears Bit 14 in the Status Questionable Calibration register. If “Align Now All required” was in effect prior to executing **All but RF**, the Error Condition message “Align Now RF required” is generated and Bit 12 in the Status Questionable Calibration register is set. It will also begin the elapsed time counter for Last Align Now All Time, and capture the Last Align Now All Temperature.

Align Now All but RF can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the **:ABORt** SCPI command. When this occurs, the Error Condition message “Align Now All required” is generated, and Bit 14 is set in the Status Questionable Condition register. This is because new alignment data may be used for an individual subsystem, but not a full new set of data for all subsystems.

Remote Command	:CALibration:NRF :CALibration:NRF?
Example	:CAL:NRF
Notes	Returns 0 if successful, or 1 if failed While Align Now All but RF is performing the alignment, Bit 0 in the Status Operation register is set. Completion, or termination, will clear Bit 0 in the Status Operation register This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the :ABORt command Successful completion clears Bit 14 in the Status Questionable Calibration register and sets Bit 12 if invoked with “Align Now All required”
Couplings	Initializes the time for the Last Align Now All Time Records the temperature for the Last Align Now All Temperature
Status Bits/OPC dependencies	Bits 12 or 14 may be set in the Status Questionable Calibration register
Remote Command	:CALibration:NRF:NPending
Example	:CAL:NRF:NPEN
Notes	:CALibration:NRF:NPending is the same as :CALibration:NRF , including all conditions, status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use

status register bits to query whether the calibration is successfully completed or not

Typical usage is:

1. `:CALibration:NRF:NPENding` (start the All but RF calibration)
2. `:STATus:OPERation:CONDition?` (If bit 0 is set, then the system is doing calibration, you should do re-query until this bit is cleared)
3. `:STATus:QUESTionable:CALibration:CONDition?` (to check if there are any errors/-failures in previous calibration procedure)

4.7.2.3 Align Now RF

In PXE, the key label is **Align Now RF Only**

Immediately executes an alignment of the RF subsystem. The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

This operation might be desirable if the alignments had been set to not include RF alignments, or if previous RF alignments could not complete because of interference which has since been removed.

If an interfering user signal is present at the RF Input, the alignment will terminate and generate the Error Condition message “Align RF skipped”, and Error Condition “Align Now, RF required”. In addition, bits 11 and 12 will be set in the Status Questionable Calibration register.

The query form of the remote commands (`:CALibration:RF?`) invokes the alignment of the RF subsystem and returns a success or failure value. An interfering user signal is grounds for failure.

Successful completion of **Align Now RF** begins the elapsed time counter for Last Align Now, RF Time, and capture the Last Align Now, RF Temperature.

Align Now RF can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the `:ABORt` SCPI command. When this occurs, the Error Condition message “Align Now, RF required” is generated, and Bit 12 is set in the Status Questionable Condition register. None of the new alignment data is used.

Remote Command	<code>:CALibration:RF</code> <code>:CALibration:RF?</code>
Example	<code>:CAL:RF</code>
Notes	Returns 0 if successful, or 1 if failed (including interfering user signal) While Align Now RF is performing the alignment, Bit 0 in the Status Operation register is set. Completion, or termination, clears Bit 0 in the Status Operation register This command is sequential; it must complete before further SCPI commands are processed.

	<p>Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the :ABORT command</p> <p>Successful completion clears the Error Conditions “Align RF skipped” and the Error Conditions “Align RF failed” and “Align Now, RF required”, and clears Bits 3, 11, and 12 in the Status Questionable Calibration register</p> <p>A failure encountered during alignment generates the Error Condition message “Align RF failed” and sets Bit 3 in the Status Questionable Calibration register</p> <p>An interfering user signal will result in Bits 11 and 12 being set in the Status Questionable Calibration register, to indicate Align Now, RF is required</p> <p>An interfering user supplied signal results in the instrument requiring Align Now RF with the interfering signal removed</p>
Couplings	<p>Initializes the time for the Last Align Now, RF Time</p> <p>Records the temperature for the Last Align Now, RF Temperature</p>
Status Bits/OPC dependencies	Bits 11, 12, or 14 may be set in the Status Questionable Calibration register
Remote Command	:CALibration:RF:NPENding
Example	:CAL:RF:NPEN
Notes	<p>:CALibration:RF:NPENding is the same as :CALibration:RF, including all conditions, status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> 1. :CALibration:RF:NPENding (Start a RF calibration) 2. :STATus:OPERation:CONDition? (If Bit 0 is set, then the system is doing calibration, you should do re-query until this bit is cleared) 3. :STATus:QUESTionable:CALibration:CONDition? (to check if there are any errors/-failures in previous calibration procedure)

4.7.2.4 Align Now Expired

Alignments can be Expired when **Auto Align** is **PARTial** or **OFF**.

This control runs the alignments that have expired. This differs from performing **Align All, Now.**, which performs an alignment of all subsystems regardless of whether they are needed or not, whereas **Execute Expired Alignments** aligns only the individual subsystems that have become due.

Remote Command	:CALibration:EXPIred :CALibration:EXPIred?
Example	:CAL:EXP?
Notes	:CALibration:EXPIred? returns 0 if successful, or 1 if failed

While **Align Now Expired** is performing the alignment, the Calibrating bit (Bit 0 in the Status Operation register) is set. Completion, or termination, clears Bit 0 in the Status Operation register

This command is sequential; that is, it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by **:ABORT**. Successful completion clears bit 14 in the Status Questionable Calibration register

An interfering user signal is not grounds for failure of **Align Now Expired**. However, if RF Alignment was required, Bits 11 and 12 are set in the Status Questionable Calibration register to indicate Align Now, RF is required

Status Bits/OPC dependencies Bits 11, 12, or 14 may be set in the Status Questionable Calibration register

4.7.2.5 Align Now Preselector

Normally, Preselector Alignment runs during power up, and during the twenty minutes after power up, whenever there is a 1-degree internal temperature change.

This alignment is also run when an **"Align Now All"** on page 2753 is performed. This feature is helpful during the 20-minute warm-up time to correct for preselector drift while alignments are being held off. This feature can also be used in lieu of using the Preselector Center functionality, to improve speed throughput for remote testing with minimal impact to amplitude accuracy specs. The algorithm centers the preselector at the upper and lower operating frequencies of the YTF preselector.

The **Align Now Preselector** alignment is *not* a substitute for the Characterizer Preselector Advanced Alignment, which creates the default preselector centering curves for the YTF Preselector and is typically run annually.

Remote Command **:CALibration:PRESelector**
:CALibration:PRESelector?

Example **:CAL:PRES**

Notes Returns 0 if successful, or 1 if failed (including interfering user signal)

While **Align Now Preselector** is performing the alignment, Bit 0 in the Status Operation register is set. Completion, or termination, clears Bit 0 in the Status Operation register

This command is sequential; that is, it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by **:ABORT**

Successful completion clears the Error Conditions "Align Preselector failed" and clears Bit 3 in the Status Questionable Calibration Failure (Extended) register

A failure encountered during alignment generates the Error Condition message "Align Preselector failed" and sets Bit 3 in the Status Questionable Calibration Failure (Extended) register

Status Bits/OPC dependencies Bit 3 may be set in the Status Questionable Calibration Failure (Extended) register

4.7.2.6 Align Now All but RF Preselector

Only available in models with the RF Preselector, such as the N9048B. It is identical to the "Align Now All" on page 2753 (plus RF Presel) function, except that the RF Preselector is only partially aligned. Only the System Gain, Mechanical attenuator and Electronic attenuator alignments on the RF Preselector path are aligned. The purpose of these alignments is to improve the RF Preselector path amplitude variation compared to the bypass path.

Remote Command	<code>:CALibration:NRFPreselector</code> <code>:CALibration:NRFPreselector?</code>
Example	<code>:CAL:NRFPre</code>
Dependencies	Only appears in N9048B. Sending the SCPI command or query in other models generates an error
Status Bits/OPC dependencies	Bits 12 or 14 may be set in the Status Questionable Calibration register

4.7.2.7 Align Now RF Presel Only (20 Hz to 3.6 GHz)

Only available in models with the RF Preselector, such as the N9048B. It executes an alignment of the RF Preselector section. The receiver will stop any measurement currently underway, perform the alignment, and then restart the measurement from the beginning (similar to pressing the **Restart** key). *Only* the RF Preselector is aligned; no Align Now All function is performed first.

The query (`:CALibration:RFPreselector:ONLY?`) invokes the alignment of the RF Preselector on both Conducted and Radiated Band, and returns a success or failure value. Successful completion clears the "Align 20 Hz to 3.6 GHz required" Error Condition, and clears Bit 1 and Bit 2 in the Status Questionable Calibration Extended Needed register.

The elapsed time counter will begin for Last Align Now, Conducted Time and Last Align Now Radiated Time and the temperature is captured for Last Align Now, Conducted Temperature and Last Align Now, Radiated Temperature. The alignment can be interrupted by pressing the **Cancel (ESC)** front-panel key or remotely with Device Clear followed by the `:ABORT` SCPI command. When this occurs, the Error Condition "Align 20 Hz to 3.6 GHz required" is set because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

The "Align 20 Hz to 3.6 GHz required" Error Condition will appear when this alignment has expired. The user is now responsible to perform the Align Now, 20 Hz to 3.6 GHz in order to keep the receiver in warranted operation. This alignment can only be performed by the user, as it is not part of the Auto Align process.

Remote Command	<code>:CALibration:RFPreselector:ONLY</code>
----------------	--

	<code>:CALibration:RFPSelector:ONLY?</code>
Example	<code>:CAL:RFPS:ONLY</code>
Notes	<p>Query returns 0 if successful, or 1 if failed</p> <p>When Align 20 Hz to 3.6 GHz is performing the alignment, bit 0 in the Status Operation register is set. Completion, or termination, will clear bit 0 in the Status Operation register</p> <p>This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <code>:ABORT</code> command. Successful completion clears Bits 1 and 2 in the Status Questionable Calibration Extended Needed register and Bits 0 and 1 in Status Questionable Calibration Extended Failure register</p> <p>A failure encountered during alignment sets the Error Condition “20 Hz to 3.6 GHz Alignment Failure”, sets Bits 1 and 2 in the Status Questionable Calibration Extended Needed register, and Bit 9 in Status Questionable Calibration register</p>
Dependencies	<p>Only appears in N9048B. Sending the SCPI command or query in other models generates an error</p> <p>This key is grayed-out if the instrument is displaying an “Align Now All required” message. If you press the key while it is grayed-out, you will see the informational message, “Align Now All required first”</p>
Couplings	<p>Initializes the time for the Last Align Conducted Now, Conducted Time</p> <p>Initializes the time for the Last Align Radiated Now, Radiated Time</p> <p>Records the temperature for the Last Align Conducted Now, Conducted Temperature</p> <p>Records the temperature for the Last Align Radiated Now, Radiated Temperature</p>
Status Bits/OPC dependencies	<p>Bit 8 or 9 may be set in the Status Questionable Calibration register</p> <p>Bit 1 and 2 may be set in the Status Questionable Calibration Extended Needed register</p> <p>Bit 0 and 1 may be set in the Status Questionable Calibration Extended Failure register</p>

4.7.2.8 Align Now External Mixer

Immediately executes an alignment of the External Mixer that is plugged into the USB port. The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key). As this alignment calibrates the LO power to the mixer, this is considered an LO alignment; and failure is classified as an LO alignment failure.

The query (`:CALibration:EMIXer?`) invokes the alignment of the External Mixer and returns a success or failure value.

Remote Command	<code>:CALibration:EMIXer</code> <code>:CALibration:EMIXer?</code>
Example	<code>:CAL:EMIX</code>
Notes	<p>Returns 0 if successful, or 1 if failed</p> <p>While Align Now External Mixer is performing the alignment, Bit 0 in the Status Operation register is set. Completion, or termination, clears Bit 0 in the Status Operation register</p>

	<p>This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the :ABORt command</p> <p>A failure encountered during alignment generate the Error Condition message “Align LO failed” and sets Bit 5 in the Status Questionable Calibration register. Successful completion clears the “Align LO failed” message and Bit 5 in the Status Questionable Calibration register</p>
Dependencies	This control does not appear unless option EXM is present and is grayed-out, unless a USB mixer is plugged in to the USB
Status Bits/OPC dependencies	Bit3 may be set in the Status Questionable Calibration Extended Failure register

4.7.2.9 Align Source

Accesses source alignment processes that are immediate action operations. They perform complete operations and run until they are complete.

The instrument stops any sequence of the source, performs the alignment, then restarts the sequence from the beginning.

Note: This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, it is required to perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert available for the source alignment. Operators are responsible for checking temperature shift since the last **Align Now Source** to determine whether the source alignment needs to be executed.

Remote Command	:CALibration:INTernal:SOURce[:ALL] :CALibration:INTernal:SOURce[:ALL]?
Example	:CAL:INT:SOUR
Notes	:CAL:INT:SOUR? Initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models SP900B/11A
Couplings	Initializes the time for the Last Align Source Now, All Time Records the temperature for the Last Align Source Now, All Temperature
Remote Command	:CALibration:INTernal:SOURce[:ALL]:NPENDING
Example	:CAL:INT:SOUR:NPEN
Notes	:CALibration:INTernal:SOURce[:ALL]:NPENDING is the same as :CALibration:INTernal:SOURce[:ALL] , including all conditions and status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not Typical usage is:

	<ol style="list-style-type: none"> 1. <code>:CALibration:INTernal:SOURce:NPending</code> (start an internal source calibration) 2. <code>:STATus:OPERation:CONDition?</code> (Check if the calibration is completed or not, If Bit 0 is set, then the system is doing calibration. Repeat this query until the bit is cleared) 3. <code>:STATus:QUESTionable:CALibration:EXTended:FAILure:CONDition?</code> (Check if Bit 14 is set or not. If this bit is set, that means there are some errors in previous internal source calibration)
Dependencies	Only appears in VXT models SP900B/11A

4.7.2.10 Align Receiver

Accesses receiver alignment processes that are immediate action operations. They perform complete operations and run until they are complete.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, it is required to perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert available for the receiver alignment. Operators are responsible for checking temperature shift since the last Align Now, Align Receiver, to determine whether the receiver alignment needs to be executed.

Remote Command	<code>:CALibration:INTernal:RECeiver[:ALL]</code> <code>:CALibration:INTernal:RECeiver[:ALL]?</code>
Example	<code>:CAL:INT:REC</code>
Notes	<code>:CAL:INT:REC?</code> Initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models SP900B/11A
Couplings	Initializes the time for the Last Align Receiver Now, All Time Records the temperature for the Last Align Receiver Now, All Temperature

4.7.2.11 Align Fast

Accesses fast alignment processes, which are immediate action operations and perform complete operations, running until they are complete.

This aligns the subsystem that is most sensitive to temperature and time and includes:

- compensating the DC offset, gain imbalance and quadrature phase imbalance of IQ Modulator and/or Demodulator

4 System
4.7 Alignments

- compensating the gain offset of RF path

It is suggested to perform Fast Alignment every 8 hours or when temperature has changed more than 5°C from the previous Fast Alignment.

Remote Command	<code>:CALibration:INTernal:FAST[:ALL]</code> <code>:CALibration:INTernal:FAST[:ALL]?</code>
Example	<code>:CAL:INT:FAST</code>
Notes	<code>:CAL:INT:FAST?</code> Initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models SP900B/11A /15A/16A

4.7.2.12 Align LO Leakage

Accesses LO Leakage alignment processes, which are immediate action operations and perform complete operations, running until they are complete.

This alignment reduce the LO Leakage of the instrument.

Remote Command	<code>:CALibration:INTernal:LOLeakage</code> <code>:CALibration:INTernal:LOLeakage?</code>
Example	<code>:CAL:INT:LOL</code>
Notes	<code>:CAL:INT:LOL?</code> Initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models SP900B/11A /15A/16A

4.7.2.13 Align IF Cable

Accesses IF Cable alignment processes, which are immediate action operations and perform complete operations, running until they are complete.

This alignment aligns the IF cabling to the remote heads.

Remote Command	<code>:CALibration:INTernal:RRHead:IFCable</code> <code>:CALibration:INTernal:RRHead:IFCable?</code>
Example	<code>:CAL:INT:RRH:IFC</code>
Notes	<code>:CAL:INT:RRH:IFC?</code> Initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears when M1741A or M1749A or M1740A is associated with VXT models
Backwards Compatibility SCPI	<code>:CALibration:INTernal:IFCable</code> <code>:CALibration:INTernal:IFCable?</code>

4.7.2.14 Align RRH Amplitude

This is an immediate action operation, which runs until complete.

Aligns the Amplitude of Remote Radio Head. This operation could take quite a long time to run.

CAUTION

Make sure to connect 50-ohm terminations to Head Tx/Rx 1 and 2 ports.

Remote Command	<code>:CALibration:INTernal:RRHead:AMPLitude</code> <code>:CALibration:INTernal:RRHead:AMPLitude?</code>
Example	<code>:CAL:INT:RRH:AMPL?</code>
Notes	<code>:CAL:INT:RRH:AMPL?</code> Initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears when M1741A or M1749A is associated with VXT models
Backwards	<code>:CALibration:INTernal:RRHAmp</code>
Compatibility SCPI	<code>:CALibration:INTernal:RRHAmp?</code>

4.7.2.15 Align LO Clock

This is an immediate action operation, which runs until complete.

Synchronizes RRH LO Clocks.

Remote Command	<code>:CALibration:INTernal:RRHead:LOSync</code> <code>:CALibration:INTernal:RRHead:LOSync?</code>
Example	<code>:CAL:INT:RRH:LOS?</code>
Notes	<code>:CAL:INT:RRH:LOS?</code> Initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears when M1741A or M1749A is associated with VXT models
Backwards	<code>:CALibration:INTernal:LOSync</code>
Compatibility SCPI	<code>:CALibration:INTernal:LOSync?</code>

4.7.2.16 Align Selected Freq Ranges

VXT models SP900B/11A provide five alignments: **Align Now All**, **Align Source**, **Align Receiver**, **Align Fast** and **Align LO Leakage**. Every time you execute one of these alignments, the system performs a full span alignment. To save time, it is possible to limit the range of alignment frequency settings. **Align Selected Freq Ranges** allows you to set the start and stop frequency of an alignment.

4 System

4.7 Alignments

The example below shows the steps for processing Align Receiver on VXT model SP900B, specifying a frequency range from 1.3 GHz to 1.8 GHz, and 2.5 GHz to 3.9 GHz.

- First row: set the Start and Stop Frequency to 1.3 GHz and 1.8 GHz. Enable the first row
- Second row: set the Start and Stop Frequency to 2.5 GHz and 3.9 GHz. Enable the second row
- Click **Align Receiver**. A message appears: “Aligning Selected Freq Ranges 1 of 7”

The equivalent SCPI command sequence is:

```
:CAL:INT:ASFR ON
:CAL:INT:ASFR:FRAN 1.3 GHz, 1.8 GHz, 2.5 GHz, 3.9 GHz
:CAL:INT:REC
```

Remote Command	<code>:CALibration:INTernal:ASFRanges[:STATE] ON OFF 1 0</code> <code>:CALibration:INTernal:ASFRanges?</code>
Example	<code>:CAL:INT:ASFR ON</code> <code>:CAL:INT:ASFR?</code>
Notes	When Align Selected Freq Ranges is ON , the table is displayed for setting up the frequency ranges to be aligned
Dependencies	Only available in: <ul style="list-style-type: none"> – VXT models SP900B/11A/15A/16A – VXT models SP900B/11A/15A/16A with RRH and/or CIU <p>Only functional for the following alignments:</p> <ul style="list-style-type: none"> – Align Now All of VXT models SP900B/11A/15A/16A – Align Source – Align Receiver – Align Fast – Align LO Leakage <p>Align Selected Freq Ranges only guarantees the hardware performance within the frequency range</p>
Preset	OFF

Enable Extended Freq Range

Allows you to set frequency ranges for VXT models SP900B/11A/15A with Remote Head and/or CIU. When Enable Extended Freq Range is not active, the frequency

range is limited by VXT models only.

Remote Command	<code>:CALibration:INTernal:ASFRRanges:EXTend[:STATe] ON OFF 1 0</code> <code>:CALibration:INTernal:ASFRRanges:EXTend[:STATe]?</code>
Example	<code>:CAL:INT:ASFR:EXT ON</code> <code>:CAL:INT:ASFR:EXT?</code>
Dependencies	Only available in VXT models SP900B/11A/15A/16A with Remote Head and/or CIU Only available when Align Specified Freq Ranges is ON
Preset	OFF

Frequency Range

Allows you to set the alignment frequency range.

Remote Command	<code>:CALibration:INTernal:ASFRRanges:FRANges <startFreq>,<stopFreq></code> <code>[,<startFreq>,<stopFreq>][,<startFreq>,<stopFreq>][,<startFreq>,<stopFreq>][,<startFreq>,<stopFreq>]</code>
Example	<code>:CAL:INT:ASFR:FRAN 1.3 GHz, 1.8 GHz, 2.5 GHz, 3.9 GHz</code> <code>:CAL:INT:ASFR:FRAN?</code>
Notes	<code><startFreq></code> : Start frequency of an alignment <code><stopFreq></code> : Stop frequency of an alignment To process alignment for a single frequency point, set <code><startFreq> = <stopFreq></code>
Dependencies	Only appears when "Align Selected Freq Ranges" on page 2765 is ON Error message "Invalid alignment frequency range" is reported if start and stop frequencies are invalid, such as: <ol style="list-style-type: none"> 1. Stop frequency - Start frequency < 0 2. The count of start and stop frequency is not even 3. The frequency is out of range. See "More Information" on page 2767 4. More than 5 pairs of start and stop frequencies are listed
Preset	1.0 GHz, 2.0 GHz

More Information

When **"Enable Extended Freq Range" on page 2766** is not active, the frequency range depends on the VXT model. The table below lists the Start and Stop Frequency Ranges for VXT models SP900B/11A/15A:

Hardware	Options	Min Frequency	Max Frequency
SP900B/11A	F06	330 MHz	6.08 GHz
	F06 & EP6	330 MHz	6.6 GHz
	F06 & LFE & EP6	6.5 kHz	6.6 GHz
SP900B/16A	F06	330 MHz	6.6 GHz
	F08	330 MHz	8.6 GHz
	F12	330 MHz	12.9 GHz

When **Enable Extended Freq Range** is active, the frequency range depends on the extensions connected to the VXT model. The table below lists the Start and Stop Frequency Ranges for VXT models with Radio Heads/CIU:

Connected with Radio Heads/CIU	Min frequency	Max frequency	IF Frequency range
VXT + CIU	5.9 GHz	12 GHz	1.4 GHz ~ 4.6 GHz
VXT + CIU + RRH	24.25 GHz	43.5 GHz	2.5 GHz ~ 4.5 GHz

NOTE

The Min frequency and Max frequency are also the preset frequencies. We recommend using the preset frequency range for VXT models with extensions. An alignment with the full IF Frequency range will be executed ignoring the specific ranges.

Enable

Enables or disables the selected frequency ranges.

Preset **OFF**

4.7.2.17 Align External Mixer Path

Immediately executes an alignment of the External Mixer Path inside the VXT models SP900B/16A. External Mixer Path is used when the RF Port is connected to an external Remote Radio Head (RRH). It provides a better performance compared to the normal path. External Mixer Path Alignment covers frequencies from 2.4 GHz to 3.4 GHz of the external mixer path.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, you need only perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert for the External Mixer Path alignment. You are responsible for checking the temperature shift since the last **Align Now, External Mixer Path**, to determine whether the external mixer path alignment needs to be executed.

Remote Command	<code>:CALibration:INTernal:EMPath</code> <code>:CALibration:INTernal:EMPath?</code>
Example	<code>:CAL:INT:EMP</code>
Notes	The query initiates an alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models SP900B/16A when Option MXP is installed
Couplings	Initializes the time for the Last Align External Mixer Path Now, All Time Records the temperature for the Last Align External Mixer Path Now, All Temperature

4.7.2.18 Align Low Band

Accesses Low Band alignment processes that are immediate action operations. They perform complete operations and run until they are complete. Low Band Alignment covers frequencies from 380 MHz to 4.3 GHz of the non-external mixer path.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, you need only perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert for the Low Band alignment. You are responsible for checking the temperature shift since the last **Align Now, Align Low Band**, to determine whether the Low Band alignment needs to be executed.

Remote Command	<code>:CALibration:INTernal:LBAND[:ALL]</code> <code>:CALibration:INTernal:LBAND[:ALL]?</code>
Example	<code>:CAL:INT:LBAN</code>
Notes	The query initiates an Alignment, and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models SP900B/16A
Couplings	Initializes the time for the Last Align Low Band Now, All Time Records the temperature for the Last Align Low Band Now, All Temperature

4.7.2.19 Align High Band

Accesses High Band alignment processes that are immediate action operations. They perform complete operations and run until they are complete. High Band Alignment covers frequencies from 4.3 GHz to 12 GHz of the non-external mixer path.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, you need only perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert for the High Band alignment. You are responsible for checking the temperature shift since last **Align Now, Align High Band**, to determine whether the High Band alignment needs to be executed.

Remote Command	<code>:CALibration:INTernal:HBAND[:ALL]</code> <code>:CALibration:INTernal:HBAND[:ALL]?</code>
Example	<code>:CAL:INT:HBAN</code>
Notes	The query initiates an Alignment, and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models SP900B/16A
Couplings	Initializes the external time for the Last Align High Band Now, All Time Records the temperature for the Last Align High Band Now, All Temperature

4.7.3 MIMO

Accesses MIMO alignment processes that are immediate action operations.

4.7.3.1 Align MIMO All

Immediately executes an MIMO alignments in sequence.

Remote Command	<code>:CALibration:MIMO:ALL</code> <code>:CALibration:MIMO:ALL?</code>
Example	<code>:CAL:MIMO</code>
Notes	Query returns 0 if successful, or 1 if failed
Remote Command	<code>:CALibration:MIMO:ALL:NPending</code> <code>:CALibration:MIMO:ALL:NPending?</code>
Example	<code>:CAL:MIMO:NPEN</code>
Notes	This command is the same as <code>:CALibration:MIMO:ALL</code> , including all conditions, status register bits, except that this command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not Typical usage is: <ol style="list-style-type: none"> <code>:CALibration:MIMO:ALL:NPENDING</code> (start All MIMO calibrations) <code>:STATus:OPERation:CONDition?</code> (If bit 0 is set, then the system is doing calibration, you

should do re-query until this bit is cleared)

3. `:STATus:QUESTionable:CALibration:CONDition?` (to check if there are any errors/- failures in previous calibration procedure)

4.7.3.2 Align MIMO Phase

Immediately executes a MIMO phase alignment.

Remote Command	<code>:CALibration:MIMO:PHASe</code> <code>:CALibration:MIMO:PHASe?</code>
Example	<code>:CAL:MIMO:PHAS</code>
Notes	Query returns 0 if successful, or 1 if failed
Remote Command	<code>:CALibration:MIMO:PHASe:NPENDING</code> <code>:CALibration:MIMO:PHASe:NPENDING?</code>
Example	<code>:CAL:MIMO:PHAS:NPEN</code>
Notes	This command is the same as <code>:CALibration:MIMO:PHASe</code> , including all conditions, status register bits, except that this command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not Typical usage is: <ol style="list-style-type: none"> 1. <code>:CALibration:MIMO:PHASe:NPENDING</code> (start MIMO phase calibration) 2. <code>:STATus:OPERation:CONDition?</code> (If bit 0 is set, then the system is doing calibration, you should do re-query until this bit is cleared) 3. <code>:STATus:QUESTionable:CALibration:CONDition?</code> (to check if there are any errors/- failures in previous calibration procedure)

4.7.3.3 Align MIMO Trigger Delay

Immediately executes a MIMO Trigger Delay alignment.

Note that, for this calibration, the primary instrument's Cal Out must be connected to the primary and secondary instrument's RF input port. A pop-up window appears to allow you to confirm connection setup.

Remote Command	<code>:CALibration:MIMO:DELay:TRIGger</code> <code>:CALibration:MIMO:DELay:TRIGger?</code>
Example	<code>:CAL:MIMO:DEL:TRIG</code>
Notes	Query returns 0 if successful, or 1 if failed
Remote Command	<code>:CALibration:MIMO:DELay:TRIGger:NPENDING</code>

	<code>:CALibration:MIMO:DElay:TRIGger:NPENding?</code>
Example	<code>:CAL:MIMO:DEL:TRIG:NPEN</code>
Notes	<p>This command is the same as <code>:CALibration:MIMO:DElay:TRIGger</code>, including all conditions, status register bits, except that this command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> 1. <code>:CALibration:MIMO:DElay:TRIGger:NPENding</code> (start MIMO trigger delay calibration) 2. <code>:STATus:OPERation:CONDition?</code> (If bit 0 is set, then the system is doing calibration, you should do re-query until this bit is cleared) 3. <code>:STATus:QUESTionable:CALibration:CONDition?</code> (to check if there are any errors/-failures in previous calibration procedure)

4.7.3.4 Align MIMO Residual Delay

Immediately executes a MIMO Residual Delay alignment.

Note that, for this calibration, the primary instrument's Cal Out must be connected to the primary and secondary instrument's RF input port. A pop-up window appears to allow you to confirm connection setup.

Remote Command	<code>:CALibration:MIMO:DElay:RESidual</code> <code>:CALibration:MIMO:DElay:RESidual?</code>
Example	<code>:CAL:MIMO:DEL:RES</code>
Notes	Query returns 0 if successful, or 1 if failed
Remote Command	<code>:CALibration:MIMO:DElay:RESidual:NPENding</code> <code>:CALibration:MIMO:DElay:RESidual:NPENding?</code>
Example	<code>:CAL:MIMO:DEL:RES:NPEN</code>
Notes	<p>The command is the same as <code>:CALibration:MIMO:DElay:RESidual</code>, including all conditions, status register bits, except that this command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> 1. <code>:CALibration:MIMO:DElay:RESidual:NPENding</code> (start MIMO residual delay calibration) 2. <code>:STATus:OPERation:CONDition?</code> (If bit 0 is set, then the system is doing calibration, you should do re-query until this bit is cleared) 3. <code>:STATus:QUESTionable:CALibration:CONDition?</code> (to check if there are any errors/-failures in previous calibration procedure)

4.7.3.5 Start Freq

Sets the start frequency for MIMO alignments.

Remote Command	<code>:CALibration:MIMO:FREQuency:START <freq></code> <code>:CALibration:MIMO:FREQuency:START?</code>
----------------	--

Example	<code>:CAL:MIMO:FREQ:START 1GHz</code> <code>:CAL:MIMO:FREQ:START?</code>
---------	--

Preset	1 GHz
--------	-------

State Saved	Saved in instrument state
-------------	---------------------------

Min	0 Hz
-----	------

Max	60 GHz
-----	--------

4.7.3.6 Stop Frequency

Sets the stop frequency for MIMO alignments.

Remote Command	<code>:CALibration:MIMO:FREQuency:STOP <freq></code> <code>:CALibration:MIMO:FREQuency:STOP?</code>
----------------	--

Example	<code>:CAL:MIMO:FREQ:STOP 1GHz</code> <code>:CAL:MIMO:FREQ:STOP?</code>
---------	--

Preset	1 GHz
--------	-------

State Saved	Saved in instrument state
-------------	---------------------------

Min	> Start Frequency
-----	-------------------

Max	60 GHz
-----	--------

4.7.3.7 Secondary instrument IP address

Set secondary instrument IP address for MIMO alignments.

Remote Command	<code>:CALibration:MIMO:SECOndary:INSTrument1 ... 4:IPADdress <String></code> <code>:CALibration:MIMO:SECOndary:INSTrument1 ... 4:IPADdress1 ... 4?</code>
----------------	---

Example	<code>:CAL:MIMO:SEC:INST1:IPAD '192.168.1.2'</code>
---------	---

Preset	local
--------	-------

State Saved	Yes
-------------	-----

4.7.3.8 Secondary instrument selected

Select secondary instruments for MIMO alignment.

4 System
4.7 Alignments

Remote Command	<code>:CALibration:MIMO:SECondary:INSTrument1 ... 4:SELEcted OFF ON 0 1</code> <code>:CALibration:MIMO:SECondary:INSTrument1 ... 4:SELEcted?</code>
Example	<code>:CAL:MIMO:SEC:INST1 1</code> <code>:CAL:MIMO:SEC:INST1?</code>
State Saved	Yes

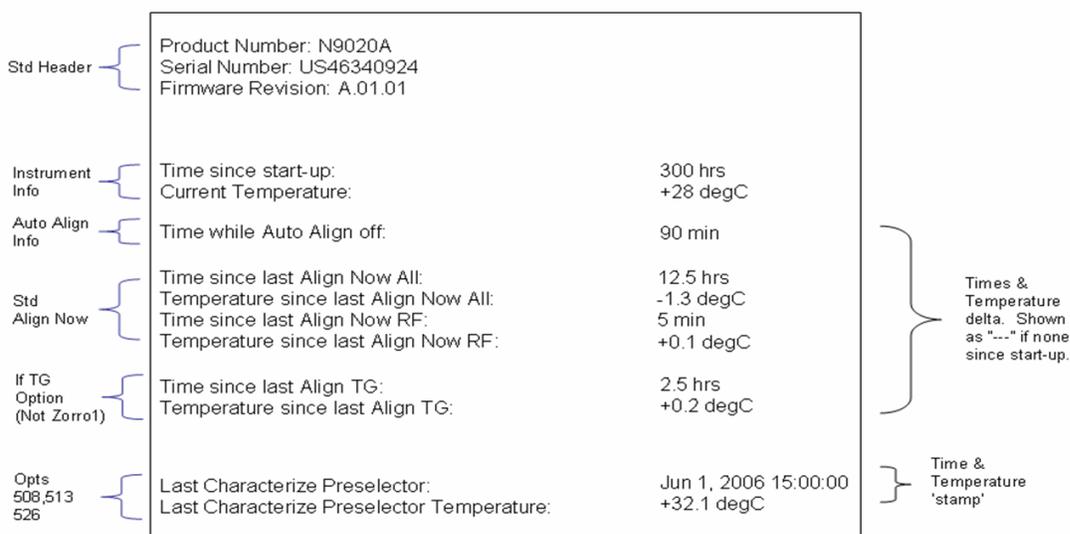

4.7.4 Show Alignment Statistics

Shows alignment information you can use to ensure that the instrument is operating in a specific manner. The **Show Alignment Statistics** screen is where you can view time and temperature information.

Values displayed are only updated when the **Show Alignment Statistics** screen is invoked. They are not updated while the **Show Alignment Statistics** screen is being displayed. The remote commands that access this information obtain current values.

Note that some of these statistics only display if your instrument supports them; for example, Last Source Align Now All Time only shows up in instruments which contain a source which supports auto alignments.

An example of the **Show Alignment Statistics** screen would be similar to:

“Time while Auto Align off” is not available in VXT models SP900B/11A.

A successful **Align Now, RF** sets the Last Align RF temperature to the current temperature, and resets the Last Align RF time. A successful **Align Now All** or **Align Now All but RF** sets the Last Align Now All temperature to the current temperature,

and resets the Last Align Now All time. A successful **Align Now All** also resets the Last Align RF items if the RF portion of the **Align Now** succeeded.

Example	<code>:SYST:SHOW ALIGN</code>
---------	-------------------------------

Notes	The values displayed on the screen are only updated upon entry to the screen, and not updated while the screen is being displayed
-------	---

The following data-specific queries are available:

Query Time since Startup

Remote Command	<code>:SYSTem:PON:TIME?</code>
----------------	--------------------------------

Example	<code>:SYST:PON:TIME?</code>
---------	------------------------------

Notes	Value is the time since the most recent start-up in seconds
-------	---

State Saved	No
-------------	----

Query Current Temperature

Remote Command	<code>:CALibration:TEMPerature:CURRent?</code>
----------------	--

Example	<code>:CAL:TEMP:CURR?</code>
---------	------------------------------

Notes	Value is in degrees Centigrade
-------	--------------------------------

State Saved	No
-------------	----

Query Time since Last Align Now All

Remote Command	<code>:CALibration:TIME:LALL?</code>
----------------	--------------------------------------

Example	<code>:CAL:TIME:LALL?</code>
---------	------------------------------

Notes	Value is the elapsed time, in seconds, since the last successful Align Now All or Align Now All but RF was executed
-------	---

State Saved	No
-------------	----

Query Temperature of Last Align Now All

Remote Command	<code>:CALibration:TEMPerature:LALL?</code>
----------------	---

Example	<code>:CAL:TEMP:LALL?</code>
---------	------------------------------

Notes	Value is in degrees Centigrade at which the last successful Align Now All or Align Now All but RF was executed
-------	--

State Saved	No
-------------	----

Query Time since Last Align Now Receiver

Remote Command	<code>:CALibration:TIME:INTernal:RECeiver?</code>
Example	<code>:CAL:TIME:INT:REC?</code>
Notes	Value in hours since the last successful Align Now Receiver
Dependencies	Only appears in VXT models SP900B/11A
State Saved	No

Query Temperature of Last Align Now Receiver

Remote Command	<code>:CALibration:TEMPerature:INTernal:RECeiver?</code>
Example	<code>:CAL:TEMP:INT:REC?</code>
Notes	Value in degrees Centigrade when the last successful Align Now Receiver was executed
Dependencies	Only appears in VXT models SP900B/11A
State Saved	No

Query Time since Last Align Now Source

Remote Command	<code>:CALibration:TIME:INTernal:SOURce?</code>
Example	<code>:CAL:TIME:INT:SOUR?</code>
Notes	Value in hours since the last successful Align Now Source
Dependencies	Only appears in VXT models SP900B/11A
State Saved	No

Query Temperature of Last Align Now Source

Remote Command	<code>:CALibration:TEMPerature:INTernal:SOURce?</code>
Example	<code>:CAL:TEMP:INT:SOUR?</code>
Notes	Value in degrees Centigrade when the last successful Align Now Source was executed
Dependencies	Only appears in VXT models SP900B/11A
State Saved	No

Query Time since Last Align Now Fast

Remote Command	<code>:CALibration:TIME:INTernal:FAST?</code>
Example	<code>:CAL:TIME:INT:FAST?</code>
Notes	Value in hours since the last successful Align Now Fast
Dependencies	Only appears in VXT models SP900B/11A/15A/16A
State Saved	No

Query Temperature of Last Align Now Fast

Remote Command	<code>:CALibration:TEMPerature:INTernal:FAST?</code>
Example	<code>:CAL:TEMP:INT:FAST?</code>
Notes	Value in degrees Centigrade when the last successful Align Now Fast was executed
Dependencies	Only appears in VXT models SP900B/11A/15A/16A
State Saved	No

Query Time since Last Align Now LO Leakage

Remote Command	<code>:CALibration:TIME:INTernal:LOLeakage?</code>
Example	<code>:CAL:TIME:INT:LOL?</code>
Notes	Value in hours since the last successful Align Now LO Leakage
Dependencies	Only appears in VXT models SP900B/11A/15A/16A
State Saved	No

Query Temperature of Last Align Now LO Leakage

Remote Command	<code>:CALibration:TEMPerature:INTernal:LOLeakage?</code>
Example	<code>:CAL:TEMP:INT:LOL?</code>
Notes	Value in degrees Centigrade when the last successful Align Now LO Leakage was executed
Dependencies	Only appears in VXT models SP900B/11A/15A/16A
State Saved	No

Query Time since Last Align Now IF Cable

Remote Command	<code>:CALibration:TIME:INTernal:RRHead:IFCable?</code>
Example	<code>:CAL:TIME:INT:RRH:IFC?</code>
Notes	Value in hours since the last successful Align Now IF Cable
Dependencies	Only appears when M1741A or M1749A or M1740A is associated with VXT models
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TIME:INTernal:IFCable?</code>

Query Temperature of Last Align Now IF Cable

Remote Command	<code>:CALibration:TEMPerature:INTernal:RRHead:IFCable?</code>
Example	<code>:CAL:TEMP:INT:RRH:IFC?</code>
Notes	Value in degrees Centigrade when the last successful Align Now IF Cable was executed

Dependencies	Only appears when M1741A or M1749A or M1740A is associated with VXT models
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TEMPerature:INTernal:IFCable?</code>

Query Time since Last Align LO Clock

Remote Command	<code>:CALibration:TIME:INTernal:RRHead:LOSync?</code>
Example	<code>:CAL:TIME:INT:RRH:LOS?</code>
Notes	Value in hours since the last successful Align LO Clock
Dependencies	Only appears when M1741A or M1749A is associated with VXT models
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TIME:INTernal:LOSync?</code>

Query Temperature of Last Align LO Clock

Remote Command	<code>:CALibration:TEMPerature:INTernal:RRHead:LOSync?</code>
Example	<code>:CAL:TEMP:INT:RRH:LOS?</code>
Notes	Value in degrees Centigrade when the last successful Align LO Clock was executed
Dependencies	Only appears when M1741A or M1749A is associated with VXT models
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TEMPerature:INTernal:LOSync?</code>

Query Time since Last Align RRH Amplitude

Remote Command	<code>:CALibration:TIME:INTernal:RRHead:AMPLitude?</code>
Example	<code>:CAL:TIME:INT:RRH:AMPL?</code>
Notes	Value in hours since the last successful Align RRH Amplitude
Dependencies	Only appears when M1741A or M1749A is associated with VXT models
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TIME:INTernal:RRHAmp?</code>

Query Temperature of Last Align RRH Amplitude

Remote Command	<code>:CALibration:TEMPerature:INTernal:RRHead:AMPLitude?</code>
Example	<code>:CAL:TEMP:INT:RRH:AMPL?</code>

Notes	Value in degrees Centigrade when the last successful Align RRH Amplitude was executed
Dependencies	Only appears when M1741A or M1749A is associated with VXT models
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TEMPerature:INTernal:RRHAmp?</code>

Query Time since Last Align Now RF

Remote Command	<code>:CALibration:TIME:LRF?</code>
Example	<code>:CAL:TIME:LRF?</code>
Notes	Value is the elapsed time, in seconds, since the last successful Align Now, RF was executed, either individually or as a component of Align Now All
State Saved	No

Query Temperature of Last Align Now RF

Remote Command	<code>:CALibration:TEMPerature:LRF?</code>
Example	<code>:CAL:TEMP:LRF?</code>
Notes	Value is in degrees Centigrade at which the last successful Align Now RF was executed, either individually or as a component of Align Now All
State Saved	No

Query Time since Last Align IF

Remote Command	<code>:CALibration:TIME:LIF?</code>
Example	<code>:CAL:TIME:LIF?</code>
Notes	Value is the elapsed time, in seconds, since the last successful Align IF was executed
State Saved	No

Query Temperature of Last Align IF

Remote Command	<code>:CALibration:TEMPerature:LIF?</code>
Example	<code>:CAL:TEMP:LIF?</code>
Notes	Value is in degrees Centigrade at which the last successful Align IF was executed
State Saved	No

Query Time since Last Characterize Preselector

Remote Command	<code>:CALibration:TIME:LPreselector?</code>
Example	<code>:CAL:TIME:LPR?</code>
Notes	Value is the date and time the last successful Characterize Preselector was executed. The date is separated from the time by a space character Returns "" if no Characterize Preselector has ever been performed on the instrument
Dependencies	In models that do not include preselectors, this command is not enabled and any attempt to set or query yields an error
State Saved	No

Query Temperature of Last Characterize Preselector

Remote Command	<code>:CALibration:TEMPerature:LPreselector?</code>
Example	<code>:CAL:TEMP:LPR?</code>
Notes	Value is in degrees Centigrade at which the last successful Characterize Preselector was executed
Dependencies	In models that do not include preselectors, this command is not enabled and any attempt to set or query yields an error
State Saved	No

Query Time since Auto Align Off

Remote Command	<code>:CALibration:AUTO:TIME:OFF?</code>
Example	<code>:CAL:AUTO:TIME:OFF?</code>
Notes	Value is the elapsed time, in seconds, since Auto Align has been set to Off or Off with Alert . The value is 0 if Auto Align is ALL or NORF
State Saved	No

Query Time since Last Align Now 20 Hz - 30 MHz

Remote Command	<code>:CALibration:TIME:RFPSelector:LCONducted?</code>
Example	<code>:CAL:TIME:RFPS:LCON?</code>
Notes	Values are the date and time the last successful Align Now, 20 Hz - 30 MHz was executed. The date is separated from the time by a semi-colon character
State Saved	No

Query Temperature of Last Align Now 20 Hz - 30 MHz

Remote Command	<code>:CALibration:TEMPerature:RFPSelector:LCONducted?</code>
----------------	---

Command	
Example	<code>:CAL:TEMP:RFPS:LCON?</code>
Notes	Value is in degrees Centigrade at which the last successful Align Now, 20 Hz – 30 MHz was executed
State Saved	No

Query Time since Last Align Now 30 MHz - 3.6 GHz

Remote Command	<code>:CALibration:TIME:RFPSector:LRADiated?</code>
Example	<code>:CAL:TIME:RFPS:LRAD?</code>
Notes	Value is the date and time the last successful Align Now, 30 MHz – 3.6 GHz was executed. The date is separated from the time by a semi-colon character
State Saved	No

Query Temperature of Last Align Now 30 MHz - 3.6 MHz

Remote Command	<code>:CALibration:TEMPerature:RFPSector:LRADiated?</code>
Example	<code>:CAL:TEMP:RFPS:LRAD?</code>
Notes	Value is in degrees Centigrade at which the last successful Align Now, 30 MHz – 3.6 GHz was executed
State Saved	No

Query Next Scheduled Alignment Time

Remote Command	<code>:CALibration:RFPSector:SCHeduler:TIME:NEXT?</code> This query returns data using the following format: <code>YYYY/MM/DD; HH:MM:SS</code>
Example	<code>:CAL:RFPS:SCH:TIME:NEXT?</code>
Notes	The next run time will be updated based on the start date/time and recurrence set by the user “date” is representation of the date the task will run in the form: <code>YYYY/MM/DD</code> where: <ul style="list-style-type: none">- <code>YYYY</code> is the four-digit representation of year. (for example, 2009)- <code>MM</code> is the two-digit representation of month. (for example, 01 to 12)- <code>DD</code> is the two-digit representation of the day. (for example, 01 to 28, 29, 30 or 31 depending on the month and year) “time” is a representation of the time of day the task will run in the form: <code>HH:MM:SS</code>

where:

- **HH** is the two-digit representation of the hour in 24-hour format
- **MM** is the two-digit representation of minute
- **SS** is the two-digit representation of seconds

State Saved No

Query Time since Last Align Now External Mixer Path

Remote Command :CALibration:TIME:INTernal:EMPath?

Example :CAL:TIME:INT:EMP?

Notes Value in hours since the last successful **Align Now External Mixer Path**

Dependencies Only appears in VXT models SP900B/16A, when Option MXP is installed

State Saved No

Query Temperature of Last Align Now External Mixer Path

Remote Command :CALibration:TEMPerature:INTernal:EMPath?

Example :CAL:TEMP:INT:EMP?

Notes Value in degrees Centigrade when the last successful **Align Now External Mixer Path** was executed

Dependencies Only appears in VXT models SP900B/16A, when Option MXP is installed

State Saved No

Query Time since Last Align Now Low Band

Remote Command :CALibration:TIME:INTernal:LBAND?

Example :CAL:TIME:INT:LBAN?

Notes Value in hours since the last successful **Align Now Low Band**

Dependencies Only appears in VXT models SP900B/16A

State Saved No

Query Temperature of Last Align Now Low Band

Remote Command :CALibration:TEMPerature:INTernal:LBAND?

Example :CAL:TEMP:INT:LBAN?

Notes Value in degrees Centigrade when the last successful **Align Now Low Band** was executed

Dependencies Only appears in VXT models SP900B/16A

State Saved No

Query Time since Last Align Now High Band

Remote Command	<code>:CALibration:TIME:INTernal:HBAN?</code>
Example	<code>:CAL:TIME:INT:HBAN?</code>
Notes	Value in hours since the last successful Align Now High Band
Dependencies	Only appears in VXT models SP900B/16A
State Saved	No

Query Temperature of Last Align Now High Band

Remote Command	<code>:CALibration:TEMPerature:INTernal:HBANd?</code>
Example	<code>:CAL:TEMP:INT:HBAN?</code>
Notes	Value in degrees Centigrade when the last successful Align Now High Band was executed
Dependencies	Only appears in VXT models SP900B/16A
State Saved	No

4.7.5 Timebase DAC

Allows you to change the setting of the **Timebase DAC** from a factory calibrated setting to your own desired setting.

The display shows the current **Timebase DAC** setting at the top, and gives you a choice of **CALibrated** or **USER** setting. There is also a field for you to enter your desired setting.

Dependencies	Does not appear in VXT
--------------	------------------------

4.7.5.1 Timebase DAC

Allows control of the internal 10 MHz reference oscillator timebase. This may be used to adjust for minor frequency alignment between your signal's reference and the internal frequency reference. This adjustment has no effect if the instrument is operating with an External Frequency Reference.

If the value of the **Timebase DAC** changes (by switching to **CALibrated** from **USER** with **User Value** set to a different value, or in **USER** with a new value entered) an alignment may be necessary. The alignment system will take appropriate action; which will either invoke an alignment or cause an **Alert**.

The **CALibrated** setting sets the **Timebase DAC** to the value established during factory or field calibration. In this case the value displayed at the top of the screen is the calibrated value.

The **USER** setting sets the **Timebase DAC** to the value set on the **User Value** control. In this case the value displayed at the top of the screen is the user value.

Remote Command	<code>:CALibration:FREquency:REference:MODE CALibrated USER</code> <code>:CALibration:FREquency:REference:MODE?</code>
Example	<code>:CAL:FREQ:REF:MODE CAL</code>
Notes	If the value of the timebase is changed the alignment system automatically performs an alignment or alerts that an alignment is due
Dependencies	Not available in UXM
Preset	Unaffected by Preset , but set to CALibrated by Restore System Defaults->Align
State Saved	No

4.7.5.2 User Value

Allows you to set the **Timebase DAC** to a value other than the value established during the factory or field calibration. The current value of the DAC is displayed at the top of the screen. This will be the Calibrated value if **Timebase DAC** is set to **CALibrated**.

Remote Command	<code>:CALibration:FREquency:REference:FINE <integer></code> <code>:CALibration:FREquency:REference:FINE?</code>
Example	<code>:CAL:FREQ:REF:FINE 8191</code>
Notes	If the value of the timebase is changed the alignment system automatically performs an alignment or alerts that an alignment is due
Couplings	Setting <code>:CAL:FREQ:REF:FINE</code> sets <code>:CAL:FREQ:REF:MODE USER</code>
Preset	Unaffected by Preset , but set to the factory setting by Restore System Defaults->Align
State Saved	No
Min	0
Max	16383
Backwards Compatibility SCPI	<code>:CALibration:FREquency:REference:COARse</code> ESA hardware contained two DAC controls for the Timebase. In X-Series the command <code>:CALibration:FREquency:REference:FINE</code> is the method for adjusting the timebase. The COARse option is provided as an alias to FINE
Remote Command	<code>:CALibration:FREquency:REference:COARse <integer></code> <code>:CALibration:FREquency:REference:COARse?</code>
Example	<code>:CAL:FREQ:REF:COAR 8191</code>
Notes	This is an alias for <code>:CAL:FREQ:REF:FINE</code> . Any change to COARse is reflected in FINE and <i>vice-versa</i> . See <code>:CAL:FREQ:REF:FINE</code> for description of functionality
Couplings	Setting <code>:CAL:FREQ:REF:COAR</code> sets <code>:CAL:FREQ:REF:MODE USER</code>

4.7.6 Advanced

Accesses alignment processes that are immediate action operations that perform operations that run until complete. **Advanced** alignments are performed on an irregular basis, or require additional operator interaction.

Dependencies	Not available in UXM
--------------	----------------------

4.7.6.1 Characterize Preselector

The Preselector tuning curve drifts over temperature and time. Recognize that the Amplitude, Presel Center function adjusts the preselector for accurate amplitude measurements at an individual frequency. Characterize Preselector improves the amplitude accuracy by ensuring the Preselector is approximately centered at all frequencies without the use of the Amplitude, Presel Center function. Characterize Preselector can be useful in situations where absolute amplitude accuracy is not of utmost importance, and the throughput savings or convenience of not performing a Presel Center is desired. Presel Center is required prior to any measurement for best (and warranted) amplitude accuracy.

Keysight recommends that the Characterize Preselector operation be performed yearly as part of any calibration, but performing this operation every three months can be worthwhile.

Characterize Preselector immediately executes a characterization of the Preselector, which is a YIG-tuned filter (YTF). The instrument stops any measurement currently underway, performs the characterization, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

The query (**:CALibration:YTF?**) invokes the alignment of the YTF subsystem, and returns a success or failure value.

A failure encountered during alignment generates the Error Condition message “Characterize Preselector failure” and sets Bit 3 in the **STATus:QUESTionable:CALibration:EXTended:FAILure** status register. Successful completion of **Characterize Preselector** clears this Condition. It also begins the elapsed time counter for Last Characterize Preselector Time, and captures the Last Characterize Preselector Temperature.

The last Characterize Preselector Time and Temperature survives across the power cycle, as this operation is performed infrequently.

NOTE

The **Characterize Preselector** function can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the **:ABORT SCPI** command. None of the new characterization data is then used. However,

since the old characterization data is purged at the beginning of the characterization, you now have an uncharacterized preselector. You should re-execute this function and allow it to finish before making any further preselected measurements.

Remote Command	<code>:CALibration:YTF</code> <code>:CALibration:YTF?</code>
Example	<code>:CAL:YTF</code>
Notes	<p><code>:CALibration:YTF?</code> returns 0 if successful, or 1 if failed (including interfering user signal)</p> <p>While Advanced, Characterize Preselector is performing the alignment, Bit 0 in the Status Operation register is set. Completion, or termination, clears Bit 0 in the Status Operation register</p> <p>This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <code>:ABORT</code> command</p> <p>Successful completion clears Bit 9 in the Status Questionable Calibration register</p> <p>A failure encountered during alignment generates the Error Condition message “Characterize Preselector failed” and sets Bit 9 in the Status Questionable Calibration register</p> <p>For Options that support frequencies > 3.6 GHz only</p>
Dependencies	This control does not appear in models that do not contain preselectors. In these models the SCPI command is accepted without error, but no action is taken
Couplings	<p>Initializes the time for the Last Characterize Preselector Time</p> <p>Records the temperature for the Last Characterize Preselector Temperature</p>
Remote Command	<code>:CALibration:YTF:NPENding</code>
Example	<code>:CAL:YTF:NPEN</code>
Notes	<p><code>:CALibration:YTF:NPENding</code> is the same as <code>:CALibration:YTF</code>, including all conditions, status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query if the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> 1. <code>:CALibration:YTF:NPENding</code> (Start a YTF calibration) 2. <code>:STATus:OPERation:CONDition?</code> (Check if the calibration is completed or not, If Bit 0 is set, then the system is doing calibration, and you should repeat this query until the bit is cleared) 3. <code>:STATus:QUESTionable:CALibration:EXTended:FAILure:CONDition?</code> (Check whether Bit 2 is set. If this bit is set, that means there are some errors in previous internal source calibration)

4.7.6.2 Characterize Reference Clock

Calibrates the Reference Input Phase with the External Reference Output. This feature is only available when either option DP2 or B40 is present. It requires connecting the 10 MHz OUT to the EXT REF IN port with a BNC cable before running the characterization.

See ["Front panel guided calibration sequence" on page 2788](#)

Remote Command	<code>:CALibration:REference:CLOCK?</code>
Example	<code>:CAL:REF:CLOC:INIT?</code> connect cable <code>:CAL:REF:CLOC?</code> disconnect cable <code>:CAL:REF:CLOC:END?</code>
Notes	<code>:CALibration:REference:CLOCK?</code> returns 0 if successful, or 1 if failed
Dependencies	Option DP2 or B40
Couplings	Initializes the time for the Last Characterize Reference Clock Time Records the temperature for the Last Characterize Reference Clock Temperature. Expected to be run after <code>:CAL:REF:CLOC:INIT</code> , and before <code>:CAL:REF:CLOC:END</code>
Remote Command	<code>:CALibration:REference:CLOCK:INITialize?</code>
Example	<code>:CAL:REF:CLOC:INIT?</code>
Notes	Returns 0 if successful, or 1 if failed
Dependencies	Option DP2 or B40
Couplings	Expected to be run before sending <code>:CAL:REF:CLOC?</code> . This will stop the current measurement when it has completed (does not abort the current data acquisition), and prepare the instrument for the expected cabling
Remote Command	<code>:CALibration:REference:CLOCK:END?</code>
Example	<code>:CAL:REF:CLOC:END?</code>
Notes	Returns 0 if successful, or 1 if failed
Dependencies	Option DP2 or B40
Couplings	Expected to be run after sending <code>:CAL:REF:CLOC?</code> , and after removing the cable used in that Characterize Reference Clock step. This will resume any queued measurements, and concludes the reference clock characterization
Remote Command	<code>:CALibration:TIME:REference:CLOCK?</code>
Example	<code>:CAL:TIME:REference:CLOCK?</code>

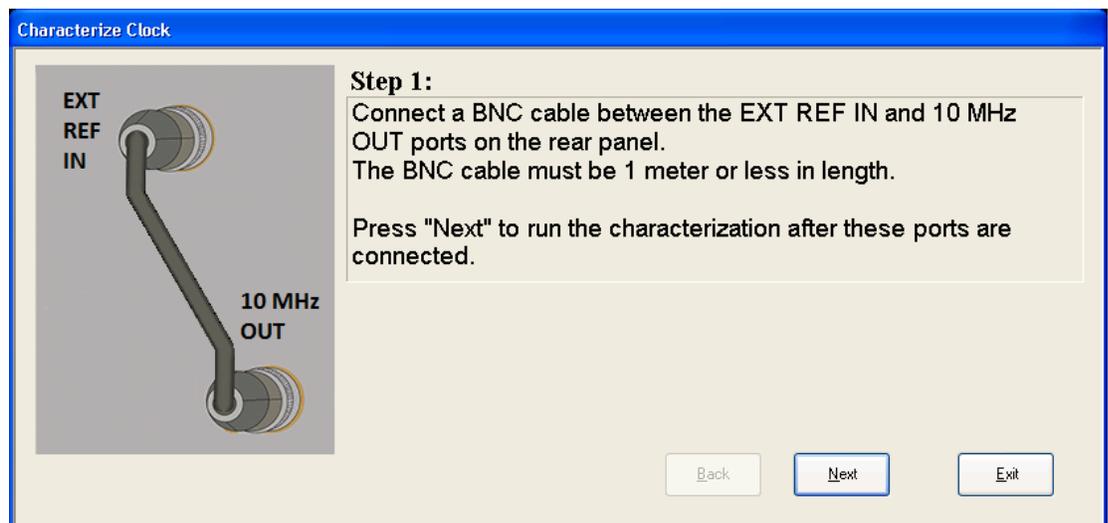

4 System
4.7 Alignments

Notes	Value is the date and time the last successful Characterize Reference Clock was executed. The date is separated from the time by a space character. Returns "" if Characterize Reference Clock has never been performed on the instrument
Dependencies	Option DP2 or B40
State Saved	No

Front panel guided calibration sequence

When selecting **Characterize Reference Clock** via the front panel, the following form is displayed.

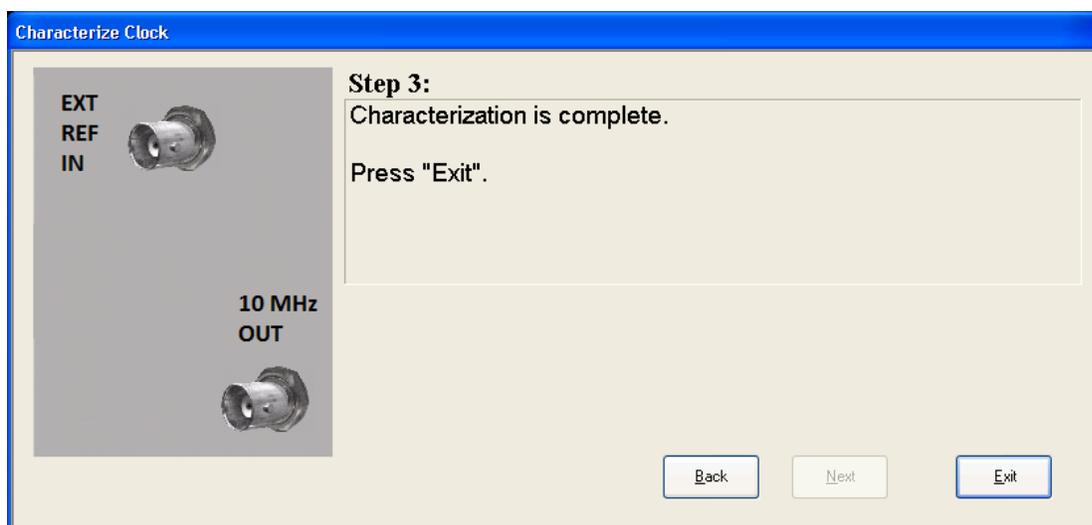

Step 1 of the guided calibration sequence:

Step 2 of the guided calibration sequence:

Step 3 of the guided calibration sequence:

4.7.6.3 Characterize Noise Floor

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. To do this, press **Characterize Noise Floor**. When you press this control, the instrument stops any measurement currently underway, and a dialog appears with an **OK** and **Cancel** button that says:

This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel

When you press **Enter** or **OK**, the characterization proceeds. After the characterization, the instrument restarts the measurement from the beginning

(similar to pressing the **Restart** key). The characterization takes many minutes to run.

The noise floor model used by Noise Floor Extensions includes an estimation of the temperature behavior of the noise floor, but this is only an estimation. The noise floor changes little with the age of the components. However, even small changes in the estimated level of the noise floor can make large changes in the effective noise floor, because the effective noise floor is the error in the estimation of the noise floor. Keysight recommends that the **Characterize Noise Floor** operation be performed when the instrument is operating at an ambient temperature that is significantly different than the ambient temperature at which this alignment was last run. In addition, Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, and once every calendar year.

The noise floor model from the last operation of **Characterize Noise Floor** survives across the power cycle.

NOTE

The **Characterize Noise Floor** function can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the `:ABORT SCPI` command. None of the new characterization data is then used. However, since the old characterization data is purged at the beginning of the characterization, you now have an uncharacterized noise floor. You should re-execute this function and allow it to finish before making any further measurements with NFE. Until you do, the instrument will display a “Characterize Noise Floor required” message and set bit 12 in the Status Questionable Calibration register (`STATus:QUEStionable:CALibration:EXTended:NEEDed`).

Remote Command	<code>:CALibration:NFLoor</code> <code>:CALibration:NFLoor?</code>
Example	<code>:CAL:NFL</code>
Notes	<code>:CALibration:NFLoor?</code> returns 0 if successful, or 1 if failed (including interfering user signal) This command is sequential; it must complete before further commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <code>:ABORT</code> command
Dependencies	This control does not appear in models that do not contain NF2. In these models the command is accepted without error, but no action is taken
Couplings	Successful completion of Characterize Noise Floor begin the elapsed time counter or the Last Characterize Noise Floor Time
Remote Command	<code>:CALibration:TIME:NFLoor?</code>
Example	<code>:CAL:TIME:NFL?</code>
Notes	Value is the date and time the last successful Characterize Noise Floor was executed. The date is separated from the time by a space character Returns "" if no Characterize Noise Floor has ever been performed on the instrument

Dependencies	In models that do not include NF2, this command is not enabled and any attempt to set or query yields an error
State Saved	No
Remote Command	<code>:CALibration:TEMPerature:NFLoor?</code>
Example	<code>:CAL:TEMP:NFL?</code>
Notes	Value is the temperature of the last successful Characterize Noise Floor was executed Returns "" if no Characterize Noise Floor has ever been performed on the instrument
Dependencies	In models that do not include NF2, this command is not enabled and any attempt to set or query yields an error
State Saved	No
Remote Command	<code>:CALibration:TIME:ELAPsed:NFLoor?</code>
Example	<code>:CAL:TIME:ELAP:NFL?</code>
Notes	Value is the elapsed time the instrument was powered-on since the last successful Characterize Noise Floor was executed Returns "" if no Characterize Noise Floor has ever been performed on the instrument
Dependencies	In models that do not include NF2, this command is not enabled and any attempt to set or query yields an error
State Saved	No

4.7.6.4 TDS Alignment

This function only appears in N9038B (MXE-B) when Option TDS is installed and licensed.

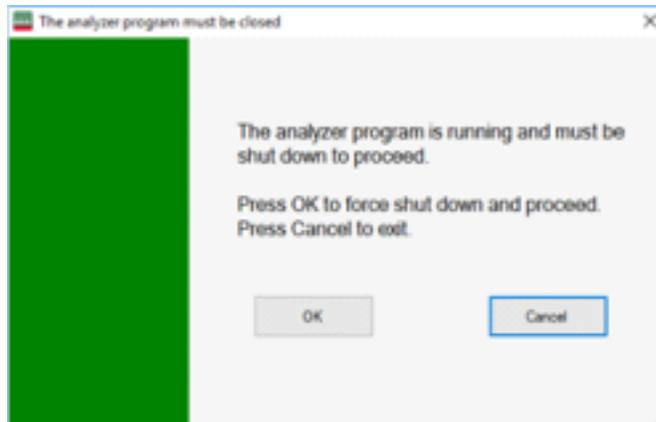

The TDS alignment includes **AlignNowAll** and **RFPresel** alignment. Immediately executes an alignment of the TDS subsystem. The instrument stops any measurement currently underway, performs the alignment, and then restarts the measurement from the beginning (similar to pressing the Restart key).

Align TDS can be interrupted by pressing the **Cancel (ESC)** front-panel key or from remote with Device Clear followed by the **:ABORT** command. When this occurs, no new TDS alignment data will be employed.

Remote Command	<code>:CALibration:TDS</code> <code>:CALibration:TDS?</code>
Example	<code>:CAL:TDS</code>
Notes	This command is sequential; it must complete before further commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the :ABORT command
Dependencies	This control only appear in N9038B (MXE-B) models with Option TDS installed and licensed

4.7.7 Backup or Restore Align Data...

Opens the utility for backing-up or restoring alignment data. Since this utility cannot be run while the instrument software is running, a prompt tells you to shut down the instrument first:

Press **OK** and the instrument will shut down and open the backup utility.

Alignment data for the instrument resides on the hard drive in a database. Keysight uses high quality hard drives; however, it is highly recommended the alignment data be backed-up to storage outside of the instrument. Additionally, for customers who use multiple CPU Assemblies or multiple disk drives, the alignment that pertains to the instrument must be transferred to the resident hard drive after a CPU or hard drive is replaced. This utility facilitates backing-up and restoring the alignment data.

NOTE

This utility allows you to navigate to any location of the Windows file system. If you are backing up alignment data to storage outside of the instrument, then it is assumed that you will use a USB memory device, or Mapped Network Drive.

Processor Assembly types PC6 and PC7 contain a removable SD memory card. When one of these CPUs is installed, the Backup and Restore Alignment Data wizard defaults to the SD card as the backup location. At every power-on, the software will check to determine if the calibration data on the SD memory card (the backup) is newer than the data in use on the disk. In such situations, before the application is loaded, you are given the opportunity to restore the data from the backup. If you respond **Yes**, the Backup and Restore Alignment Data wizard (see "[Alignment Data Wizard \(without Flash\)](#)" on page 2793) will be invoked to perform the restore.

Processor Assembly types PC6S and PC7S contain an internal flash EEPROM, as well as a removable SD card. When one of these CPUs is installed, the Backup and Restore Alignment Data wizard defaults to the internal flash as the backup location.

As with the PC6 and PC7, at every power-on, the software compares the timestamp of the backup on the flash and the timestamp of the alignment data in use on the disk. If the backup on the flash has newer data, you are given the opportunity to restore the data from the backup before the application is loaded. If you respond **Yes**, the Backup and Restore Alignment Data wizard (see "[Alignment Data Wizard \(with Flash\)](#)" on page 2803) will be invoked and will prompt you to restore that backup.

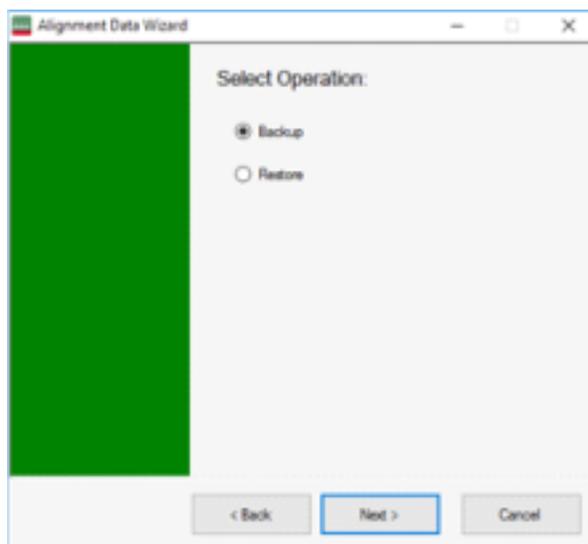

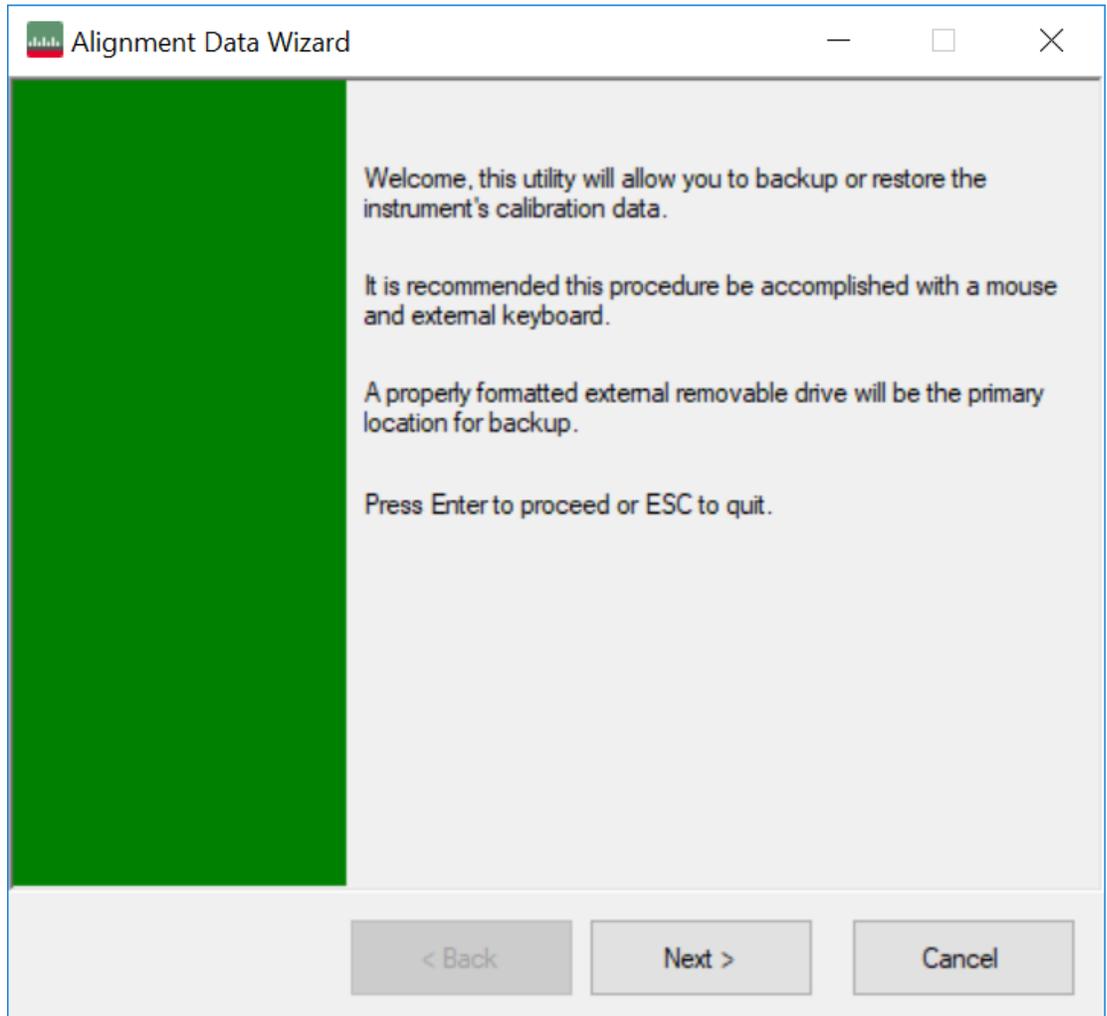

For purposes of these instructions, "alignment data" and "calibration data" are used interchangeably.

Dependencies	Not available in UXM
Remote Command	<code>:CALibration:DATA:DEFault</code>
Example	<code>:CAL:DATA:DEF</code>
Notes	Restores the alignment data files to their default state
Couplings	Sets Auto Align to OFF . Sets Bit 14 in the Status Questionable Calibration register. The Error Condition message "Align Now All required" is generated

4.7.7.1 Alignment Data Wizard (without Flash)

Guides you through the operation of backing-up or restoring the alignment data.

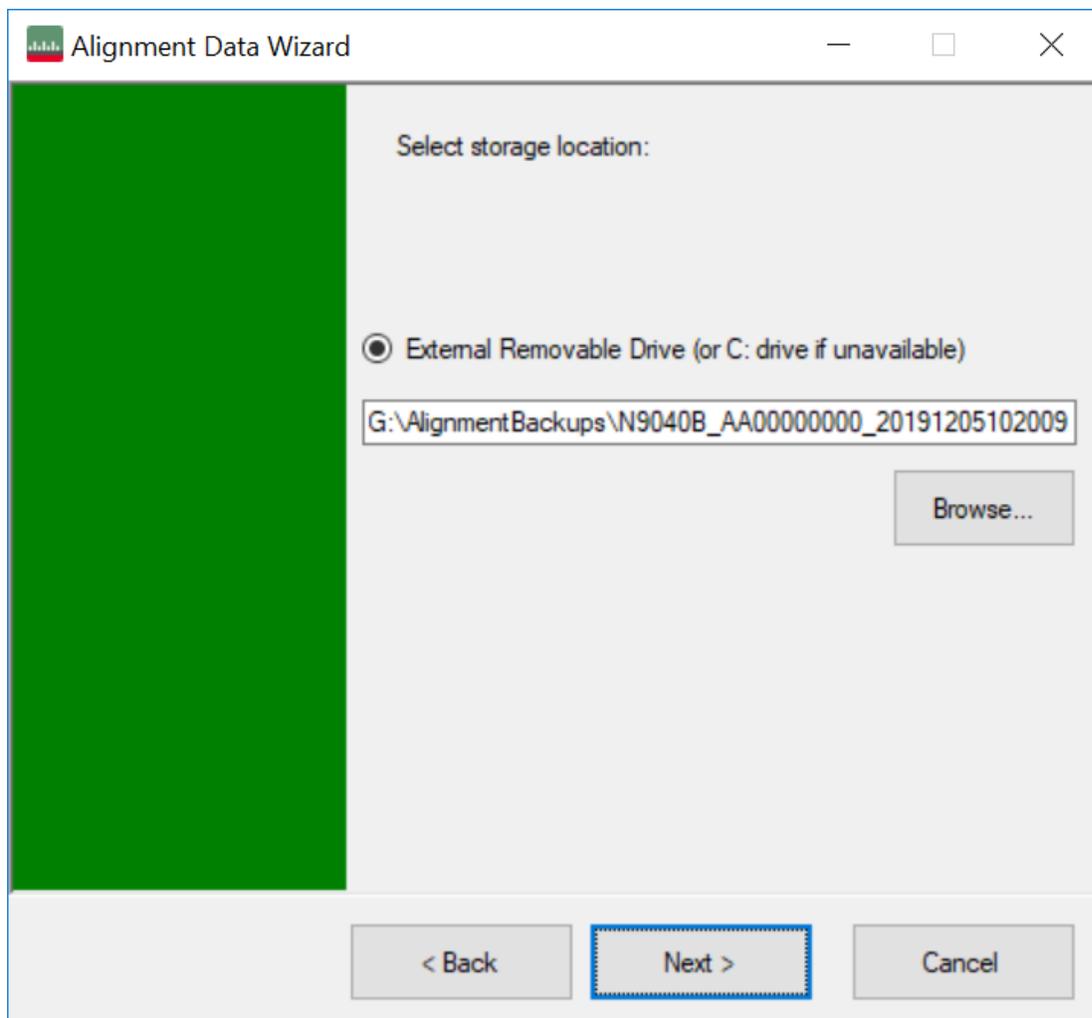

4 System
4.7 Alignments

The default backup location for instruments *without* internal flash will be the first drive identified as an external drive (USB or LAN) if such is available; or, if not, the internal D: partition.

The default file name is `<model number>_<serial number>_<date in YYYYMMDDHHMMSS>.bkz`.

The default file extension for legacy backup files was `.bak`. The Backup and Restore operations support both the `.bak` (legacy format) and `.bkz` formats.

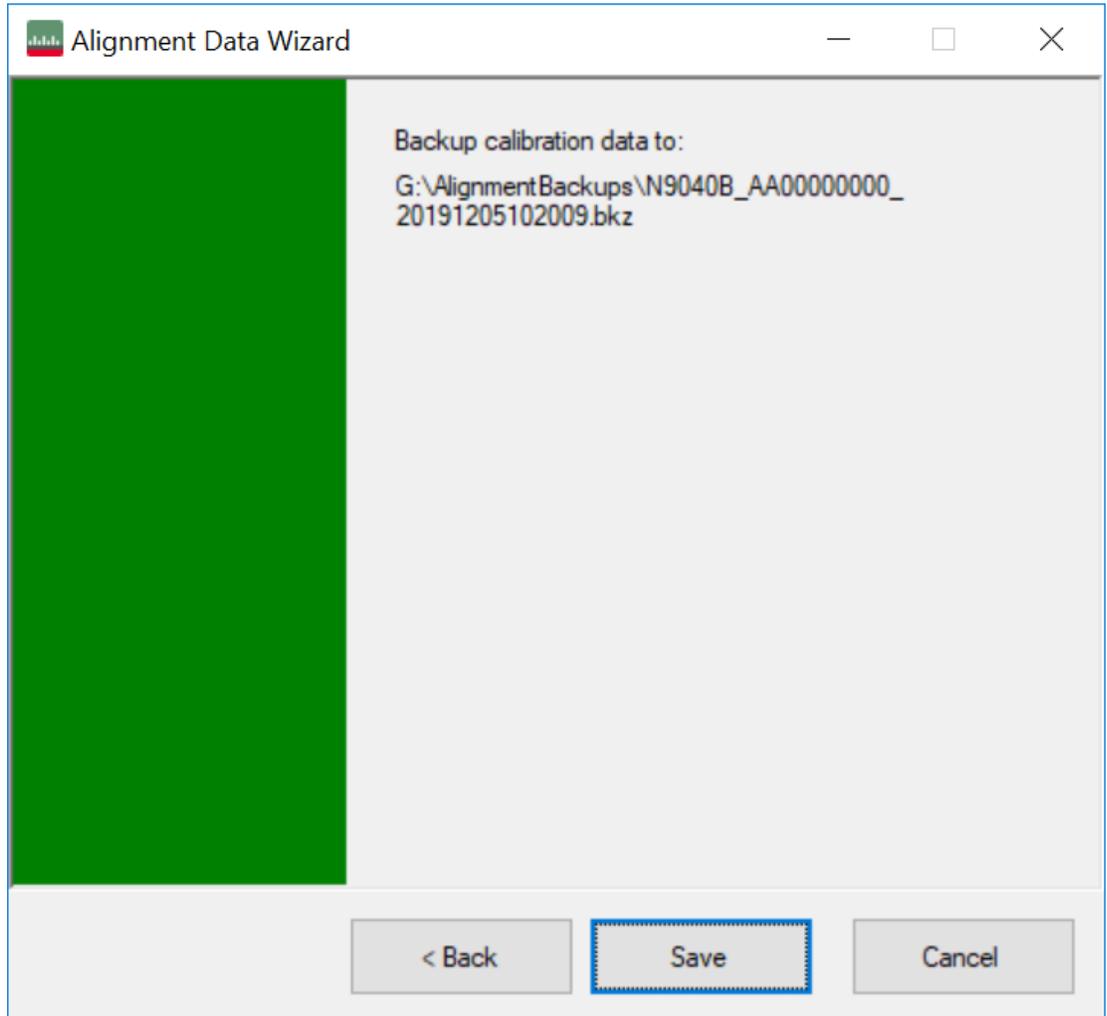

If a USB drive is present, it will be selected by default. The path defaults to the `AlignmentBackups` folder, and a filename is automatically created, in the form: `<model>_<serial number>_<date><time>.bkz`

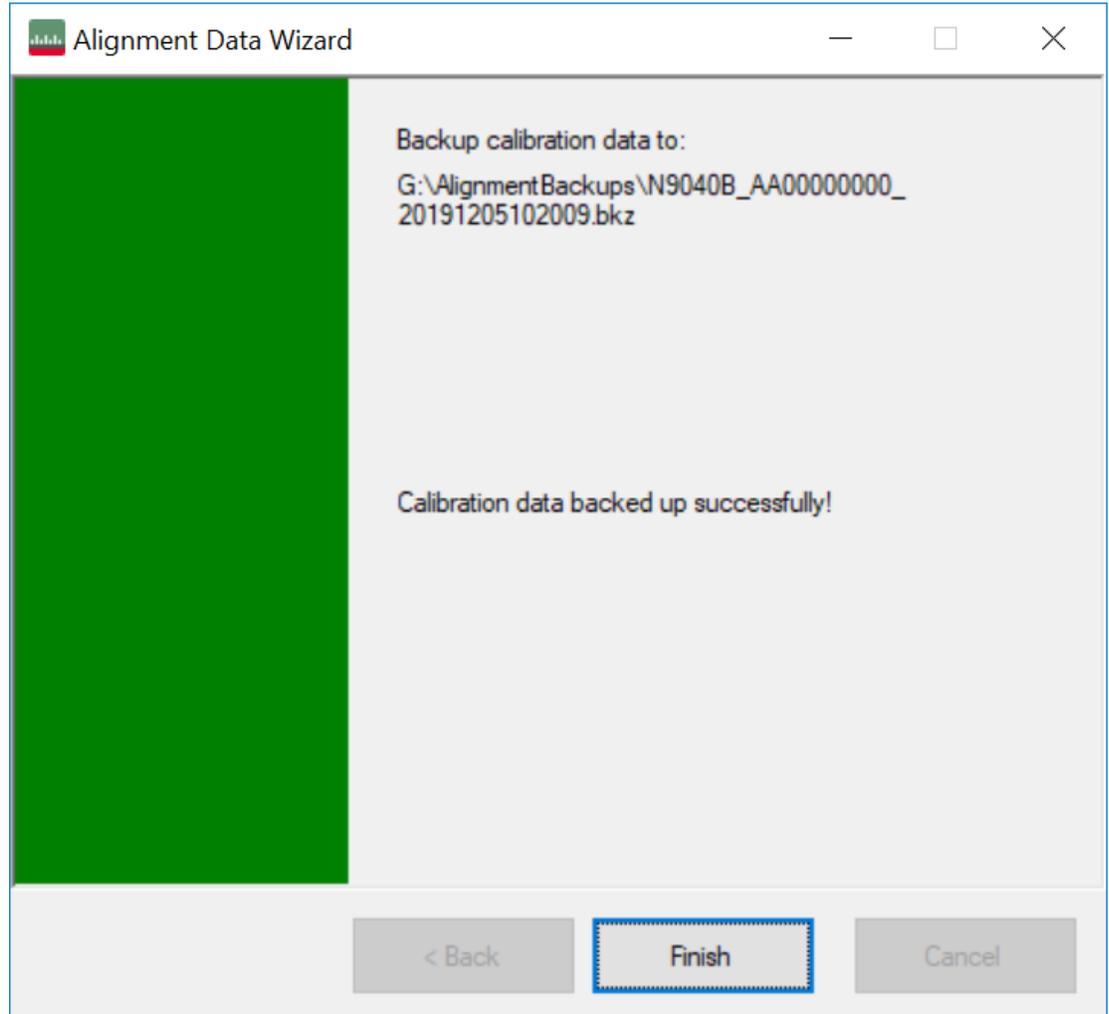

If you wish to enter a customer filename, you can do so with an external keyboard, or by opening the onscreen Alpha keyboard, by pressing the **Keyboard** hardkey on the front panel:

4 System
4.7 Alignments

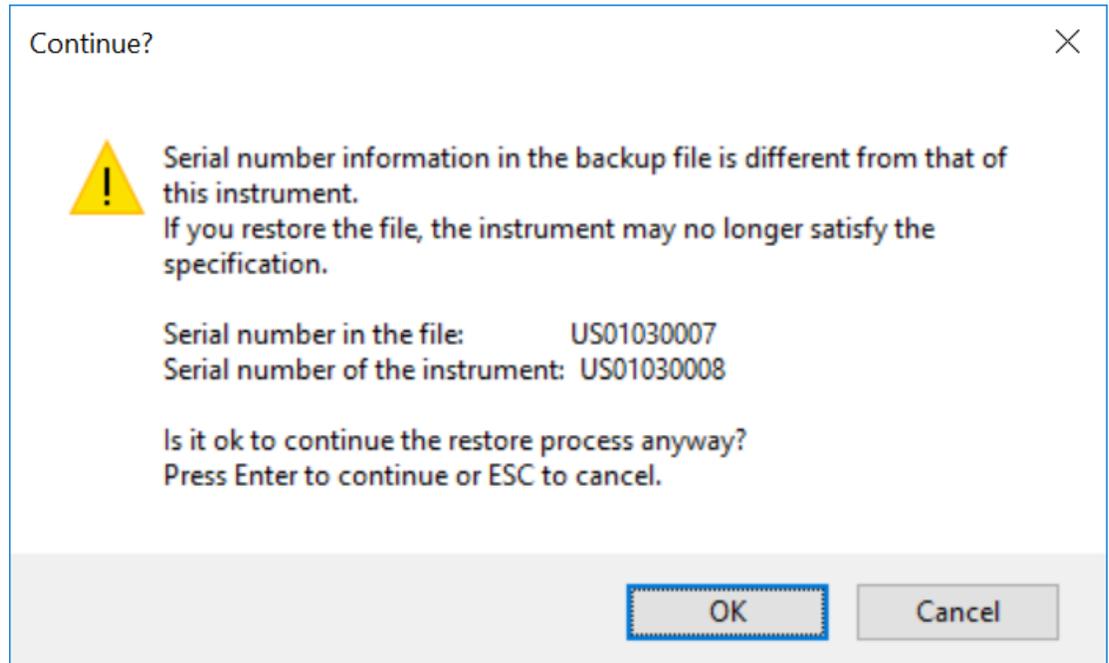

When the **Next >** button is pressed, you will be prompted to create a new folder if the chosen path does not yet exist.

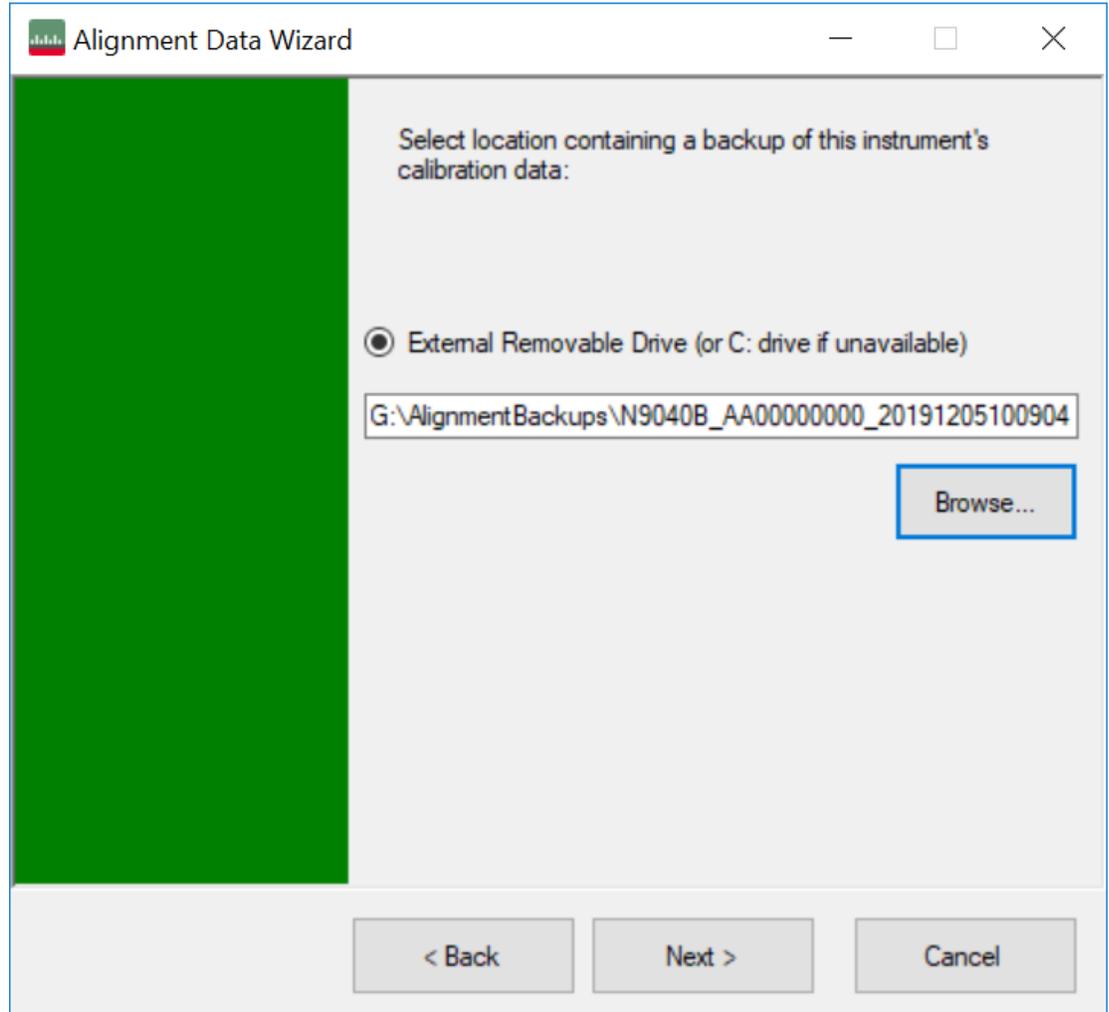

The restore operation checks the validity of the restore file using the database's built-in file validation. If the restore file is corrupt, the existing alignment data will remain in use.

If the serial number information in the backup file being restored is different from that of the instrument, the following message appears (the serial numbers shown are examples):

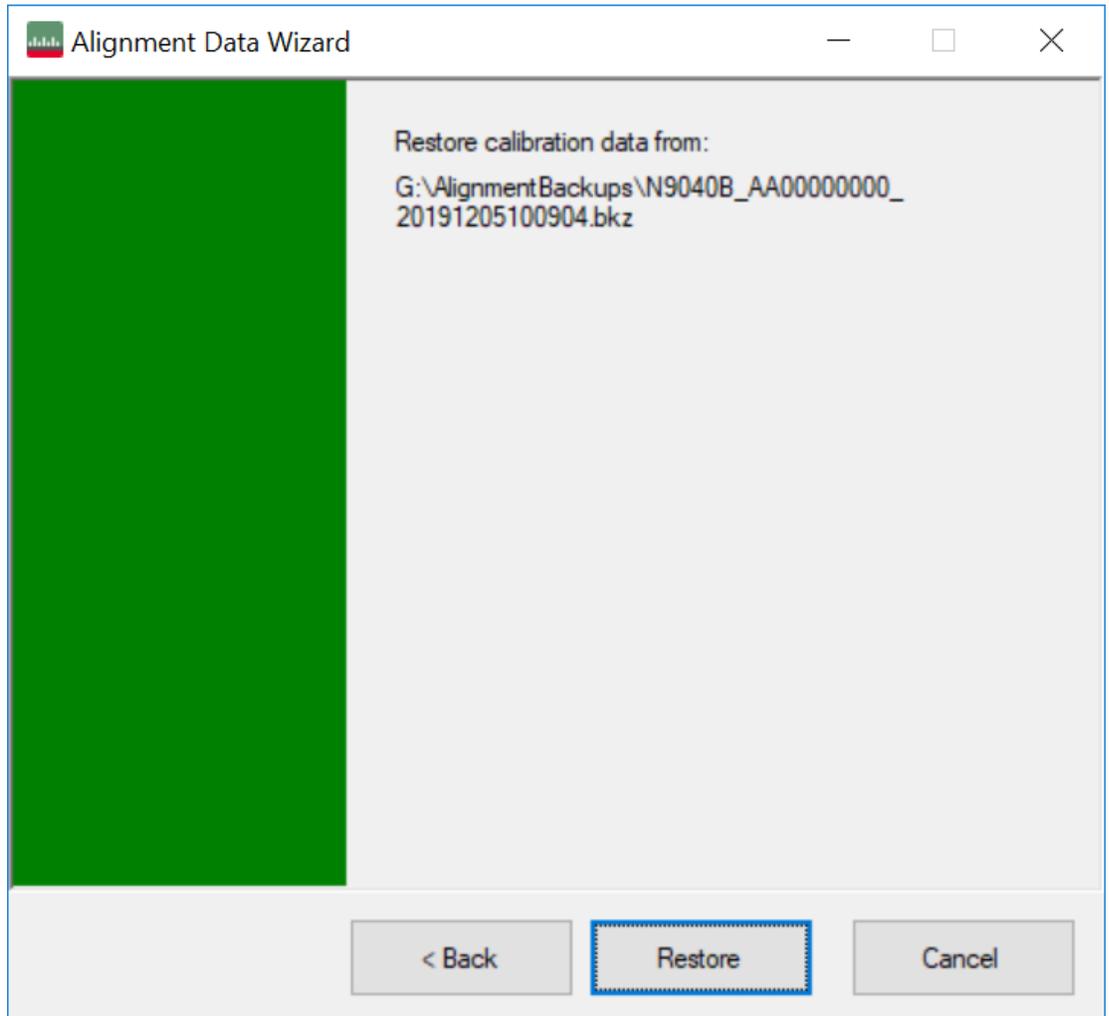

The default restore location for instruments *without* internal flash will be the first drive identified as an external drive (USB or LAN) if such is available; or, if not, the internal D: partition. The default restore file will be the most recent file that matches the default backup file name format: `<model number>_<serial number>_<date>.bkz`

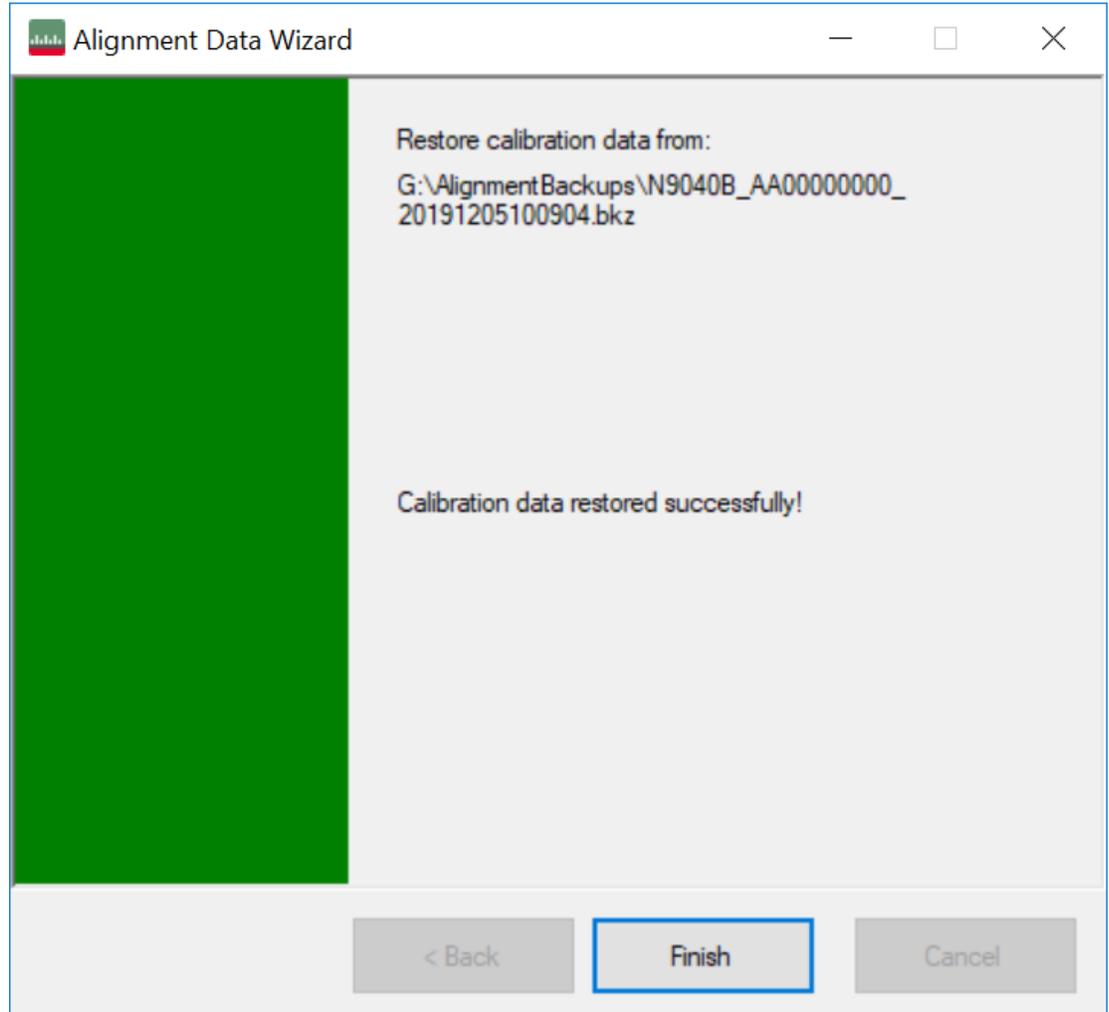

Changing the drive letter also modifies the path displayed in the box below. When this step is first loaded, the drive drop-down menu is populated with connected drives, which provide you with read access.

The path defaults to the [AlignBackups](#) folder. The most recent backup (*.bkz or *.bak) file in the folder will also be selected by default.

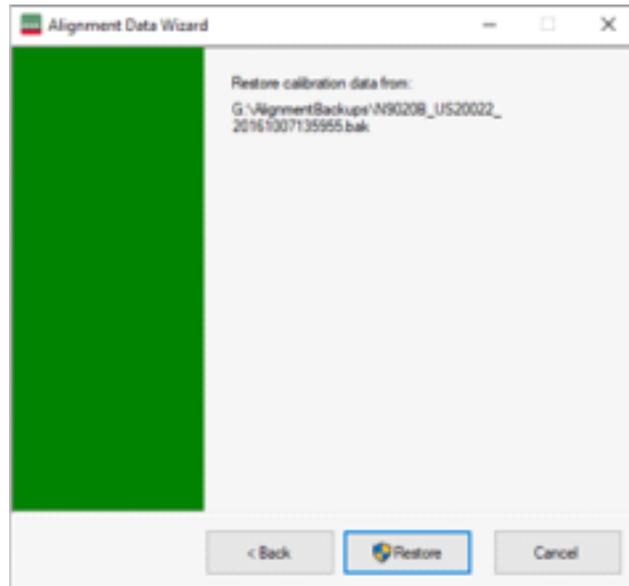

4 System
4.7 Alignments

When restoring data in the legacy `.bak` format, Administrator privileges are required. You will be prompted when you attempt a restore (indicated by the UAC Shield on the **Restore** button below).

4 System
4.7 Alignments

4.7.7.2 Perform Backup (without Flash) (Remote Command Only)

Invokes an alignment data backup operation to the provided Folder.

NOTE

It is recommended that the Folder provided is outside of the instrument (USB or Mapped Network Drive).

Remote Command `:CALibration:DATA:BACKup <filename>`

Example `:CAL:DATA:BACK "F:\AlignDataBackup_N9020A_US00000001_2008140100.bkz"`

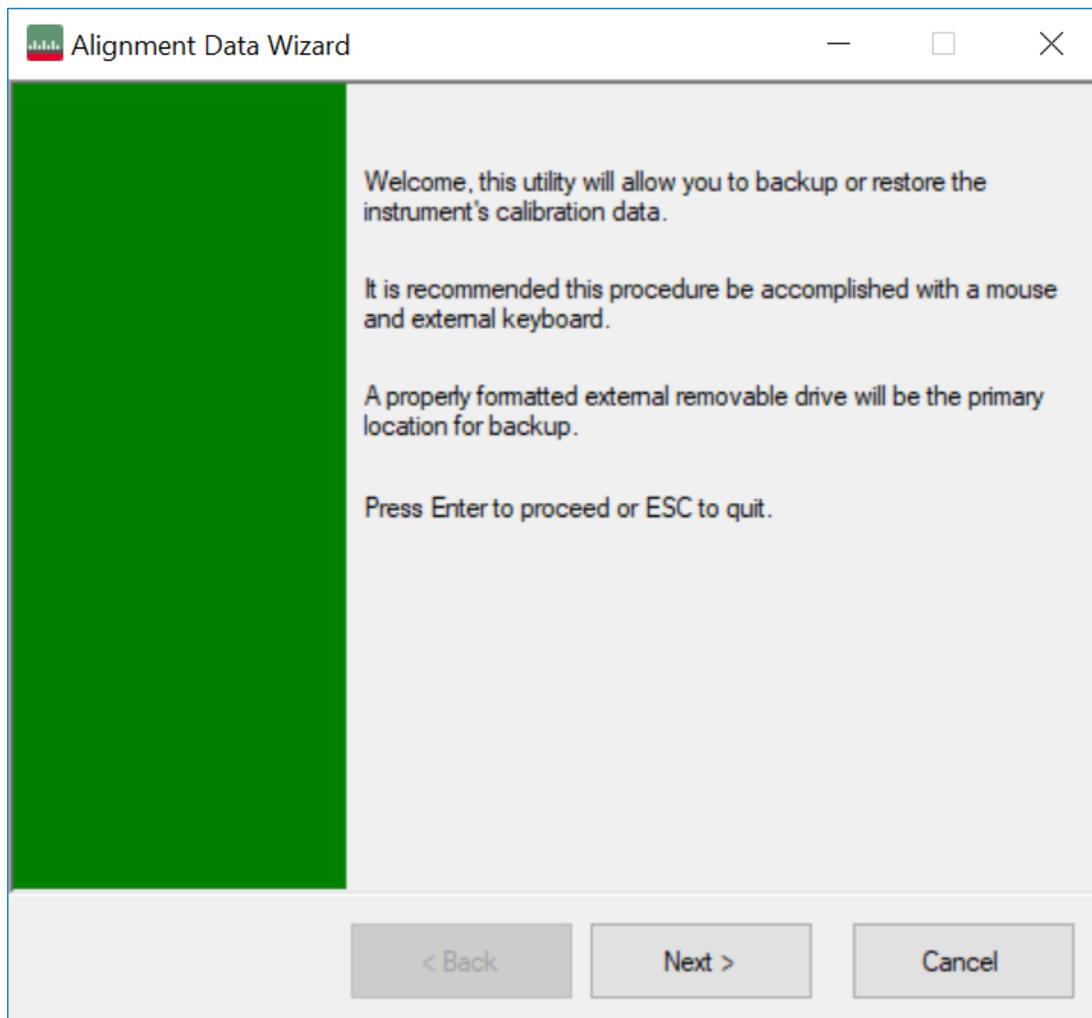

4.7.7.3 Perform Restore (without Flash) (Remote Command Only)

Invokes an alignment data restore operation from the provided filename.

Remote Command `:CALibration:DATA:RESTore <filename>`

Example `:CAL:DATA:REST "F:\ AlignDataBackup_N9020A_US00000001_2008140100.bkz"`

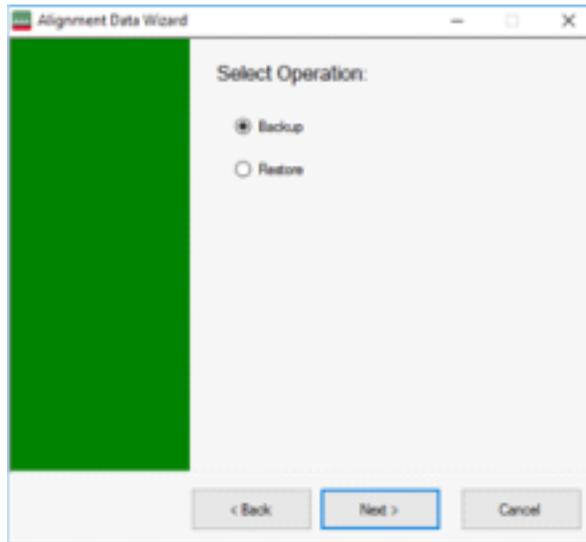

4.7.7.4 Alignment Data Wizard (with Flash)

If your instrument has Processor Assembly type PC6S or PC7S (see ["Show System" on page 2688](#)) the instrument has an internal flash EEPROM that can store a backup of the alignment data. In this case, the interface to the Alignment Data Wizard is enhanced to accommodate this internal storage. This section details the use of this internal flash. For details on using external storage, see the previous section (["Alignment Data Wizard \(without Flash\)" on page 2793](#)).

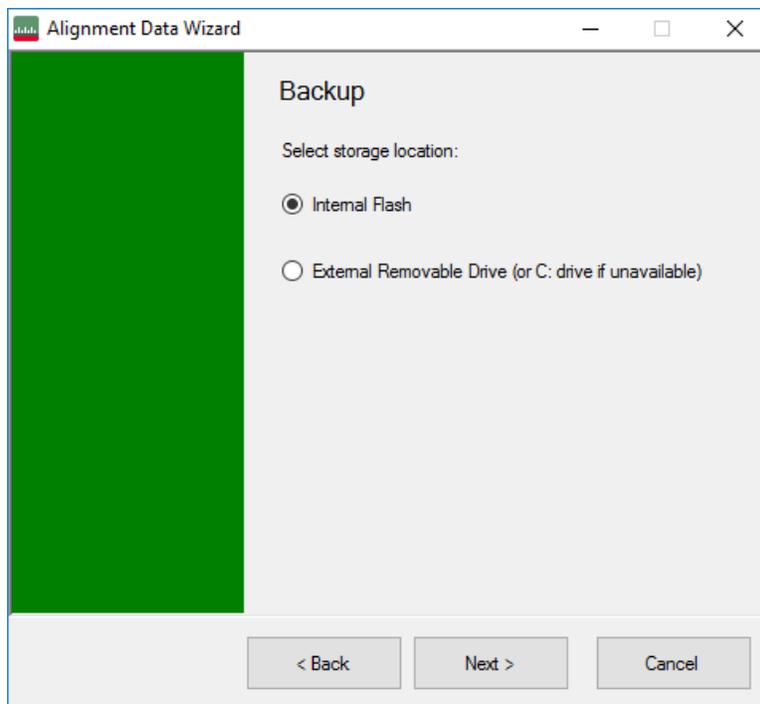

The Alignment Data Wizard guides you through the operations of backing up or restoring alignment data.

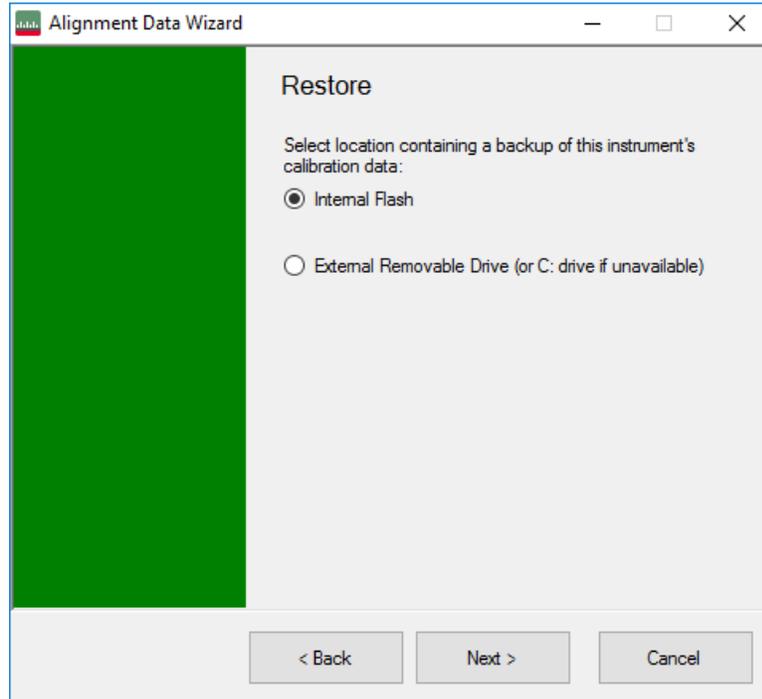

4 System
4.7 Alignments

Having selected **Backup** or **Restore**, you then select the source or destination for the alignment data. As shown below, you can select either:

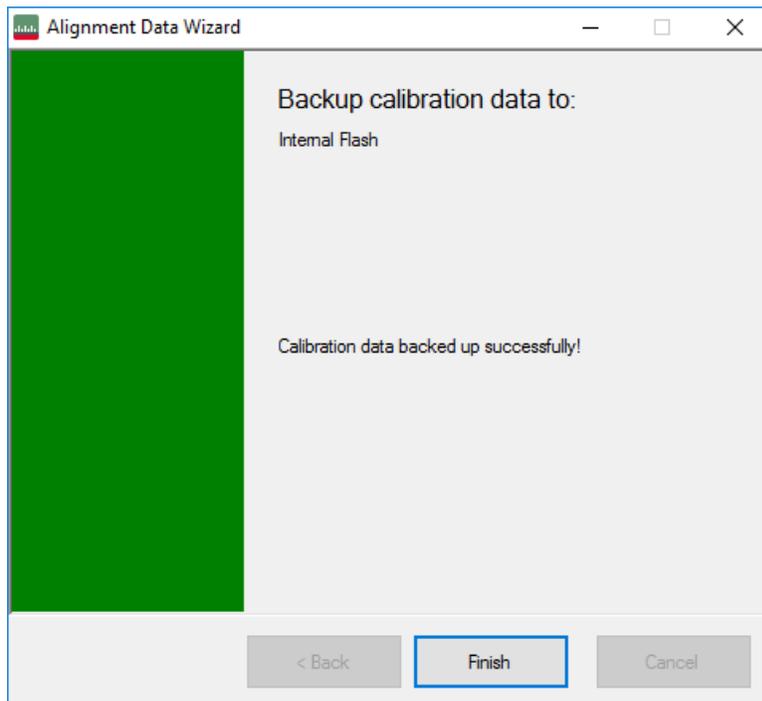

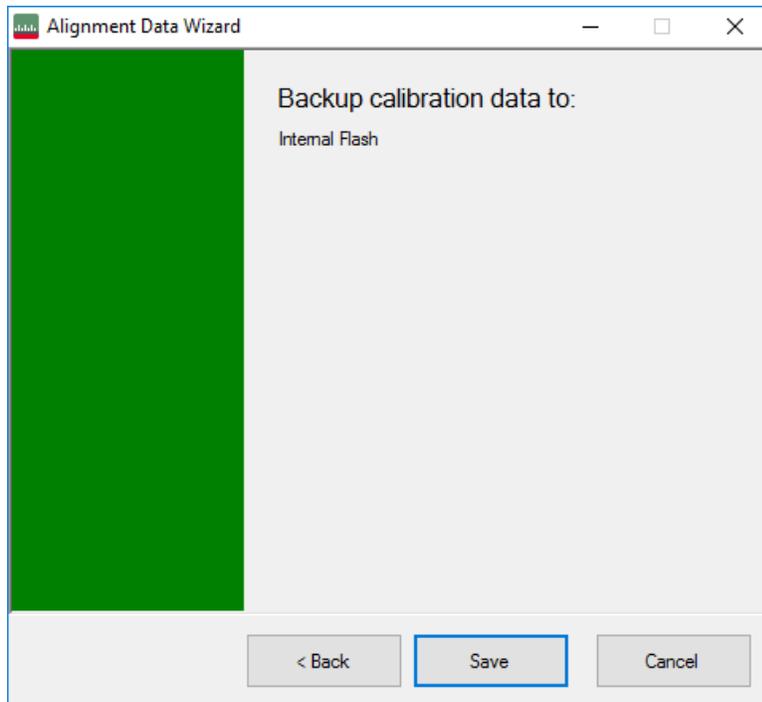

- Internal flash EEPROM, or,
- External Removable Drive (which includes the SD card described in "[Backup or Restore Align Data...](#)" on page 2792)

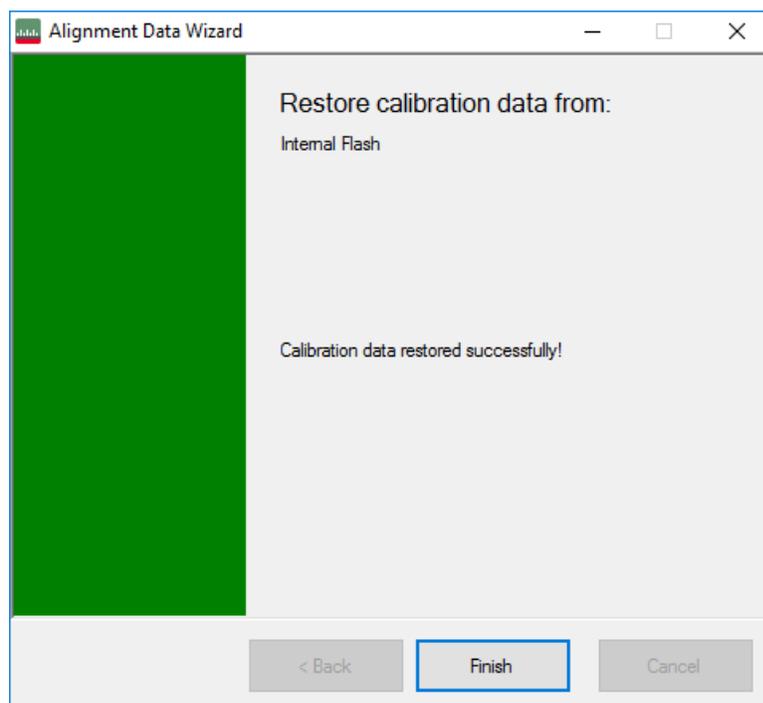

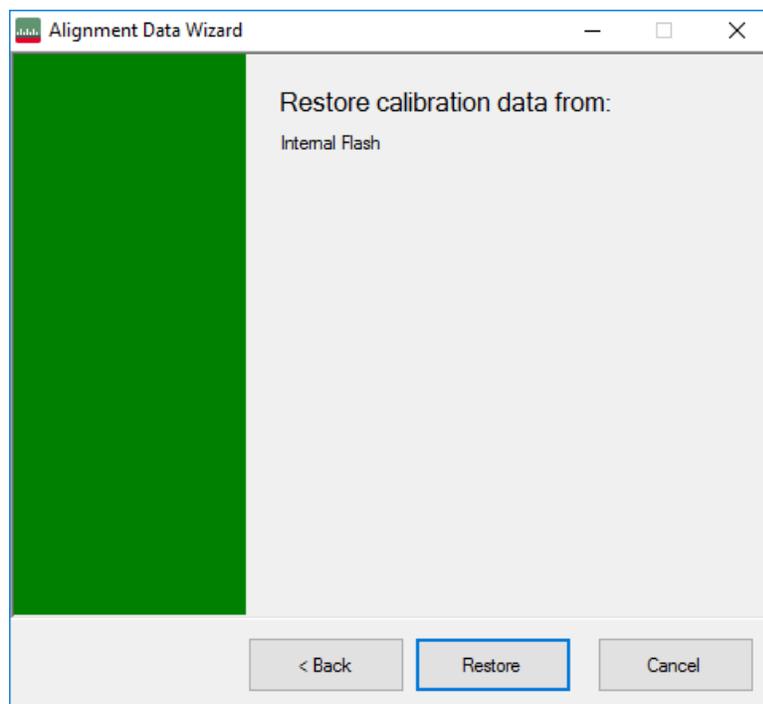

The final page of the wizard asks you to confirm the choices made in the previous pages. When the operation is complete, an indication is displayed on the same page, as below.

Backup:

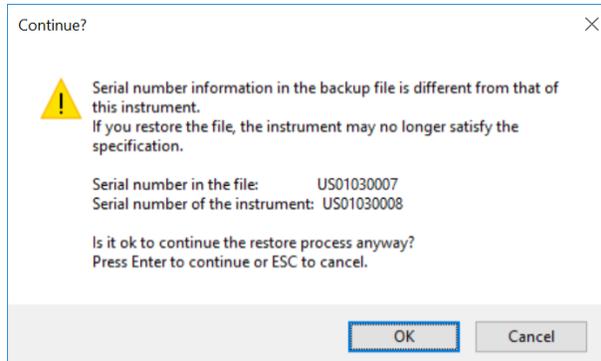

Restore:

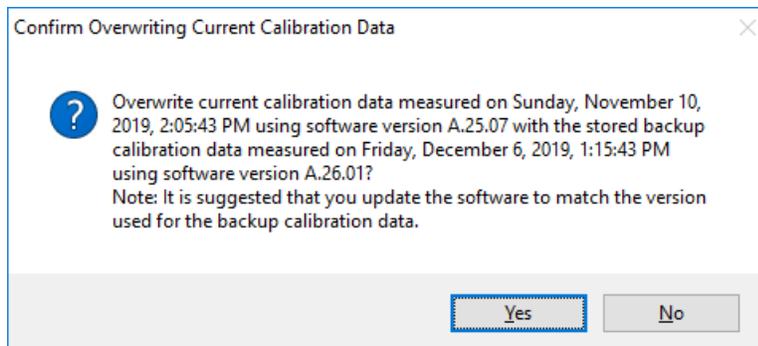

4 System

4.7 Alignments

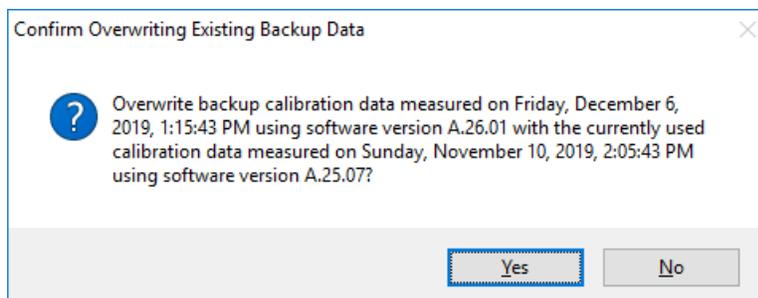

When restoring alignment data, if the serial number information in the backup file being restored is different from that of the instrument, the following message appears (the serial numbers shown are examples):

Immediately before the actual restoration, a final confirmation message is displayed detailing what is being restored and the current database that will be overwritten on the disk (the dates and versions are examples):

When backing up alignment data to the flash, if there is already an existing backup on the flash, a final confirmation message is displayed detailing what is being backed up and what will be overwritten on the flash (again, the dates and versions are examples):

4.7.7.5 Perform Backup (with Flash) (Remote Command Only)

Invokes an alignment data backup operation to the internal flash EEPROM.

Remote Command :CALibration:DATA:INTernal:BACKup

Example :CAL:DATA:INT:BACK

4.7.7.6 Perform Restore (With Flash) (Remote Command Only)

Invokes an alignment data restore operation from the internal flash EEPROM.

Remote Command :CALibration:DATA:INTernal:RESTore

Example :CAL:DATA:INT:REST

4.7.8 Restore Alignment Defaults

Causes the Alignment system settings to be reset to their default values. This does not affect any Alignment data stored in the system.

After performing this function, it may impact the auto-alignment time of the instrument until a new alignment baseline has been established.

When **Alignments** is selected, a message appears saying:

This will reset all of the settings for the Alignment system to their default values

No alignment data will be erased

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

Align Now All must be executed if the value of the Timebase DAC results in a change.

Example :SYST:DEF ALIG

Notes Alignment processing that results as the transition to **Auto Align Normal** will be executed sequentially; thus ***OPC?** or ***WAI** will wait until the alignment processing is complete

The parameters affected are:

Parameter	Setting
Timebase DAC	Calibrated
Timebase DAC setting	Calibrated value
Auto Align State	Normal (if the instrument is not operating with default alignment data, Off otherwise)
Auto Align All but RF	Off
Auto Align Alert	Time & Temperature

4.8 Security

Accesses capabilities for operating the instrument in a security-controlled environment.

The **Security** page of the **System** menu has two controls: **USB Read/Write** and **Restore Security Defaults**.

Dependencies	Not available in UXM
--------------	----------------------

4.8.1 USB Write Protect

The Windows operating system can be configured to disable write access to the USB ports for users who are in a secure environment where transferring data from the instrument is prohibited. The **USB Write Protect** control is a convenient way for you to disable write access to USB.

NOTE

This control is only available to users with Administrator privileges.

Remote Command	<code>:SYSTem:SECurity:USB:WPRotect[:ENABle] ON OFF 0 1</code> <code>:SYSTem:SECurity:USB:WPRotect[:ENABle]?</code>
----------------	--

Example	<code>:SYST:SEC:USB:WPR ON</code> Sets USB ports to Read-only <code>:SYST:SEC:USB:WPR OFF</code> Sets USB ports to Read-Write
---------	--

Notes	When the USB ports are in Read-only mode, then no data can be stored to USB, including the internal USB memory used for a back-up location for the calibration data
-------	---

Dependencies	This control is grayed-out unless the current user has Administrator privileges
--------------	---

Preset	This is unaffected by Preset or any Restore System Defaults . A Keysight Recovery sets the USB to write protect OFF
--------	--

State Saved	No
-------------	----

Range	Read-Write Read only
-------	------------------------

4.8.2 Restore Security Defaults

Sets USB Read/Write to Enable.

NOTE

This control is only available to users with Administrator privileges.

4.9 Diagnostics

Displays a slider that allows you to view Hardware Statistics.

Dependencies	Not available in UXM
--------------	----------------------

4.9.1 Show Hardware Statistics

Provides a display of various hardware statistics. The statistics include the following:

- Mechanical relay cycles (on models with mechanical relays)
- High and Low temperature extremes
- Elapsed time that the instrument has been powered-on (odometer)

Modular instruments display only time and temperature information.

Example	<code>:SYST:SHOW HWST</code>
---------	------------------------------

Notes	The values displayed on the screen are only updated upon entry to the screen and not updated while the screen is being displayed
-------	--

4.9.2 Pathwave Calibration Advisor...

PathWave Calibration Advisor is a separate application that helps maintain your instrument at peak performance. You can set the cal interval, configure cal due reminders, check the cal status, view cal certificates and test reports, and contact Keysight for a cal service.

4.9.3 Query the Mechanical Relay Cycle Count (Remote Command Only)

Returns the count of mechanical relay cycles.

Remote Command	<code>:SYSTem:MRELay:COUNT?</code>
----------------	------------------------------------

Example	<code>:SYST:MREL:COUN?</code>
---------	-------------------------------

Notes	Query Only
-------	------------

The return value is a comma separated list of the individual counts for each mechanical relay

The position of the relays in the list is:

`"<Cal Signal>,<AC/DC>,<2dB #1 Atten>,<2dB #2 Atten>,<6dB Atten>,<10dB Atten>,<20dB Atten>,<30dB Atten>,<Fixed Atten>,<Low Noise Path`

`Switch>,<Prese1 Bypass>”`

Items in the list not pertaining to your hardware configuration return as `-999` for those items

Dependencies This command is *not* supported by the E6607C model

4.9.4 Query the Operating Temperature Extremes (Remote Command Only)

Returns the low operating temperature extreme value. The value survives a power-cycle and is the temperature extreme encountered since the value was reset by the factory or service center.

Remote Command `:SYSTem:TEMPerature:LEXTreme?`

Example `:SYST:TEMP:LEXT?`

Notes Value is in degrees Celsius at which the lowest operating temperature has been recorded since 1st power-up

State Saved No

Returns the high operating temperature extreme value. The value survives a power-cycle and is the temperature extreme encountered since the value was reset by the factory or service center.

Remote Command `:SYSTem:TEMPerature:HEXTreme?`

Example `:SYST:TEMP:HEXT?`

Notes Value is in degrees Celsius at which the highest operating temperature has been recorded since 1st power-up

State Saved No

4.9.5 Query the Elapsed Time since 1st power on (Remote Command Only)

Returns the elapsed on-time in minutes since 1st power-on.

Remote Command `:SYSTem:PON:ETIMe?`

Example `:SYST:PON:ETIM?`

Notes Query Only

4.10 Licensing

Accesses capabilities for configuring the licenses in your instrument.

4.10.1 License Manager

Opens the License Explorer for Fixed and Transportable licenses.

NOTE

This feature is not available if option SF1 is installed.

For help on licensing, select **Help** in the menu bar at the top of the License Explorer window.

There are also five remote commands available for licensing. See:

- ["Install License \(Remote Command Only\)" on page 2821](#)
- ["Remove License \(Remote Command Only\)" on page 2821](#)
- ["List Licenses \(Remote Command Only\)" on page 2822](#)
- ["Validate License \(Remote Command Only\)" on page 2823](#)
- ["Host ID Query \(Remote Command Only\)" on page 2823](#)
- ["List Borrowed Licenses \(Remote Command Only\)" on page 2818](#)
- ["Return a Borrowed License \(Remote Command Only\)" on page 2819](#)

Notes

No equivalent remote command for this control

4.10.2 System Software Version Date

The software version date is the date of the newest features introduced in this release of the firmware. The date is not the same as the build date of the firmware because the date will only change when new features are added. For example, if A.18.06 has only defect fixes and no new features compared to A.18.05, then both A.18.05 and A.18.06 would have the same software version date.

For any feature to be enabled, the SW Support Expiration Date of the enabling license must be greater than or equal to the software version date when that feature was first introduced. See the Keysight web site for features related to a specific software application and their required support date.

The SCPI response is 3 integer values: `<year>`, `<month>`, `<day>`.

Remote Command :SYSTem:SOFTware:VERsion:DATE?

Example :SYST:SOFT:VERS:DATE?

4.10.3 Software Support Expiration Date

The **Software Support Expiration Date** is encoded in each software license's Version field in the **YYYY.MMDD** format. This gives the end date of the support contract associated with this license. When a support contract is renewed, a new license will be issued with an updated Version corresponding to the new contract's end date. The functionality available for a license is determined by the features available before the expiration date. For example, if feature X is introduced in a release with System Software Version Date of **2017.0831**, then a license with a Software Support Expiration Date of **2017.0831** or greater would enable feature X, but **2017.0830** or earlier would not enable feature X.

The SCPI response is 3 integer values: **<year>, <month>, <day>**.

Remote Command :SYSTem:LKEY:SOFTware:SUPPort:EXPIration:DATE? <feature>

Example :SYST:LKEY:SOFT:SUPP:EXP:DATE? "N9084EM0E-1FP"

Dependencies When **<feature>** is not a valid license, one of the following errors will be issued:

- -224, "IllegalParameterValue;License is not installed"
- -224, "IllegalParameterValue;Unknown license feature"
- -224, "IllegalParameterValue;Support contract not offered for this license"

4.10.4 Network Licenses

Network Licenses are available over the customer's network from a server the customer configures. The server has a count for each license and will only allow instruments to "check-out" a license up to that count. Once the count is reached for a specific license, further check-outs fail until one of the licenses is checked back in to the server. What this means is that it is possible for an instrument to have different features available to it based on what licenses are still available on the server when it tries to get licenses.

Setting up network licenses is done via the **Keysight Floating License Manager** (available on external Keysight web) and it has an Installation Guide that can be downloaded from that web page.

4.10.4.1 Application Licenses

Application Licenses (like N9077EM0E-1NP) are automatically checked out when entering the mode that uses them, and they are automatically checked-in when leaving that mode. Because the server may have already checked out the last license for the application to another instrument, there is now the possibility that a mode switch will fail because a required license could not be checked out from the server. If the server has a limited number of licenses compared to the number of users desiring to use that license, this may mean that switching from mode A to mode B then back to mode A may fail when returning to mode A because another instrument checked out the last available license while the user was in mode B. Also, for modes with multiple licenses for different features (like Multi-Standard Radio), the features available may also change when switching out of the mode and back into it.

So, when using network licenses, it is necessary to check `:SYST:ERR?` after every mode switch to verify that it successfully switched. If the mode's required licenses were not successfully checked out, the instrument will post the error:

```
-310,"System error; feature not licensed"
```

There is also a potential performance issue when using network licenses because the instrument must communicate with the server on each license check-out and check-in. This operation is usually fast (a few milliseconds), but it depends on the network communication lag between the instrument and server. For remote servers on slow or congested networks, this could be significantly slower than that.

4.10.4.2 Instrument Software Options

Instrument software licenses are those that are reported via `*OPT?` the same as HW options. For example, N9040RT1B-1NP is an instrument software option and will be reported via `*OPT?` as `RT1`. Note that the license is composed of the model number (in this case `SP900S`) combined with the option code (`RT1`).

When instrument software options are available from a network server, the instrument automatically checks them out at start-up, and only checks them in when shutting down.

4.10.4.3 License Checked Out Query (Remote Only)

Shows whether the specified license is checked out from a server. Since network served licenses may not always be available when there are limited licenses available compared to the desired number of users, the features available on an instrument can vary. Use this command to see whether the feature is currently checked-out to the instrument. The return is boolean (0 or 1), returning 1 if the

feature exists and is checked out from a server. Note that querying a license that is local to the instrument (-xFP or -xTP) also returns 0, even though the license exists and is valid, because it does not require a check-out. Also, querying a license that does not exist returns 0.

Remote Command	<code>:SYSTem:LKEY:COU? <feature></code>
Example	<code>:SYST:LKEY:COU? "N9080EM0E"</code> 1
Notes	<"OptionInfo"> contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one Return Value: 0 if not checked out, 1 if checked out

4.10.4.4 List Licenses Checked Out (Remote Command Only)

Lists the licenses checked out from a server. Since network served licenses may not always be available when there are limited licenses available compared to the desired number of users, the features available on an instrument can vary. Use this command to see which features are currently checked-out to the instrument.

Remote Command	<code>:SYSTem:LKEY:COU:LIST?</code>
Example	<code>:SYST:LKEY:COU:LIST?</code> #284 N9073EM0E,2018.0831 N9077EM0E,2018.0831 N9080EM0E,2018.0831 N9081EM0E,2018.0831

4.10.4.5 Borrowed Network Licenses

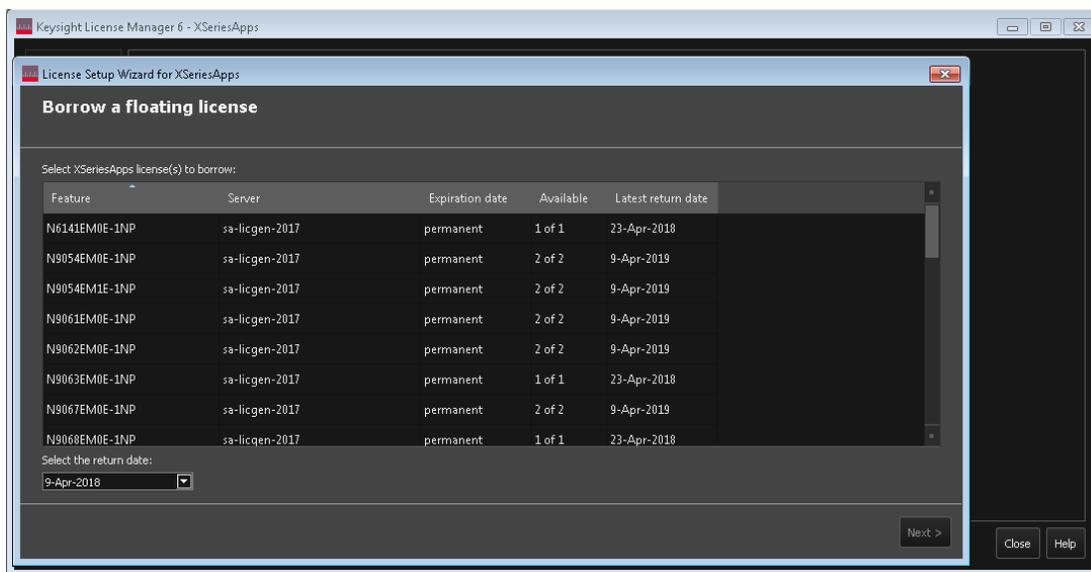

Network licenses can be borrowed from the network license server for a time. The maximum amount of time a license can be borrowed is specified in the license installed on the server and is set at the time the license is generated by Keysight. As part of the borrow operation, the user specifies how long to borrow the license. This borrow period is in hours and can be any time up to the maximum allowed by the license. Once borrowed, the license will appear as a local license and can be used even when not connected to the network, and the instrument software will treat them the same as other time-based licenses that are installed on the instrument. This means the licenses are validated when the instrument is started and then are used without the overhead of checking them out and back in when switching modes. At the time of the borrow, a time is specified for how long the license will be borrowed. When that time expires, the license is automatically returned to the

network license server even if the instrument is not connected to the network. If the user is done with the license before it automatically returns to the network server, the license can be explicitly returned earlier.

4.10.4.6 Borrow a License

Licenses are borrowed by using the Keysight License Manager 6 application. This can be launched from the **System Licensing** screen.

Graphic

The corresponding remote command is:

Remote Command	<code>:SYSTEM:LKEY:BORRow "<feature>[,<version>]",<return date> :SYSTEM:LKEY:BORRow? "<feature>[,<version>]"</code>
Example	<code>:SYST:LKEY:BORR "N9080EM0E", "20-Aug-2018" :SYST:LKEY:BORR? "N9080EM0E" "20-Aug-2018"</code>
Notes	If <code><version></code> is not specified, the highest available version will be borrowed The <code><return date></code> is the day when the borrow will automatically be returned to the server
Dependencies	For the command, when <code><feature></code> is not a valid license, or when a license is not currently available for borrowing, one of the following errors is issued: <ul style="list-style-type: none"> -224, "IllegalParameterValue;License is not installed" -224, "IllegalParameterValue;Unknown license feature"

-
- -224, "IllegalParameterValue;License not available for borrowing"

Additionally, the return date will be evaluated. If it is not a valid date, the following error is issued:

- -224, "IllegalParameterValue;Invalid return date"
- -200, "Execution error; No Available Borrow Licenses For Feature: <feature>"

The return date may be clipped to the maximum borrow allowed by the license. When this happens, the following warning is issued:

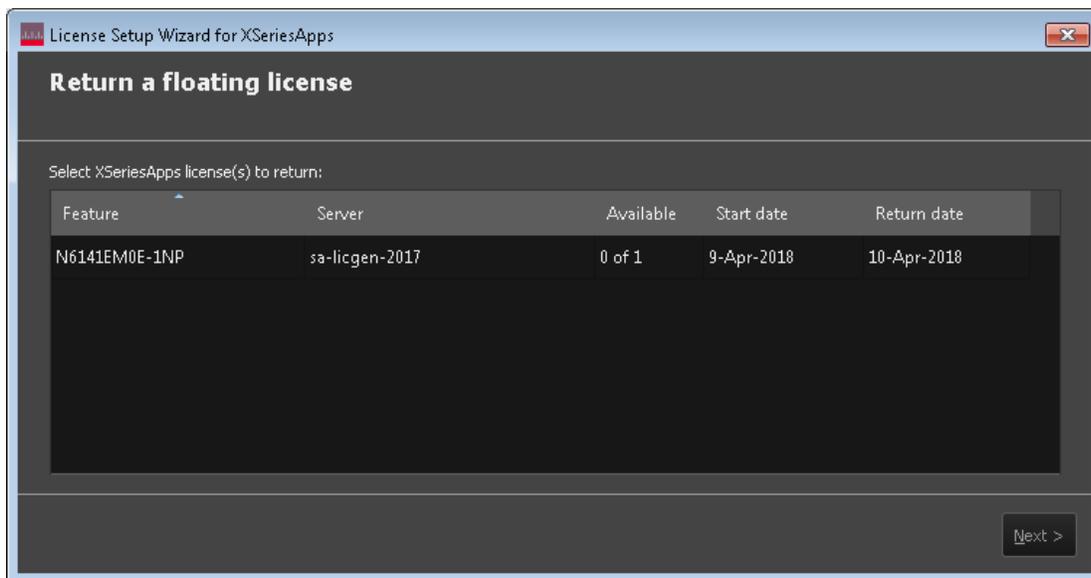

- -221, "Return date clipped to maximum of <max date>"

For the query, the return is the borrow return date (as a string in **dd-mmm-yyyy** format) if the license is borrowed. In all other cases, (not borrowed, not installed, etc.) the return is an empty string

4.10.4.7 Listing Borrowed Licenses and Return a Borrowed License

The Keysight License Manager 6 can also be used to see the currently borrowed licenses or return a license before the automatic return time.

Graphic

List Borrowed Licenses (Remote Command Only)

Remote Command : **SYSTEM:LKEY:BORROW:LIST?**

Example `:SYST:LKEY:BORR:LIST?`
 #266
 N9073EM0E,2018.0831,20-Aug-2018
 N9077EM0E,2018.0831,20-Aug-2018

Return a Borrowed License (Remote Command Only)

Remote Command `:SYSTem:LKEY:BORRow:RETurn "<feature>"`

Example `:SYST:LKEY:BORR:RET "N9080EM0E"`

Dependencies When `<feature>` is not a valid license or when a license is not borrowed, one of the following errors is issued:

- -224, "IllegalParameterValue;License is not installed"
- -224, "IllegalParameterValue;Unknown license feature"
- -224, "IllegalParameterValue;License not borrowed"

4.10.4.8 Enabling Network Checkouts While Borrowed

The default for borrowed license use is that the user will be explicitly borrowing all desired network licenses, and that all other available network licenses should be ignored. This allows the user to intentionally limit the functionality available to the instrument to what is explicitly borrowed.

For example, the RT1/RT2 options that enable the RTSA mode are automatically checked out when the instrument is started because the hardware must be configured for them at startup time. If the user does not intend to use RTSA, then by borrowing only the licenses they want to use and disabling other network checkouts, the RT1/RT2 licenses will not be checked out at startup. This leave more RTSA licenses available for others to use. Note that the instrument must be restarted after the borrowing has been done to ensure the release of any network licenses already acquired.

If the user's intent in borrowing is to ensure access to a particular feature or application, but still wants to opportunistically use other features or applications, the default behavior can be changed to enable network license checkouts even when licenses have been borrowed.

Remote Command `:SYSTem:LKEY:BORRow:NETWork:COU:ENABle`

Example `:SYST:LKEY:BORR:NETW:COU:ENAB 0`
 `:SYST:LKEY:BORR:NETW:COU:ENAB?`

Dependencies Control is only visible when licensing is configured to use a network server. SCPI is always available

Preset This is unaffected by **Preset** but is set to 0 on **Restore Misc Defaults** or **Restore System Defaults->All**

4.10.5 USB Portable Licenses

The USB Portable license is implemented with a physical dongle that is a USB device, like a USB thumb drive. It has a Host ID fixed in the dongle HW. It does not contain any writable data and so is acceptable to high security A/D customers. Transporting licenses from one instrument to another just requires moving the dongle and license files to the desired instrument. The license files can be installed on many instruments, but they will only be valid the one instrument that has the dongle. The use of USB portable licenses requires that the Keysight Floating License Manager is installed on the instrument. The licenses can then be added to the instrument's server.

USB Portable licenses are checked out and in like Network licenses. Because the licenses are local, there will be no network latency involved in the check-out/check-in, but there can still be a slight performance degradation compared to Fixed and Transportable licenses. If the instrument allows multiple concurrent instances of the X-Series software (as is the case for modular products), there may also be availability issues if all licenses are already checked out to other X-Series instances. Plugging/un-plugging the dongle is equivalent to transporting a license to/from the instrument, however, the software must be restarted whenever the dongle is plugged in.

4.10.6 Configuring Network and USB Portable Licenses

The Keysight Floating License Manager must be used to configure the Network or USB Portable licenses before the licenses can be used. Currently, an instrument can only be configured for Network or USB Portable licenses or both.

- To set up USB Portable licenses, in the Keysight Floating License Manager select “Start a floating license server with a license file” and add files containing the USB Portable licenses desired.
- To set up Network licenses, in the Keysight Floating License Manager select “Connect to a floating license server” and enter the network server's name preceded by the “@” character (example: “@myserver”).
- To set up both Network and USB Portable license, first configure the USB Portable license, then configure the Network licenses, but append “;@localhost” to the server name (example: “@myserver;@localhost”). Whenever the configuration is changed, the X-Series software must be restarted.

4.10.7 Floating License Manager

Pressing **Floating License Manager** opens the License Explorer for Network and USB Portable licenses.

NOTE

This feature is not available if option SF1 is installed.

For help on licensing, select **Help** in the menu bar at the top of the License Explorer window.

4.10.8 Install License (Remote Command Only)

Used to add a license to the instrument.

An example of such a command would be as below. The parameter is a unique 120-character code for each license.

```
SYST:LKEY "N9073A-1FP", "027253AD27F83CDA5673A9BA5F427FDA5E4F25AEB1017638211AC9F60D9C639FE539735909C551DE0A91"
```

Another example using one of the optional clauses.

```
SYST:LKEY "N9063EM0E-1FP, 2019.0330", "02220210867E187713C9AFD4C90EA0DE2B674615DD0255798EE5B237A146A0D4E411E0ABFE04D3CAFDFA", "ISSUED=30-Mar-2018"
```

NOTE

This command will not work for Transportable, Network or USB Portable licenses.

Remote Command	:SYSTem:LKEY <"OptionInfo">, <"LicenseInfo">, <"Optional1">, <"Optional2">, <"Optional3">, <"Optional4">, <"Optional5">
----------------	---

Notes	<"OptionInfo"> contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one, since the system knows which version is supported for each feature <"LicenseInfo"> contains the signature, the expiration date, and serial number for transport if transportable. You must specify the signature, but you can omit the other information. If you omit the expiration date, the system regards it as permanent. If you omit the serial number, the system regards it as non-transportable. As a result, this supports reverse compatibility <"Optional#"> are optional parameters that may be needed to match the information in the original license
-------	--

4.10.9 Remove License (Remote Command Only)

Removes a particular license.

4 System
4.10 Licensing

An example of such a command would be as below. The parameter is a unique 120-character code for each license.

```
SYST:LKEY:DEL "N9073A-1FP", "027253AD27F83CDA5673A9BA5F427FDA5E4F25AEB1017638211AC9F60D9C639FE539735909C551DE0A91"
```

NOTE

This command will not work for Transportable, Network or USB Portable licenses.

Remote Command	<code>:SYSTem:LKEY:DELeTe <"OptionInfo">,<"LicenseInfo"></code>
Notes	<p><"OptionInfo"> contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one, if more than one version is installed</p> <p><"LicenseInfo"> contains the signature, the expiration date, and whether be transportable. You must specify the signature, but you can omit the other information. If you omit the expiration date, the system regards it as permanent. If you omit the transportability, the system regards it as non-transportable. As a result, this supports reverse compatibility</p>

4.10.10 List Licenses (Remote Command Only)

Returns a list of installed licenses.

Remote Command	<code>:SYSTem:LKEY:LIST?</code>
Notes	<p>Return Value:</p> <p>An <arbitrary block data> of all the installed instrument licenses</p> <p>The format of each license is as follows</p> <p><Feature>,<Version>,<Signature>,<Expiration Date>,<Serial Number for Transport>,...</p> <p>Return Value Example:</p> <pre>#3136 N9073A-1FP,1.000,B043920A51CA N9060A-2FP,1.000,4D1D1164BE64 N9020A-508,1.000,389BC042F920 N9073A-1F1,1.000,5D71E9BA814C,13-aug-2005</pre> <p><arbitrary block data> is:</p> <p>#NMMM<data></p> <p>Where:</p> <p>N is the number of digits that describes the number of MMM characters. For example, if the data was 55 bytes, N would be 2</p> <p>MMM would be the ASCII representation of the number of bytes. In the previous example, N would be 55</p>

<data> ASCII contents of the data

Additional fields may appear depending on the type of license (Fixed, Transportable, Network, USB Portable)

4.10.11 Validate License (Remote Command Only)

Allows you to query whether a particular license is currently valid.

Remote Command :SYSTem:LKEY? <"OptionInfo">

Example :SYST:LKEY? "N9073A-1FP"

Notes <"OptionInfo"> contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one

Return Value:

<"LicenseInfo"> if the license is valid, null otherwise

<"LicenseInfo"> contains the signature, the expiration date, and serial number if transportable

Return Value Example:

"B043920A51CA"

4.10.12 Host ID Query (Remote Command Only)

Returns the Host ID as a string.

Remote Command :SYSTem:HID?

4.11 Service

Accesses capabilities performed in the factory or under instructions from repair procedures. This key is only visible when the logged-in user is “[advanceduser](#)” or “[saservice](#)”. The first access to the **Service** menu after invoking the instrument application will require an authentication Service Code.

Dependencies	Not available in UXM
--------------	----------------------

4.12 SCPI Recorder

Allows you to view active recording content, and edit the content. Right-click or touch and hold on any UI control to display a menu allowing you to record the SCPI associated with the control.

Selecting this tab displays the **Recorder** dialog on the right. The dialog displays the recorder table with the data in chronological order of recording. The Function Label column shows the feature name, for example, Center Frequency, and the SCPI column shows the full mnemonic corresponding to the feature.

4.12.1 Continuous SCPI Recording

This toggle control sets the state of continuous recording.

When enabled (**ON**), *all* user interaction with settings that are Immediate Actions, and that have associated SCPI commands or queries, are added as recording entries in chronological order. Not every User Interface action has a corresponding SCPI command/query, for example, navigation actions between dialogs and menus in the User Interface do not have corresponding SCPI commands. All settings or a measurement that are accessible via menus have SCPI commands, so modifying those settings will create entries in the Recorder.

NOTE

When recording is turned on, some entries are automatically created and added to the recording. These are: `:INST:CONF:<mode>:<meas>` (see "**Mode**" on page 112) and `*OPC?` (see "***OPC? - Operation Complete**" on page 3408). These commands set the current Mode and Measurement, perform a **Mode Preset**, then cause the instrument to wait for the completion of any previous commands. When **Continuous SCPI Recording** fills the recording container to the limit, a warning message is displayed to notify you that the recording container is full and recording will be stopped, unless the recording limit is increased.

NOTE

To maintain the integrity of recording, stop recording *before* sending remote commands to the instrument. Changes made to the instrument via remote SCPI are *not* recorded.

4.12.2 Recording Limit

When "**Continuous SCPI Recording**" on page 2825 is enabled, every change you make is recorded into the recording system, which can lead to extremely large recordings.

This value limits how much content can be saved into the recording table. You may change this number to suit your needs, but the value cannot be less than 0 or greater than 500. When the recording length reaches the limit, a warning is displayed to indicate that the recording size has reached the limit and recording will be stopped.

The default limit is 250. If the limit is reduced after recording entries are added, the reduced count cannot be less than the current number of entries in the recording. If the newly-entered limit is smaller than the existing number of entries, then the actual new limit is set to the current number of entries. Increasing the limit will increase memory consumption.

4.12.3 Copy

Copies the SCPI column data to the system Clipboard, to make it available for Paste operations.

4.12.4 Insert *OPC?

Certain queries and commands must be sent during instrument programming, but there is no corresponding user-interface control for these commands. This control allows you to insert one such query; ***OPC?**.

4.12.5 Delete Row

Deletes the selected entry from the recording table. Note that some entries may have subsequent entries related to the row that you delete, for example, ***OPC?**, which may be added automatically after a mode or measurement switch.

4.12.6 Delete All

Deletes all entries from the recording table. A warning message is displayed: "All recording data will be deleted".

To confirm that you want to delete the entire recording content, click **OK**, or click **Cancel** to avoid deleting it.

4.12.7 Move Up

Moves the selected / highlighted row up by 1 slot. Note that moving a mode or measurement switch entry in the table may impact context for subsequent entries in the table.

4.12.8 Move Down

Moves the selected / highlighted row down by 1 slot. Note that moving a mode or measurement switch entry in the table may impact context for subsequent entries in the table.

4.12.9 Play

Clicking this control causes each of the entries in the SCPI Recorder table to be executed.

If execution results in any errors, then a message box showing the SCPI command and its corresponding error are displayed after play has completed.

4.13 System Remote Commands (Remote Commands Only)

These commands have no front-panel key equivalent.

- "List installed Options (Remote Command Only)" on page 2828
- "Lock the Front-panel keys (Remote Command Only)" on page 2828
- "Lock Workstation (Remote Command Only)" on page 2829
- "List SCPI Commands (Remote Command Only)" on page 2831
- "Front Panel activity history (Remote Command only)" on page 2831
- "SCPI activity history (Remote Command only)" on page 2832
- "Instrument start time (Remote Query only)" on page 2832
- "SCPI Version Query (Remote Query Only)" on page 2833
- "Date (Remote Command Only)" on page 2833
- "Time (Remote Command Only)" on page 2833
- "Input Overload Enable (Remote Command Only)" on page 2834
- "Power Up (Remote Query Only)" on page 2834

4.13.1 List installed Options (Remote Command Only)

Lists the installed options that pertain to the instrument (signal analyzer).

Remote Command	<code>:SYSTem:OPTions?</code>
Example	<code>:SYST:OPT?</code>
Notes	The return string is a comma-separated list of the installed options. For example: <code>"503,P03,PFR"</code> <code>:SYSTem:OPTions?</code> and <code>*OPT?</code> are the same
State Saved	No

4.13.2 Lock the Front-panel keys (Remote Command Only)

Disables the instrument keyboard to prevent local input when the instrument is controlled remotely. Annunciation showing a "K" for 'Klock' (keyboard lock) alerts

the local user that the keyboard is locked. Klock is similar to the GPIB Local Lockout function; namely that no front-panel keys are active except for the Power Standby key. (The instrument is allowed to be turned-off if Klock is **ON**.) The Klock command is used in remote control situations where Local Lockout cannot be used.

Although primary intent of Klock is to lock-out the front panel, it will lock-out externally connected keyboards through USB. Klock has no effect on externally connected pointing devices (mice).

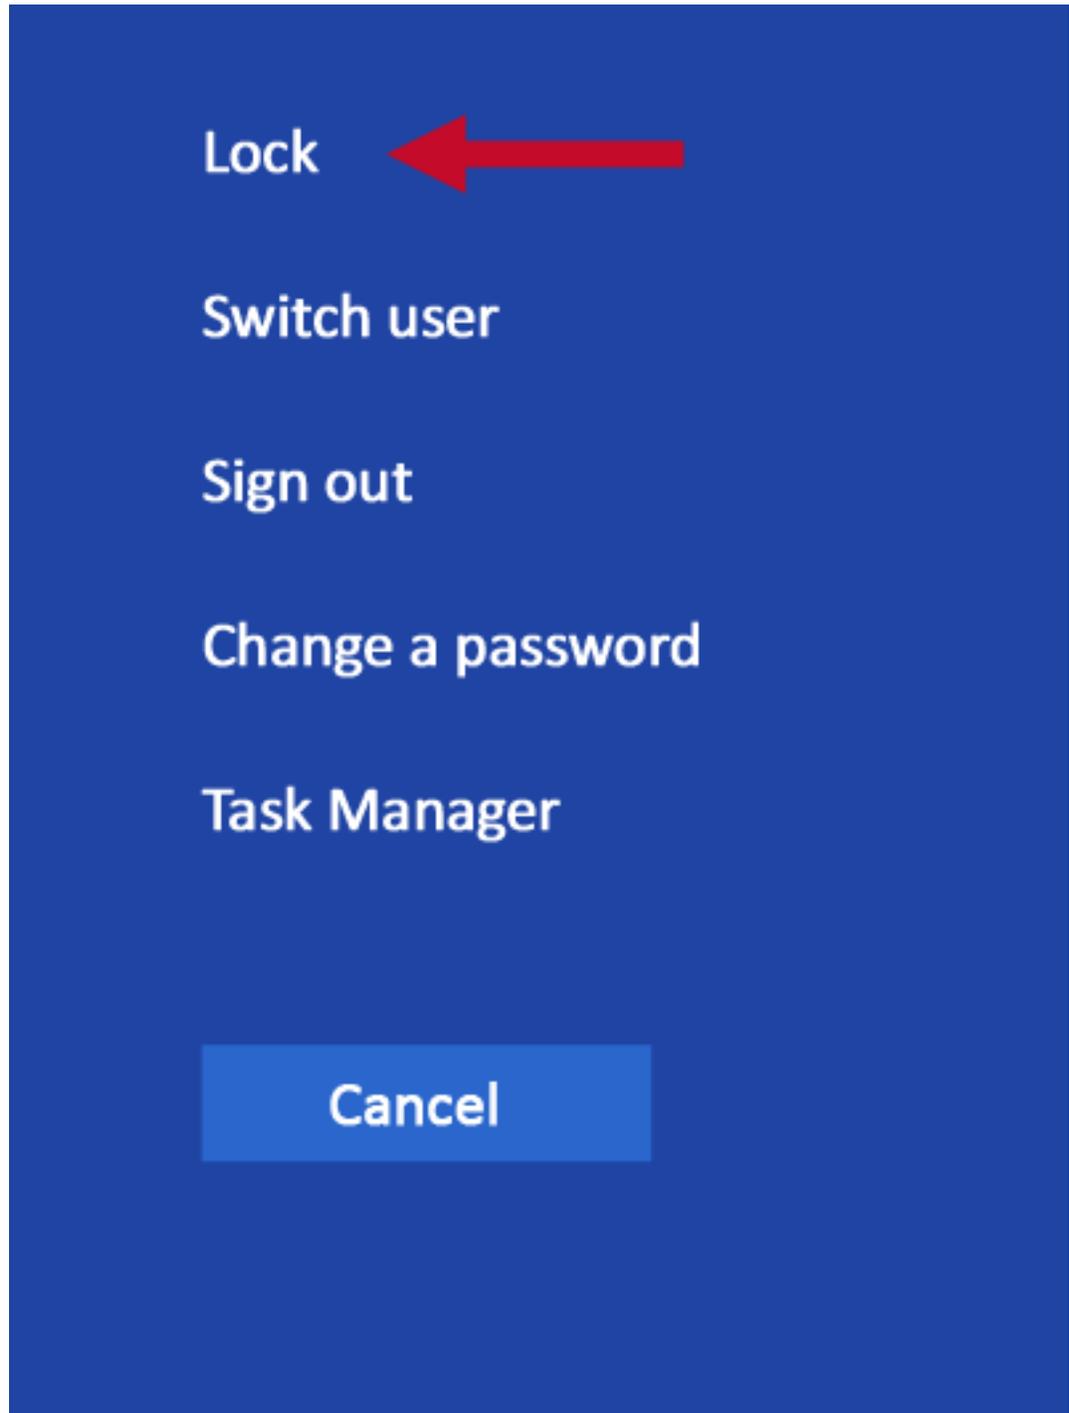

The front panel '**Local**' key (**Cancel/Esc**) has no effect if Klock is **ON**.

See also "[Local Button](#)" on page 204.

Remote Command	<code>:SYSTem:KLOCK OFF ON 0 1</code> <code>:SYSTem:KLOCK?</code>
Example	<code>:SYST:KLOC ON</code>
Notes	Keyboard lock remains in effect until turned-off, or until the instrument is power-cycled
Preset	Initialized to OFF at startup, unaffected by Preset
State Saved	No

4.13.3 Lock Workstation (Remote Command Only)

Performs the same functionality as the **Win+L** function or the "Lock" function on the **CTL-ALT-DEL** screen in Windows.

As soon as you do this, the computer is locked. The initial login screen appears; no one can access the computer at that point unless they have an account and know the account's password.

Failure to initiate adds an error to the Windows event log for SA;

"LockWorkStation - Failed to initiate function"

See also "Local Button" on page 204.

Remote Command	:SYSTem:LWStation
Example	:SYST:LWST
Notes	The lock remains in effect until a user logs in
State Saved	No

4.13.4 List SCPI Commands (Remote Command Only)

Outputs a list of the valid SCPI commands for the currently selected Mode.

Remote Command	:SYSTem:HELP:HEADers?
Example	:SYST:HELP:HEAD?
Notes	The output is an IEEE Block format with each command separated with the New-Line character (0x0A)

4.13.5 Front Panel activity history (Remote Command only)

Instrument front panel usage can be monitored using :SYSTem:METRics:FPANel?. The monitoring occurs for front panel hardkey or softkey operation (including mouse or touch operation on instruments with Multi-Touch User Interface). The information of the usage pertains to the activity since the instrument application was started; the information does not persist after the application is terminated, or the instrument has been rebooted.

To prevent the front panel from being placed into Remote the monitoring must occur via an I/O protocol such as LAN Socket, or the remote program performing the monitoring must explicitly place the instrument into Local after the query has been performed.

Remote Command	:SYSTem:METRics:FPANel?
Example	:SYST:METR:FPAN?
Notes	<p>The return value is a string with the format "YYYY-MM-DD<space>HH:MM:SS", in instrument local time</p> <p>If no front panel activity has occurred since the instrument was booted (instrument application started), the return value will be the time the instrument application started. The instrument application start time can be obtained with the query :SYSTem:METRics:STIME?</p>

4.13.6 SCPI activity history (Remote Command only)

Instrument remote operation usage via SCPI can be monitored using `:SYSTem:METRics:SCPI?`. The monitoring occurs for SCPI control from any I/O channel (GPIB, USB, or LAN). The information of the usage pertains to the activity since the instrument application was started; the information does not persist after the application is terminated, or the instrument has been rebooted.

Remote Command	<code>:SYSTem:METRics:SCPI?</code>
Example	<code>:SYST:METR:SCPI?</code>
Notes	<p>The return value is a string with the format “YYYY-MM-DD<space>HH:MM:SS”, in instrument local time</p> <p>The following commands are excluded from the history accounting:</p> <ul style="list-style-type: none"> - <code>*IDN?</code> - <code>*OPT?</code> - <code>:SYSTem:DATE?</code> - <code>:SYSTem:TIME?</code> - <code>:SYSTem:PON:TIME?</code> - Queries in the <code>:SYSTem:ERRor</code> subsystem - Queries in the <code>:SYSTem:LKEY</code> subsystem - Queries in the <code>:SYSTem:METRics</code> subsystem - Queries in the <code>:SYSTem:MODu1e</code> subsystem <p>If no SCPI activity has occurred since the instrument was booted (instrument application started), the return value will be the time the instrument application started. The instrument application start time can be obtained with the query <code>:SYSTem:METRics:STIME?</code></p>

4.13.7 Instrument start time (Remote Query only)

To determine if instrument activity has occurred, `:SYSTem:METRics:STIME?` can be used to determine the instrument application start time.

Remote Command	<code>:SYSTem:METRics:STIME?</code>
Example	<code>:SYST:METR:STIM?</code>
Notes	<p>The return value is a string with the format “YYYY-MM-DD<space>HH:MM:SS”, in instrument local time</p>

4.13.8 SCPI Version Query (Remote Query Only)

Returns the SCPI version number with which the instrument complies. The SCPI industry standard changes regularly. This command indicates the version used when the instrument SCPI commands were defined.

Remote Command	:SYSTem:VERsion?
Example	:SYST:VERS?

4.13.9 Date (Remote Command Only)

The recommended access to the Date, Time, and Time zone of the instrument is through the Windows native control (Control Panel or accessing the Task Bar). You may also access this information remotely, as shown in here and in "[Time \(Remote Command Only\)](#)" on page 2833.

Sets or queries the date in the instrument.

Remote Command	:SYSTem:DATE "<year>,<month>,<day>" :SYSTem:DATE?
Example	:SYST:DATE "2006,05,26"
Notes	<year> is the four-digit representation of year (for example, 2006) <month> is the two-digit representation of year (01 to 12) <day> is the two-digit representation of day (01 to 28, 29, 30, or 31, depending on the month and year) Unless the current account has Power User or Administrator privileges, sending this command generates an error, and no action is taken

4.13.10 Time (Remote Command Only)

Sets or queries the time in the instrument.

Remote Command	:SYSTem:TIME "<hour>,<minute>,<second>" :SYSTem:TIME?
Example	:SYST:TIME "13,05,26"
Notes	<hour> is the two-digit representation of the hour in 24-hour format <minute> is the two-digit representation of minute <second> is the two-digit representation of second Unless the current account has Power User or Administrator privileges, sending this command generates an error, and no action is taken

4.13.11 Input Overload Enable (Remote Command Only)

Input Overload errors are reported using the Input Overload status bit (bit 12 in the Measurement Integrity Status Register). Input Overloads (for example, ADC Overload errors) can come and go with great frequency, generating many error events (for example, for signals just on the verge of overload), and so are not put into the SCPI error queue by default. Normally the status bit is the only way for detecting these errors remotely.

Use this command to enable or disable Input Overload reporting to the SCPI queue. By default, reporting is disabled. Send `:SYSTem:ERRor:OVERload ON` to enable and `:SYSTem:ERRor:OVERload OFF` to disable. In either case, Input Overloads always set the status bit.

NOTE For versions of firmware before A.10.01, the Input Overload was only a Warning and so was never available in the SCPI queue, although it did set the status bit. For A.10.01 and later, the Input Overload is an error, which can be enabled to the SCPI queue using this command.

Remote Command	<code>:SYSTem:ERRor:OVERload[:STATe] 0 1 OFF ON</code>
Example	<code>:SYST:ERR:OVER 1</code> Enable overload errors
Preset	Set to OFF by Restore Misc Defaults (no Overload errors go to SCPI)
State Saved	Saved in instrument state

4.13.12 Power Up (Remote Query Only)

Returns a list of errors encountered during the application boot-up, such as: mismatch FW-FPGA, missing Calibration data, missing hardware, and construction errors.

Remote Command	<code>:SYSTem:ERRor:PUP?</code>
Notes	If no error occurs, the return value is: "No Power Up Errors" Return Value: <code><List of error strings></code> in <code><IEEE488 Block></code> format Return Value Example: "Power up errors, see details in Windows Event Log" "Unmatched FPGA Version(s), See details in Windows Event Log"

5 Preset

The Preset functions are available in two ways; either by pressing the **Mode Preset** or **User Preset** front panel keys, or from the Preset dropdown menu that appears when you press the green Preset icon in the upper right corner of the display.

Types of Preset

The table below shows all possible presets, their corresponding SCPI commands and front-panel access methods.

Instrument settings are tiered in scope from those local to the current measurement to those global to all measurements and modes. There are presets tailored to each scope. The table identifies the scope of each preset type.

NOTE

To get a Mode back to a fully predefined state, you should execute a Restore Mode Defaults and an Input/Output Preset, but since Input/Output Preset is a global function it will affect ALL modes.

Type Of Preset	SCPI Command	Scope of Preset	Front Panel Access
Auto Couple	<code>:COUPle ALL</code>	Local to the current measurement, only affects Auto/Man variables	Meas Setup Menu
Meas Preset	<code>:CONFigure:<meas></code>	Local to the current measurement Does not preset the RF Source	Meas Setup Menu
Mode Preset	<code>:SYSTem:PRESet</code>	Local to the current mode, global to all measurements in the mode, affects most but not all parameters in the mode, does not affect Input/Output or System variables Presets the RF Source	Mode Preset (green key) and Preset Dropdown
Restore Mode Defaults	<code>:INSTrument:DEFault</code>	Local to the current mode, global to all measurements in the mode, affects all parameters in the mode but does not affect Input/Output or System variables, does not preset	Preset Dropdown

5 Preset

Type Of Preset	SCPI Command	Scope of Preset	Front Panel Access
Restore Defaults All Modes	<code>:SYSTem:DEFault MODEs</code>	the RF Source. Affects all parameters in ALL modes but does not affect Input/Output or System variables Presets the RF Source	Preset Dropdown
Restore Screen Defaults	<code>:SYSTem:DEFault SCReen</code>	Deletes all Screens but one, restores that screen to its default mode and performs a Mode Preset for that mode. Does not affect Input/Output or System variables Presets the RF Source	Preset Dropdown
User Preset	<code>:SYSTem:PRESet:USER</code>	Local to the current mode, global to all measurements in the mode, affects all parameters in the mode as well as the Input/Output variables Does not affect System variables	User Preset hardkey and Preset Dropdown
User Preset All Modes	<code>:SYSTem:PRESet:USER:ALL</code>	Same as User Preset but affects all Modes in the current Screen	Preset Dropdown
User Preset All Screens		Affects the entire Screen Configuration; global to all Modes and Screens	Preset Dropdown

Type Of Preset	SCPI Command	Scope of Preset	Front Panel Access
*RST	*RST	Same as Mode Preset - and in addition always sets Single/Cont to Single	Not available from front panel
Input/Output Preset	:SYSTem:DEFault INPut	Affects all Input/Output variables Does not preset the RF Source	Input/Output menu, Preset dropdown, and System Menu, Restore Defaults
Full Mode Preset	:SYSTem:PRESet:FULL	Same as doing Mode Preset, Restore Mode Defaults and Input/Output Preset. Essentially a factory preset of the current Mode Presets the RF Source	Preset Dropdown
Restore User Interface Defaults	:SYSTem:DEFault UINterface	Affects all variables in the "User Interface" group Does not preset the RF Source	System Menu, Restore Defaults and User Interface tabs
Restore Power On Defaults	:SYSTem:DEFault PON	Affects all variables in the "Power On" group Presets the RF Source	System Menu: Restore Defaults and Power On tabs
Restore Alignment Defaults	:SYSTem:DEFault ALIGN	Affects all variables in the "Alignments" group Presets the RF Source	System Menu, Restore Defaults and Alignments tabs
Restore Miscellaneous Defaults	:SYSTem:DEFault MISC	Affects various variables not reset by other commands Presets the RF	System Menu, Restore Defaults

5 Preset

Type Of Preset	SCPI Command	Scope of Preset	Front Panel Access
Restore All Defaults	<code>:SYSTem:DEFault [ALL]</code> <code>:SYSTem:PRESet:PERsistent</code>	Source Affects all variables Presets the RF Source	System Menu, Restore Defaults

5.1 Mode Preset

Returns the current Mode to a known state. Mode Preset only presets the current Screen, it does not affect any other Screens.

Mode Preset also presets the RF Source. In this sense it is equivalent to pressing **Source Preset** on the **Input/Output, RF Source** menu panel.

Mode Preset can be executed from the Preset dropdown or by pressing the **Mode Preset** front panel key.

5 Preset
5.1 Mode Preset

Mode Preset does the following for the currently active mode:

- Aborts the currently running measurement.
- Switches to the default measurement and brings up the default menu for that measurement.
- Sets most parameters for the Mode and all of its Measurements to a preset state.

- Clears the input and output buffers.
- Sets Status Byte to 0.

Mode Preset does not cause a Mode switch or affect any Input/Output or System settings (those set in the System Settings dialog).

Furthermore, there are some Mode settings that are unaffected by a Mode Preset (for example, Noise Floor Extensions, Limit Line data, reference marker numbers, etc.) These are only reset by Restore Mode Defaults, and in each parameter's definition table there is a note that indicates whether it is reset on a Mode Preset or on a Restore Mode Defaults.

See "[Preset](#)" on page 2835 for more information.

Remote Command	:SYSTem:PRESet
Example	:SYST:PRES
Notes	<p>*RST is preferred over :SYST:PRES for remote operation. *RST does a Mode Preset, as done by the :SYST:PRES command, and it sets the measurement mode to Single measurement rather than Continuous, for optimal remote control throughput</p> <p>See "*RST - Reset" on page 3409</p>
Status Bits/OPC dependencies	Clears all pending OPC bits. The Status Byte is set to 0
Backwards Compatibility Notes	<p>In the X-Series, the legacy "Factory Preset" has been replaced with Mode Preset, which only presets the currently active mode, not the entire instrument. In the X-Series, the way to preset the entire instrument is by using System, Restore System Defaults All, which behaves essentially the same way as restore System Defaults does on ESA and PSA</p> <p>There is also no "Preset Type" as there is on the PSA. There is a green Mode Preset front-panel key that does a Mode Preset and a white-with-green-letters User Preset front-panel key that does a User Preset. The old PRESet:TYPE command is ignored (without generating an error), and SYST:PRES without a parameter does a Mode Preset, which should cover most backward code compatibility issues</p> <p>The settings and correction data under the Input/Output front-panel key (examples: Input Z Corr, Ext Amp Gain, etc.) are no longer part of any Mode, so they will not be preset by a Mode Preset. They are preset using Restore Input/Output Defaults, Restore System Defaults All. Note that because User Preset does a Recall State, and all of these settings are saved in State, they <i>are</i> recalled when using User Preset</p>

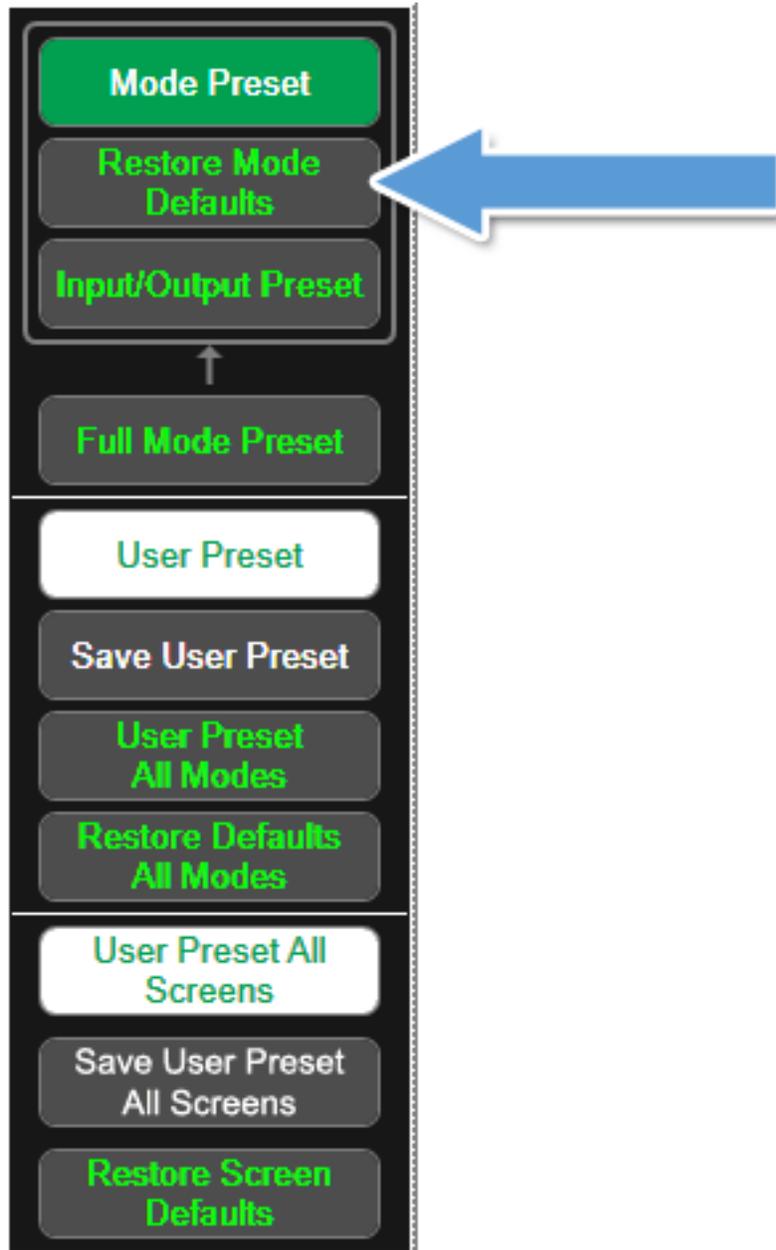

5.2 Restore Mode Defaults

Most settings within a mode are affected by Mode Preset, but there are some Mode settings that are unaffected by a Mode Preset (for example, Noise Floor Extensions, Limit Line data, reference marker numbers, etc.) **Restore Mode Defaults** resets all of these additional settings as well as all of the Mode Preset settings, *except* the RF Source.

In each parameter's definition table, there is a note that indicates whether that parameter is reset on **Mode Preset** or on **Restore Mode Defaults**.

Note that a Recall State affects all of a Mode's settings, both the Mode Preset settings and the ones additionally affected by Restore Mode Defaults.

Restore Mode Defaults can be executed from the Preset dropdown.

When **Restore Mode Defaults** is selected, a message appears saying

This will reset all of the current Mode's variables to their default state. This action cannot be undone. Do you want to proceed?

The message provides **OK** and **Cancel** buttons, to let you affirm or cancel the reset operation.

Remote Command `:INSTrument:DEFault`

5 Preset
5.2 Restore Mode Defaults

Example	<code>:INST:DEF</code>
Notes	Clears all pending OPC bits. The Status Byte is set to 0
Couplings	Restore Mode Defaults causes the currently running measurement to be aborted and causes the default measurement to be active. It gets the mode to a consistent state with all of the default couplings set

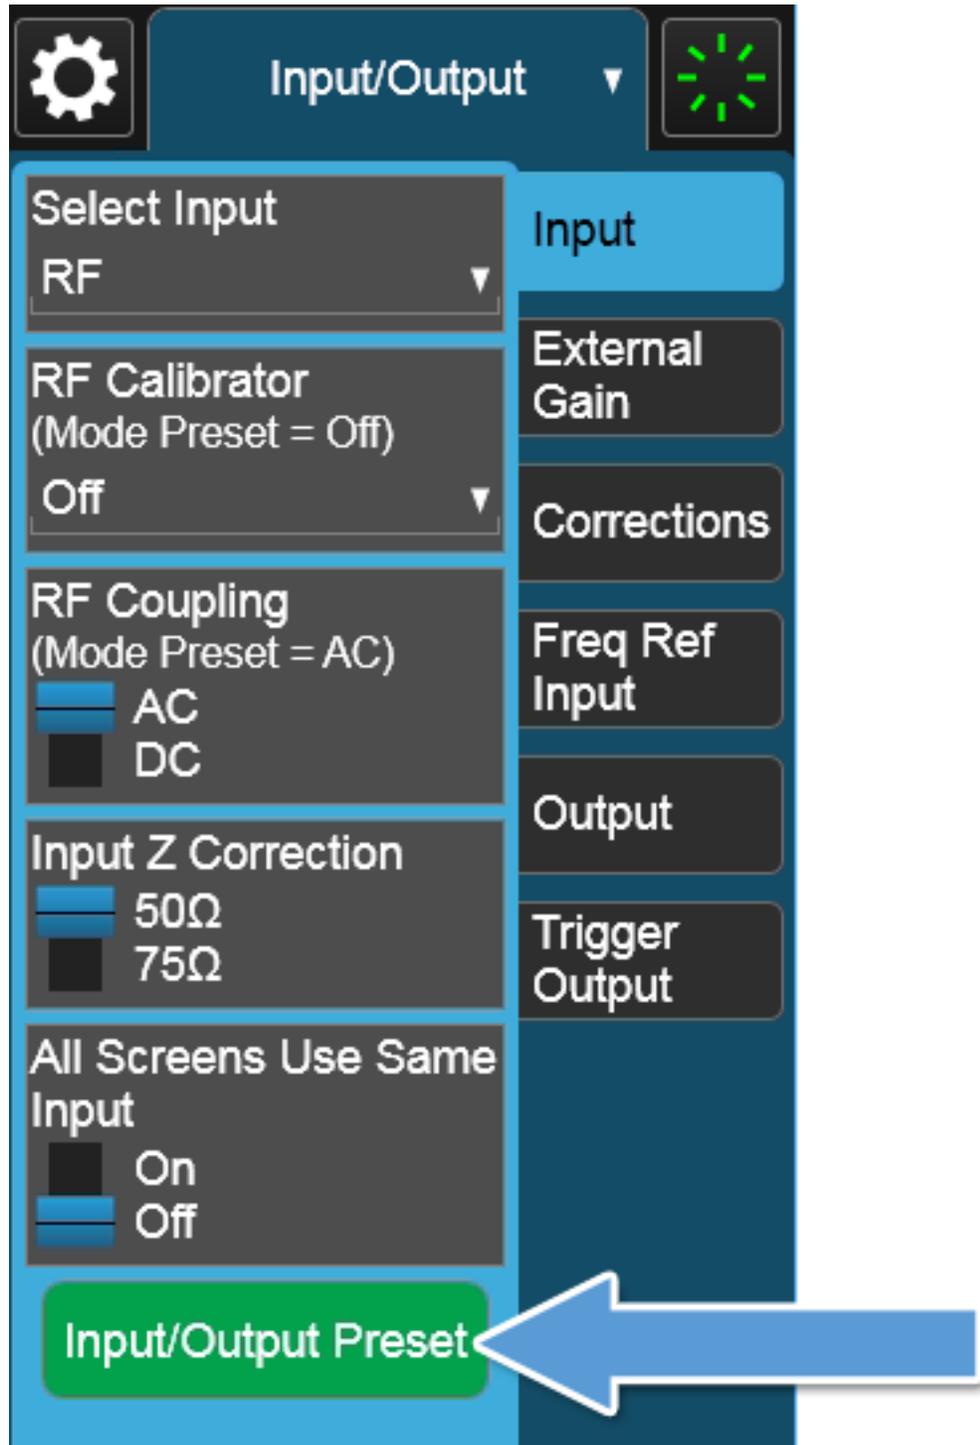

5.3 Input/Output Preset

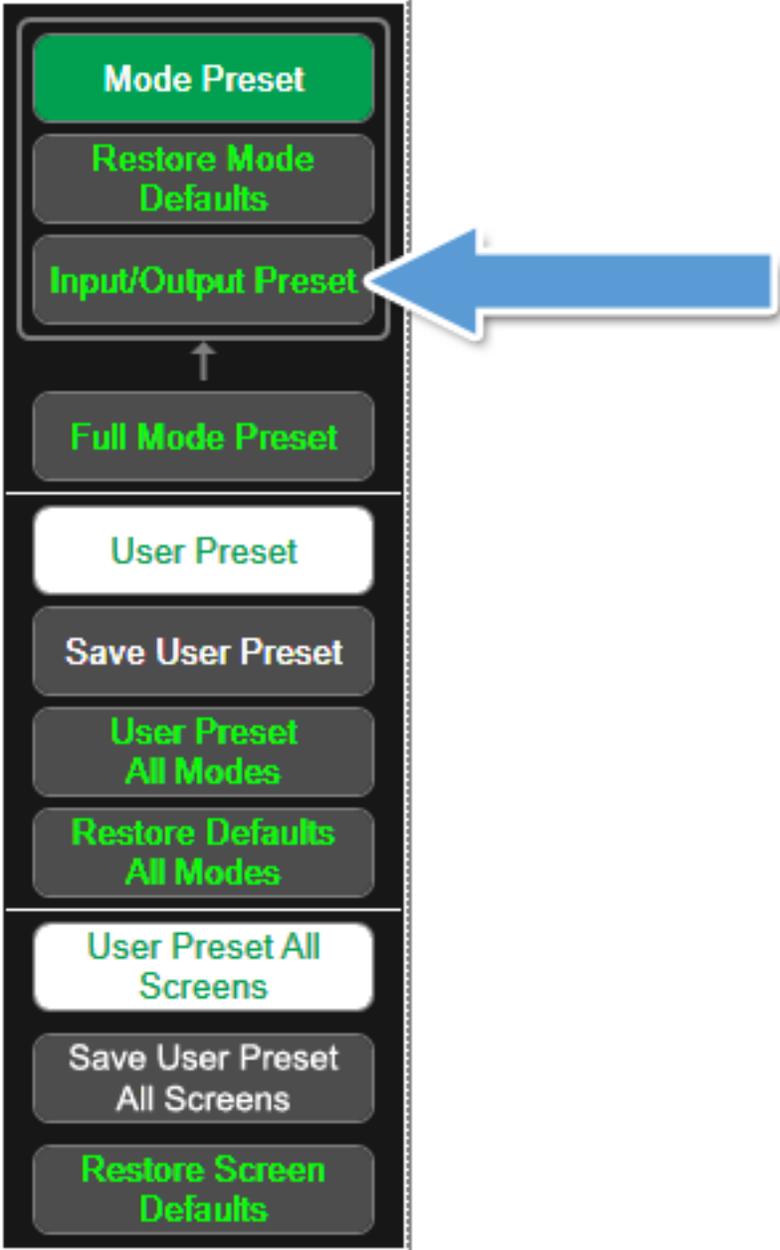

Input/Output Preset resets the group of settings and data associated with the Input/Output front-panel key to their default values. These settings are not affected by a Mode Preset because they are generally associated with connections to the instrument, and most users would not want these resetting every time they pressed the Mode Preset key.

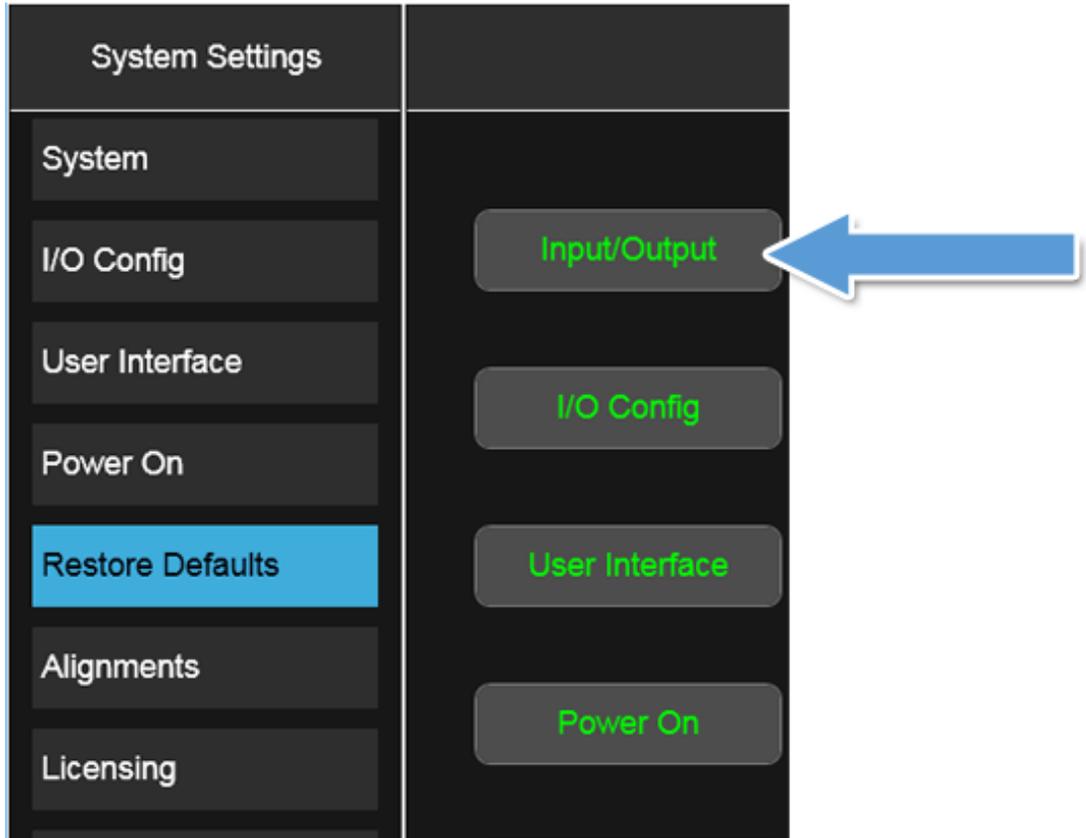

All the variables set under the Input/Output front panel key are reset by Input/Output Preset, including Amplitude Corrections and Data (described in the Corrections section), with the exception of **RF Source** settings, which are unaffected.

By using Input/Output Preset and Restore Mode Defaults, a full preset of the current mode will be performed, with the caveat that since Input/Output Preset is a global function it will affect ALL modes.

Input/Output Preset can be executed from the Input/Output menu, from the Preset dropdown, or from the Restore Defaults menu under the System key.

When Input/Output Preset is selected, a message appears saying:

“This will reset all of the Input/Output variables to their default state, including which input is selected, all Amplitude Correction settings and data, all External Mixing settings, all Frequency Reference settings and all Output settings.

It will not affect Alignment data or settings.

It will not affect RF Source settings.

This action cannot be undone. Do you want to proceed?”

The message provides **OK** and **Cancel** buttons, to let you affirm or cancel the operation.

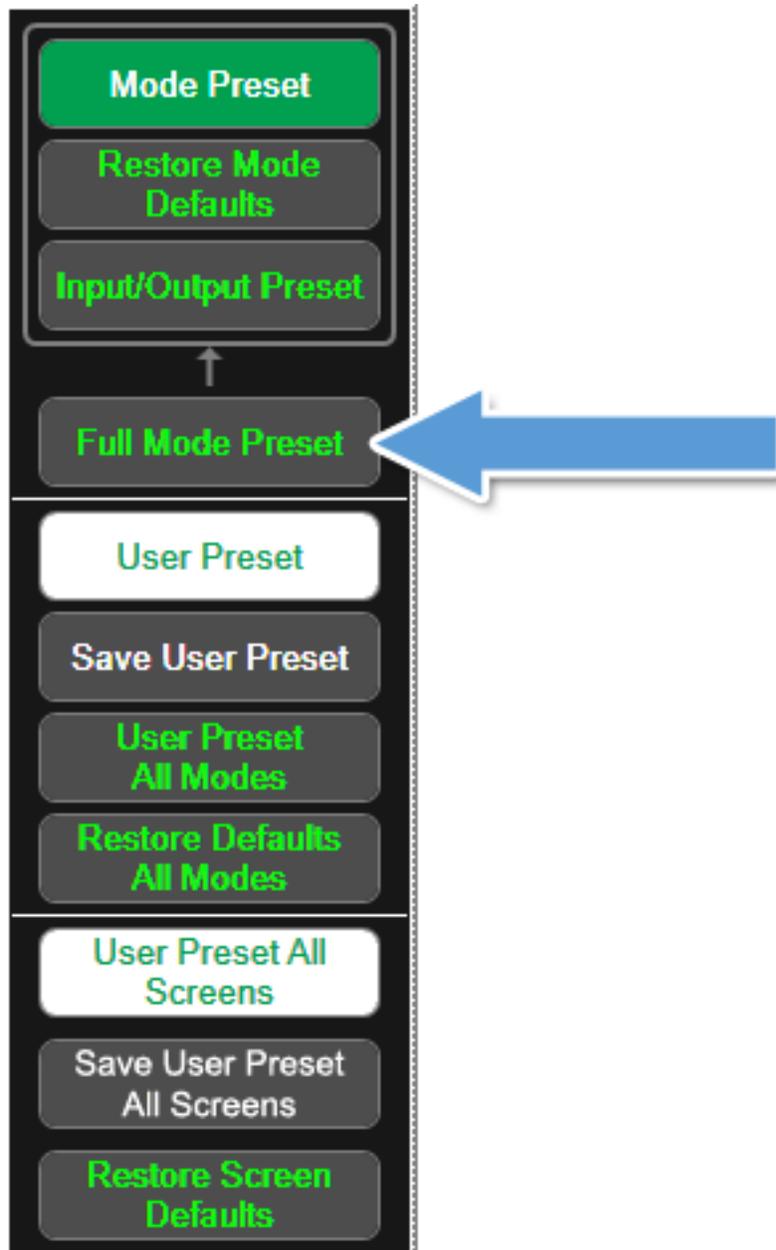

Example

`:SYST:DEF INP`

Presets all the Input/Output variables to their factory default values

5.4 Full Mode Preset

Same as doing Mode Preset, Restore Mode Defaults and Input/Output Preset. Essentially a factory preset of the current Mode.

When Full Mode Preset is selected, a message appears saying:

5 Preset
5.4 Full Mode Preset

“This will reset all of the current Mode’s variables and all of the Input/Output variables to their default state, including Input and Output selection and settings, Amplitude Correction, Frequency Reference and RF Source settings.

It will not affect Alignment data or settings.

This action cannot be undone. Do you want to proceed?”

The message provides **OK** and **Cancel** buttons, to let you affirm or cancel the operation.

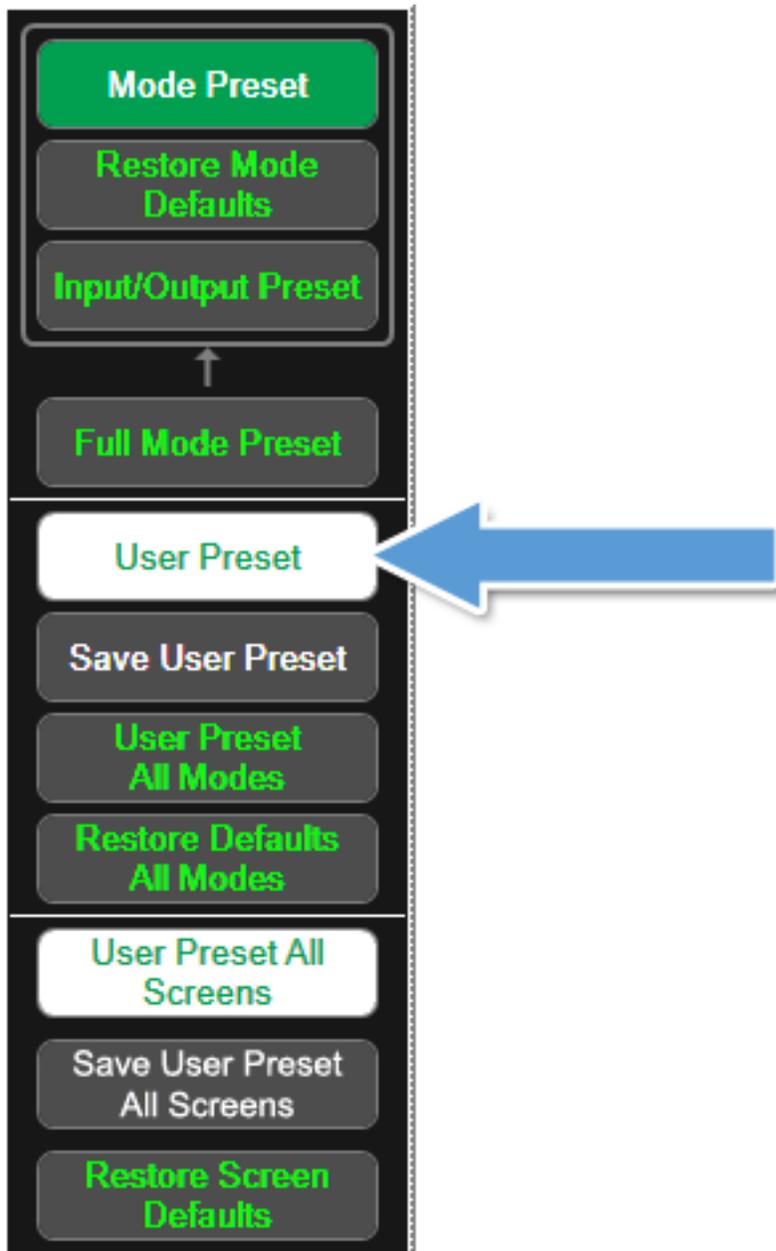

Remote Command	<code>:SYSTem:PRESet:FULL</code>
Example	<code>:SYST:PRES:FULL</code>
Status Bits/OPC dependencies	Clears all pending OPC bits. The Status Byte is set to 0

5.5 User Preset

User Preset recalls a state previously saved using the **Save User Preset** function. You can save a User Preset state for each Mode, allowing you to define your own favorite state for each Mode and recall it at the touch of a single button.

User Preset can be executed by pressing the **User Preset** front panel key or from the Preset dropdown.

Because User Preset is actually a Recall State, rather than a predefined Preset, it works a little differently than Mode Preset, in that it affects all of the variables that normally only reset on Restore Mode Defaults, and it affects the Input/Output variables, because both of these are included in State files.

A default User Preset file is provided for each Mode, which simply matches the current Mode's state after a Restore Mode Defaults and Input/Output Preset has been performed.

NOTE

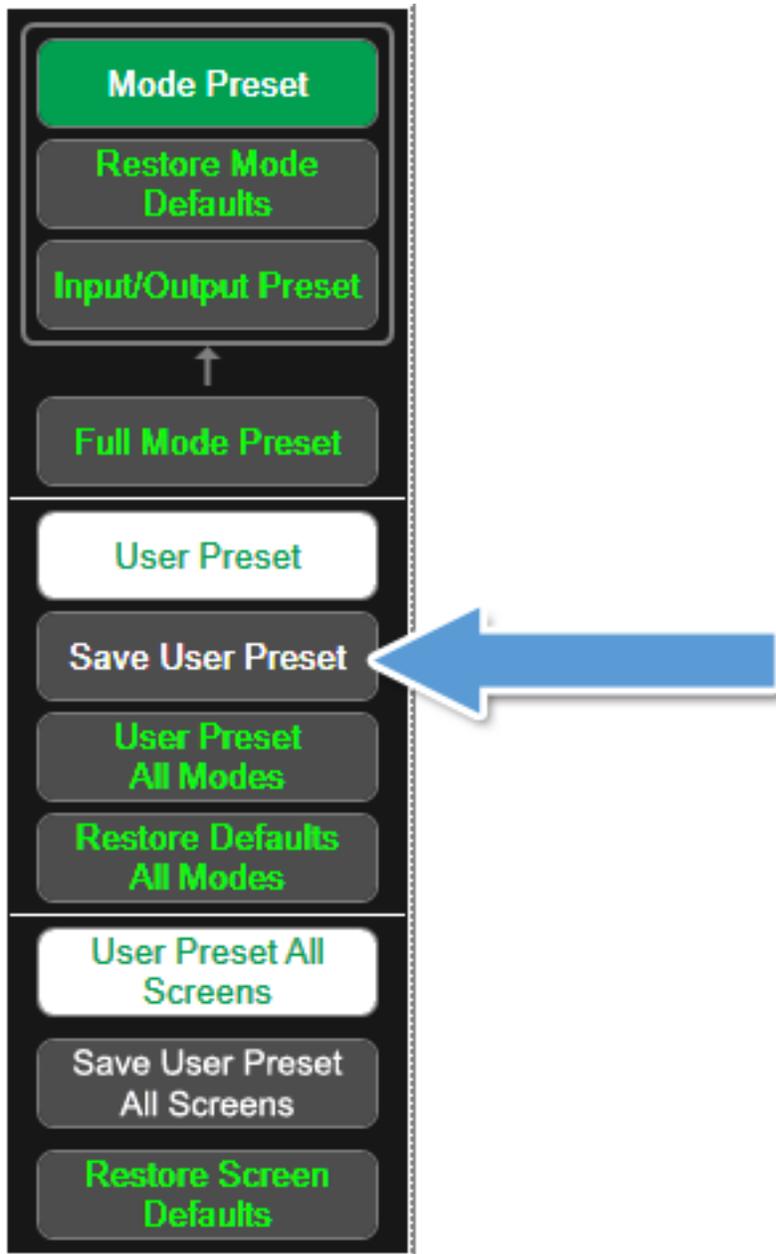

In products that run multiple instances of the X-Series Application, all instances use the same location to save User Preset state. So Save User Preset of one instance will overwrite the Save User Preset of another instance.

Remote Command	<code>:SYSTem:PRESet:USER</code>
Example	<p><code>:SYST:PRES:USER:SAVE</code></p> <p>Save the User Preset</p> <p><code>:SYST:PRES:USER</code></p> <p>Recall the User Preset</p>
Notes	<p><code>:SYST:PRES:USER:SAVE</code> is used to save the current state as the user preset state</p> <p>If loading a User Preset file from a different instrument, some settings may be limited and/or coupled differently, since the capabilities of the mode may have changed from when the User Preset file was saved</p>
Status Bits/OPC dependencies	Clears all pending OPC bits. The Status Byte is set to 0
Backwards Compatibility Notes	<p>In the X-Series A-models, the User Preset hardkey opened a menu that let you select from User Preset, Save User Preset, or User Preset All Modes. In the B-models, the User Preset hardkey immediately performs a User Preset, and the aforementioned menu is found under the Preset dropdown</p> <p>User Preset actually loads a state, and in legacy analyzers, it was possible to load a state without affecting the trace data, limit lines or correction data. Similarly it was possible to do a User Preset without affecting the trace data, limit lines or correction data</p> <p>In the X-Series, “state” always includes all of this data; so whenever state is loaded, or User Preset is executed, all of the traces, limit lines and corrections are affected. Although this differs from previous behavior, it is desirable behavior, and should not cause adverse issues for users</p> <p>On ESA and PSA, User Preset affected the entire instrument’s state. In the X-Series, User Preset only recalls the state for the active mode. There is a User Preset file for each mode. User Preset can never cause a mode switch as it can in legacy analyzers. If you want to recall all modes to their user preset file state, you will need to do a User Preset <i>after</i> mode switching into each mode</p> <p>User Preset recalls mode state, which can now include data like traces, whereas on ESA and PSA, User Preset did not affect data</p>

5.6 Save User Preset

Saves the state of the currently active mode in a unique location for recall by the User Preset key. Each Mode has one such location, so for each Mode one User Preset can be defined.

Save User Preset can be executed from the Preset dropdown.

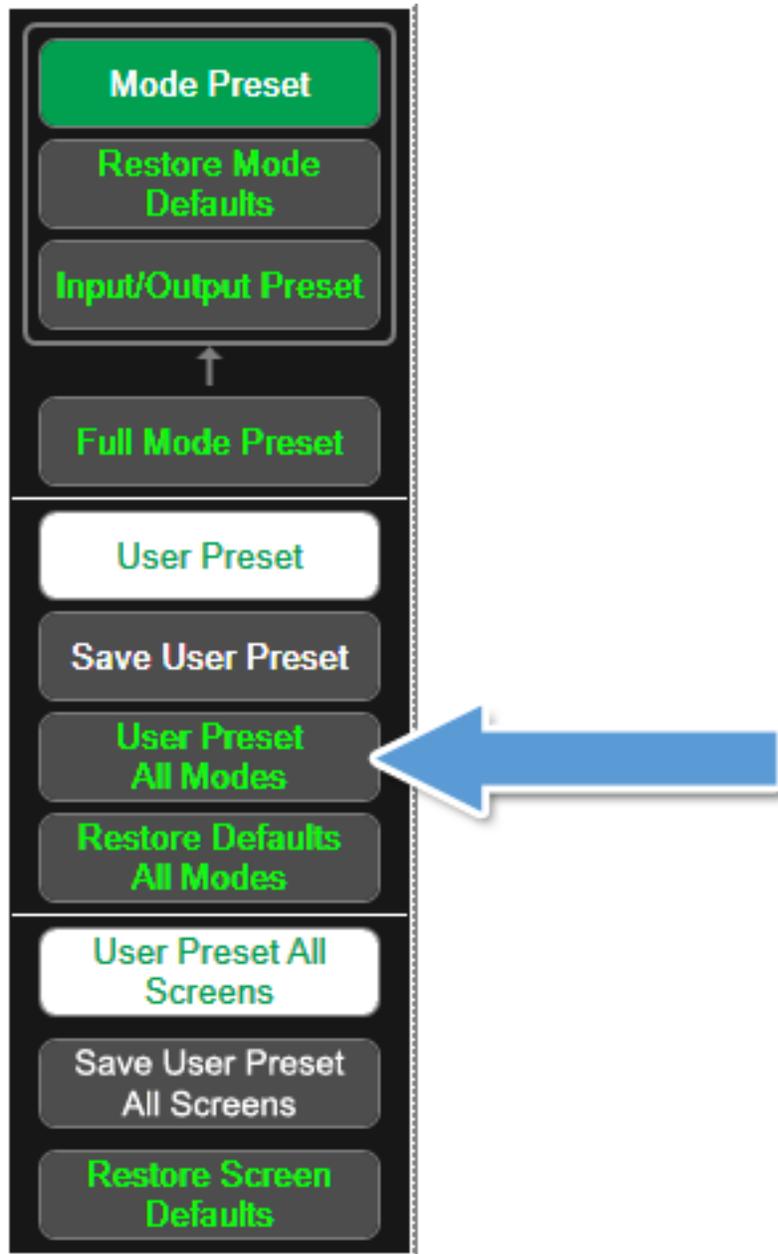

All of the Mode variables are saved, including those reset by Mode Preset and those only reset by Restore Mode Defaults, as well as all of the Input/Output variables, so when you subsequently press the **User Preset** key, the instrument returns to the exact same setup that existed when you pressed the **Save User Preset** control. Thus, User Preset is a preset of larger scope than Mode Preset.

Remote Command	<code>:SYSTem:PRESet:USER:SAVE</code>
Example	<code>:SYST:PRES:USER:SAVE</code>
Notes	<code>:SYST:PRES:SAVE</code> creates the same file as if you requested a <code>*SAV</code> or a <code>:MMEM:STOR:STAT</code> , except that User Preset Save does not allow you to specify the filename or the location of the file

5.7 User Preset All Modes

User Preset All Modes recalls all of the User Preset files for each mode, switches to the power-on mode, and activates the saved measurement from the power-on mode User Preset file.

User Preset All Modes can be executed from the Preset dropdown.

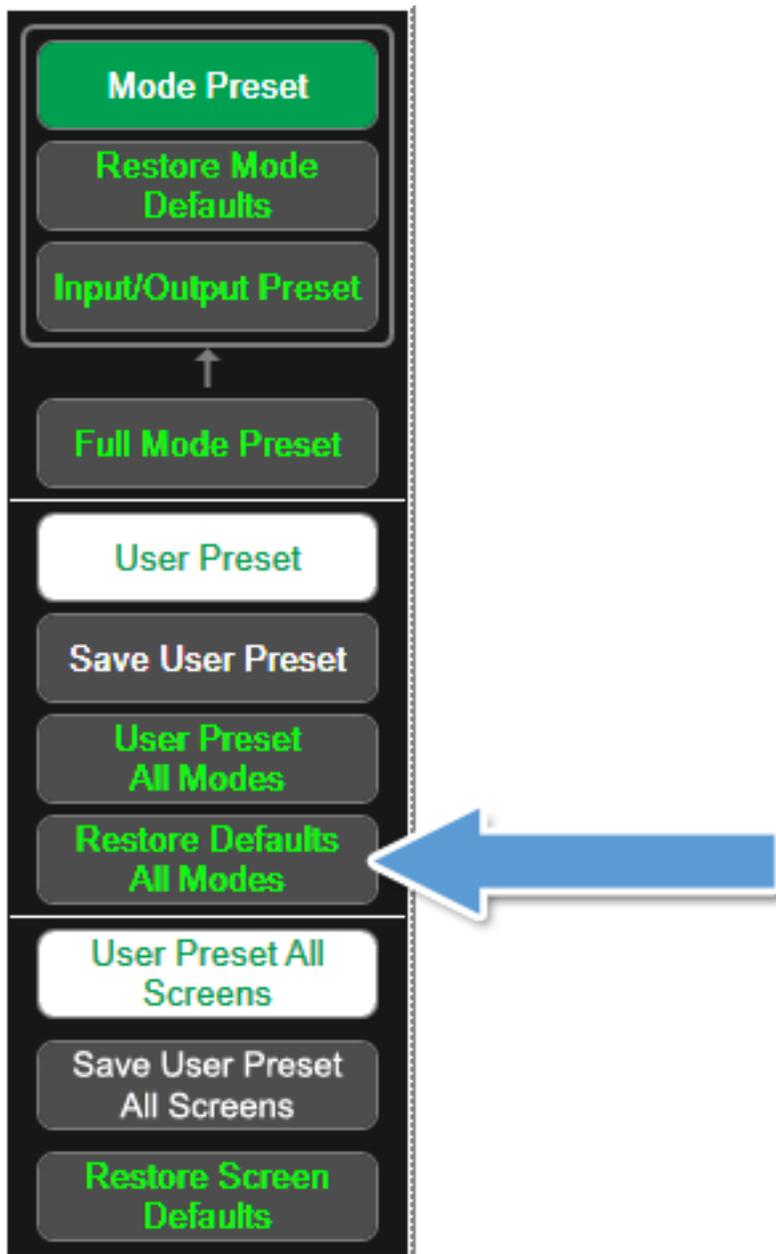

See the "[User Preset](#)" on page 2853 description for more details on User Preset.

Remote Command	<code>:SYSTem:PRESet:USER:ALL</code>
Example	<code>:SYST:PRES:USER:SAVE</code> <code>:SYST:PRES:USER:ALL</code>
Notes	<code>:SYST:PRES:USER:SAVE</code> is used to save the current state as the user preset state
Status Bits/OPC dependencies	Clears all pending OPC bits. The Status Byte is set to 0

5.8 Restore Defaults All Modes

This selection resets all of the Modes in the current Screen back to their default state just as a **Restore Mode Defaults** does, switches the current Screen to the power-on mode, and causes the default measurement for the **Power On Mode** to be active in the current Screen. Only the current Screen is affected.

Restore Defaults All Modes can be executed from the Preset dropdown.

When Restore Defaults All Modes is selected, a message appears saying:

“This will reset all of the variables for all of the Modes in the current Screen to their default state. This action cannot be undone. Do you want to proceed?”

The message provides **OK** and **Cancel** buttons.

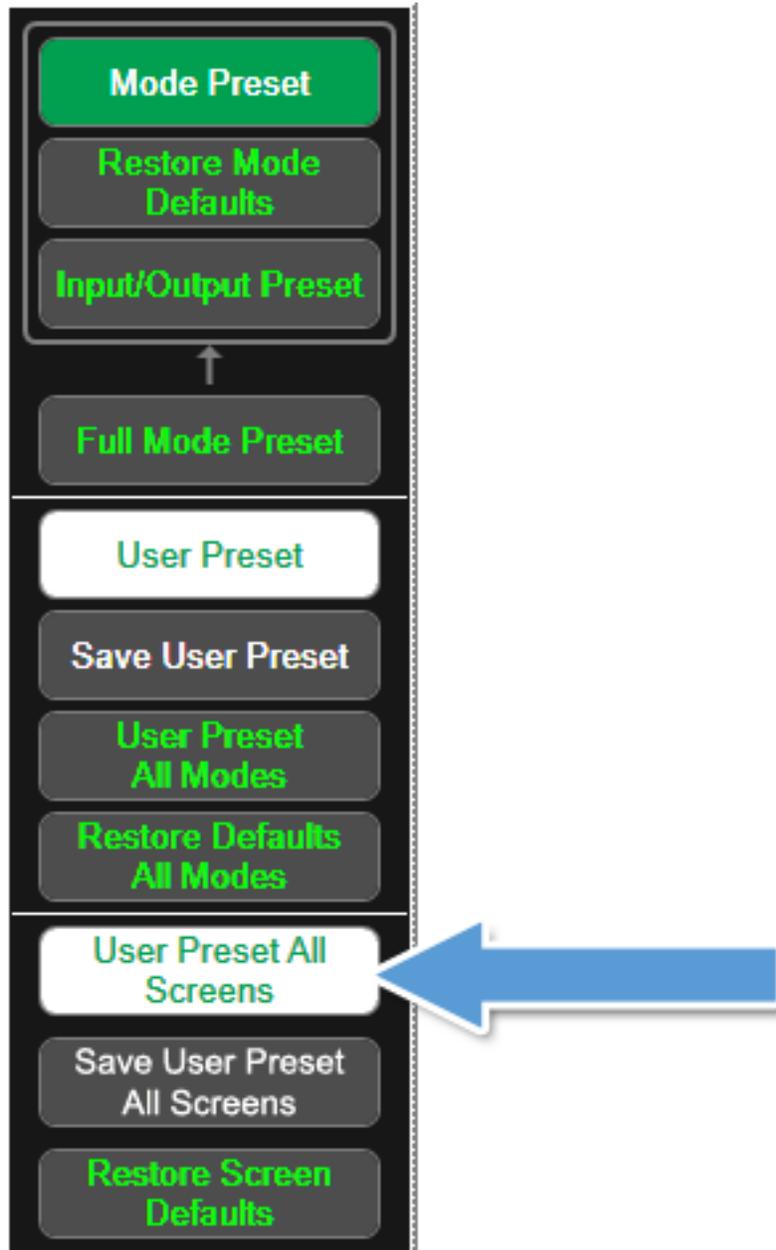

Example	<code>:SYST:DEF MOD</code>
Couplings	Causes the currently running measurement to be aborted, a mode switch to the power-on mode, and activates the default measurement for the power-on mode

5.9 User Preset All Screens

User Preset All Screens recalls a screen configuration previously saved using the **Save User Preset All Screens** function. The complete configuration of all your Screens is loaded, including the state of each Screen.

Because **User Preset All Screens** performs a Recall State as part of its function, it affects all of the variables that normally only reset on Restore Mode Defaults, and it affects the Input/Output variables, because both of these are included in State files.

Note that recalling a screen configuration in this manner will wipe out your current screen configuration and all states of all Screens.

Notes **"Save User Preset All Screens"** on page 2864 is used to save the current screen configuration as the "user preset all screens" configuration

If loading a User Preset All Screens file from a different instrument, some settings may be limited and/or coupled differently, since the capabilities of the mode may have changed from when the User Preset All Screens file was saved

Status Bits/OPC dependencies Clears all pending OPC bits
The Status Byte is set to 0

5.10 Save User Preset All Screens

Saves the current Screen Configuration in a unique location for recall by the **User Preset All Screens** key.

Save User Preset All Screens can be executed from the Preset dropdown.

Besides the screen configuration, *all* of the Mode variables of all Screens are saved, including those reset by Mode Preset and those only reset by Restore Mode Defaults, as well as all of the Input/Output variables, so when you subsequently press the User Preset All Screens key, the instrument returns to the exact Screen setup that existed when you pressed the Save User Preset All Screens control.

Notes

Creates the same file as if you requested a Screen Config + State save, except that **Save User Preset All Screens** does not allow you to specify the filename or the location of the file

5.11 Restore Screen Defaults

This selection resets the Screen configuration to the factory default; deleting all screens, all screen names, all screen states, and setting Multi-Screen to Off. A single screen will remain, set to the power-on Mode in a preset state with the default screen name.

Restore Screen Defaults can be executed from the Preset dropdown.

When Restore Screen Defaults is selected, a message appears saying:

“This function will delete all defined screens and their settings. This action cannot be undone.

Do you want to proceed?”

The message provides **OK** and **Cancel** buttons.

Example

`:SYST:DEF SCReen`

5.12 Preset Type (Remote Command Only)

Remote Command	<code>:SYSTem:PRESet:TYPE FACTory MODE USER</code> <code>:SYSTem:PRESet:TYPE?</code>
Example	<code>:SYST:PRES:TYPE FACT</code>
Notes	This command is supported for backward compatibility only. It is a no-op, which does not change the behavior of any preset operation
Preset	This is unaffected by Preset but is set to MODE on “Restore System Defaults->All”
State Saved	No

5.13 Restart Instrument (Shutdown)

This command shuts down the instrument, then reboots it.

Remote Command `:SYSTem:PUP`

Example `:SYST:PUP`

5.14 Restart Application (Application Shutdown)

This command restarts the instrument application without rebooting the instrument. Before you send this command, make sure you have saved any trace or measurement data that you want to preserve.

Remote Command	<code>:SYSTem:PUP:PROcess</code>
Example	<code>:SYST:PUP:PROC</code> After sending this command, you must wait for the instrument software to restart
Notes	You cannot use <code>*WAI</code> or <code>*OPC?</code> to synchronize operation after a restart. This command stops and restarts the instrument application, thus the SCPI operation is terminated and restarted. A remote program must use fixed wait time to resume sending commands to the instrument. The wait time will be dependent upon which applications are pre-loaded

5.15 System Log Off (Remote Command Only)

This command provides a means to terminate all open Windows applications, and log off the current user. This is equivalent to performing the Windows command “shutdown -l -f -t0”.

Remote Command	<code>:SYSTem:LOFF</code>
Example	<code>:SYST:LOFF</code>
Notes	Initiates an immediate log off of the current user. This exits the instrument application, thus any unsaved measurement result will be lost. You cannot use <code>*WAI</code> or <code>*OPC?</code> to synchronize operation. In addition to the instrument application, all other Windows programs will be terminated, without the opportunity to save any work in progress. To perform a subsequent login and regain instrument operation, human intervention will be required

5.16 Power Standby (Instrument Shutdown)

Pressing the power switch powers down the instrument. You will be notified that shutting down will cause the application to lose unsaved data, and the instrument will wait for you to respond to this prompt before shutting down.

The command below shuts down the instrument in the same way, however you can choose between the normal way (**NORMa1**) or the forced way (**FORCe**). In the **NORMa1** mode, the system waits until you respond to the warning prompt. In the **FORCe** mode, the system shuts down after 20 seconds, and all data will be lost.

If the instrument is not properly shutdown prior to removal of line power, the system will validate the Journaling File System and the Power On Last State (if the instrument is in Power On Last State) during the following power-on. If a problem is detected, a message will be provided indicating that the system 'recovered' from an inappropriate shutdown. This is only an issue if Power On Type is Last State. If the Last State is not valid, the instrument will power up in the last active mode, but will do a Mode Preset.

Remote Command	<code>:SYSTem:PDOWn [NORMa1 FORCe]</code>
Example	<code>:SYST:PDOW</code> Executes a normal shutdown
Notes	If no parameter is sent, NORMa1 is assumed

6 Input/Output

Accesses menus that let you control the Input/Output parameters of the instrument. In general, these are functions associated with external connections to the instrument, either to the inputs or the outputs.

Input/output connections tend to be based on situation-specific hardware set up. For that reason, input/output settings do *not*, in general, change when you perform a Mode Preset. You can revert to the default values in one of three ways:

- Use **Restore Input/Output Defaults**, in the **Input/Output** menu
- Use **System->Restore System Defaults->Input/Output Settings**
- Use **System -> Restore System Defaults->All**

The settings survive a Preset and a Power cycle.

A few Input/Output settings *do* respond to Mode Preset. For example, if the Calibrator is on, **Preset** turns it off, and if DC coupling is in effect, **Preset** switches it to AC. These exceptions are noted in the SCPI tables for the excepted functions.

Input/Output features are common across multiple Modes and Measurements. In general, they do not change when you change Mode or Measurement, although some controls appear only in certain measurements.

6.1 RF Source

Lets you control and configure the internal RF Source. This tab only appears in models that support a built-in independent RF Source, which include E7760B, and modular products such as EXM and VXT.

External Source Control and built-in Tracking Sources are controlled using the **Source** tab in **Meas Setup**.

Dependencies	Only appears in models that support a built-in independent RF Source, such as E7760B, EXM and VXT
--------------	---

6.1.1 RF Output

Sets the source RF power output state.

Remote Command	<code>:OUTPut[:EXternal][:STATE] ON OFF 1 0</code> <code>:OUTPut[:EXternal][:STATE]?</code>
Example	<code>:OUTP OFF</code> <code>:OUTP?</code>
Notes	This setting is for the independent mode and has no effect on the " List Sequencer " on page 2883. If Sequencer is ON , the List Sequencer controls the source output and this key is grayed-out When Sequencer is OFF , makes source leave List Sequencer and this setting is blanked out, taking effect immediately
Dependencies	For E7760B, the RF Output cannot be set to ON if the RF Output port is set to NONE . If you attempt to set RF Output to ON in this situation, the error message -221, "Settings conflict; Source Output is not available while Output Port is None" is displayed <code>:OUTPut:EXternal[:STATE]</code> is supported only when Option ESC is installed. Otherwise, only <code>:OUTPut[:STATE]</code> is supported
Preset	OFF
Range	ON OFF

6.1.2 RF Output Port

Specifies the RF Output Port used by the internal source.

Switching from the RF Output port to one of the RFIO ports changes the transmitter performance of the instrument.

The **NONE** selection is available to allow setting a half-duplex port to an Input, if it was previously assigned as an Output. Set the Output to **NONE** first, then any port can be assigned as an Input.

When using VXT SP900B/11A/15A/16A with Remote Radio Heads (such as the Keysight M1740A mmWave Transceiver for 5G), the choices in the dropdown menu appear as:

Head h RFHD p

For example, if you have two Radio Heads (numbered 1 and 2), each of which have two RF half-duplex ports, the choices for these ports will appear as below:

Head and Port	Choice in dropdown	SCPI parameter
Head 1, port RF Tx/Rx 1	Head 1 RFHD 1	RRH1RFHD1
Head 1, port RF Tx/Rx 2	Head 1 RFHD 2	RRH1RFHD2
Head 2, port RF Tx/Rx 1	Head 2 RFHD 1	RRH2RFHD1
Head 2, port RF Tx/Rx 2	Head 2 RFHD 2	RRH2RFHD2

When using the E7770A Common Interface Unit, outputs may come from the DUT IF OUT ports on the rear of the CIU or the half-duplex ports on the front of the CIU labeled DUT IF In/Out. You would select GUI parameter IF Out n or SCPI parameter IFOutn for the DUT IF OUT ports or GUI parameter IFHD n or SCPI parameter IFHDn for the DUT IF In/Out ports. See ["RF Input Port" on page 2997](#) "Parameters for VXT SP900B/11A/15A/16A and EXM when used with Radio Heads/CIU" for more details.

Remote Command	<pre>[:SENSe]:FEED:RF:PORT:OUTPut RFOut RFIO1 RFIO2 RFIO3 RFIO4 RFHD RFFD A1 A2 A3 B1 B2 B3 IFIO1 IFIO2 GEN TR RRHhRFHDp IFOutn IFHDn NONE</pre> <p>For details of each option, see "More Information" on page 2876</p> <pre>[:SENSe]:FEED:RF:PORT:OUTPut?</pre>
Example	<pre>:FEED:RF:PORT:OUTP RFO</pre> <p>Set output to RF Output</p> <pre>:FEED:RF:PORT:OUTP RRH1RFHD2</pre> <p>Set output to Radio Head 1, RF Tx/Rx Port 2</p>
Notes	<p>The RRHhRFHDp parameter is used to select a port on a Radio Head (such as the Keysight M1740A mmWave Transceiver) as an output. The SCPI parameter RRHhRFHDp corresponds to Head h, port RF Tx/Rx p; for example, RRH1RFHD2 = the port labeled RF Tx/Rx 2 on Head 1</p>
Dependencies	<p>Only appears in models that support multiple output ports. If the SCPI command is sent with unsupported parameters in any other model, an error is generated, -221, "Settings conflict; option not installed"</p> <p>RFHD and RFFD are only available on VXT. Option HDX is required to enable RFHD port. Option FDX is required to enable RFFD port</p> <p>For E7760B: Ports IFIO1 and IFIO2 are available if Option RF2 is installed. Ports A1, A2, A3, B1, B2, B3 are available if Option RF3 is installed. Attempting to select a port for which the option is not present generates the error, -241, "Hardware missing; Output not available"</p> <p>A port cannot be selected as an Output while it is occupied as an Input. If the SCPI command is sent while the port is occupied, an error is generated, -221, "Settings conflict; Output Port is not available while occupied by Input"</p>

6 Input/Output
6.1 RF Source

Additionally, the mmWave ports are divided into two banks: the A Bank and the B Bank. A port cannot be selected as an Output if any port on the *same* bank is occupied as an Input. If the SCPI command is sent for this situation, an error is generated, -221 "Settings conflict; Output Port is not available while port bank is occupied by Input"

Lastly, if RF3 is present, and RF4 is absent, a mmWave port cannot be selected as an Output if the Input Port is occupied by mmWave Transceiver with a different frequency range. If the SCPI command is sent for this situation an error is generated, -221 "Settings conflict; Output Port is not available while occupied by Input of incompatible frequency"

Ports GEN and TR are only available in modular analyzers, and only when the M9470A module is installed, such as in M8920A. Option HDX is required to enable the T/R port

When any output is selected in a measurement that does not support it, the "No result; Meas invalid with this output" error condition occurs, and the measurement returns invalid data when queried

Preset	Unaffected by Mode Preset , but set to default by Source Preset or Restore System Defaults -> All
State Saved	Saved in State
Backwards Compatibility SCPI	:FEED:RF:PORT:OUTPut IFIO1 IFIO1 is treated as IF01 , and sets the IF output to be the port labeled DUT IF Out on the CIU rear panel. This is for compatibility with earlier implementations on EXM and VXT when using the E7770A Common Interface Unit

More Information

Here are full details of the RF Output Port settings:

Value	Example	Notes
RF Output	:FEED:RF:PORT:OUTP RFO	On EXM with hardware M9430A, if RF Output is selected as RF Output Port, use the settings in the Half Duplex Config menu to determine which port (RFIO3 or RFIO4) will be used On EXM with hardware M9431A, this setting is not supported. If the SCPI command is sent with this setting, an error is generated, -221, "Settings conflict; option not installed"
RFHD	:FEED:RF:PORT:OUTP RFHD	RFHD port is exclusive for RF Input and RF Output. If HD Port is chosen as RF Input port, pressing this key, or sending SCPI to set it, generates error message: "-221, Settings conflict; RFHD is being used as RF Input Port" Option HDX is required to enable RFHD port
RFFD	:FEED:RF:PORT:OUTP RFFD	Option FDX is required to enable RFFD port
Gen	:FEED:RF:PORT:OUTP GEN	Selects the Gen port on M8920A
T/R	:FEED:RF:PORT:OUTP TR	Selects the T/R port on M8920A

6.1.3 Half Duplex Output Port

Specifies whether **RFIO3** or **RFIO4** is the Half Duplex Output port.

Remote Command	<code>[:SENSe]:HDUPlex:PORT:OUTPut RFIO3 RFIO4</code>
Example	<code>:HDUPlex:PORT:OUTPut RFIO3</code> <code>:HDUPlex:PORT:OUTPut?</code>
Dependencies	Only appears in EXM If RFIO3 is selected as “Half Duplex Input Port”, then “Half Duplex Output Port” will be set to RFIO4 automatically If RFIO4 is selected as “Half Duplex Input Port”, then “Half Duplex Output Port” will be set to RFIO3 automatically
Preset	RFIO4
State Saved	Saved in State

6.1.4 RF Power

Allows you to control the amplitude of the Source output. Same as "RF Power" on page 2878 in **Amplitude Setup**.

Example	<code>:SOUR:POW -100 dBm</code>
---------	---------------------------------

6.1.5 T/R Port High Power Attenuator

Controls whether additional attenuation is added at the T/R Port. The T/R port has two output paths, one that provides a 16 dB attenuator, another that bypasses this attenuator. When this control is **ON**, the path includes the 16 dB attenuator, so the maximum output level for this path is 0 dBm. When this control is **OFF**, the 16 dB attenuator is bypassed, so the maximum output level for this path is +5 dBm.

Example	<code>:FEED:RF:PORT:TR:HPOW:ATT ON</code>
---------	---

6.1.6 Amplitude Setup

Allows you to access the **Amplitude Setup** panel.

Notes	This menu under this control is for independent mode, and has no effect on "List Sequencer" on page 2883. If "Sequencer" on page 2884 is ON , the List Sequencer controls the source output, and this control is grayed-out on the front panel, to indicate out-of-scope. When you set "Sequencer" on page 2884 to OFF , makes source leave List Sequencer and this control is blanked out
-------	--

6.1.6.1 RF Power

Allows you to adjust the power level of the source using the numeric keypad, step keys, or RPG. Pressing any digit, 0 through 9 on the numeric keypad displays the unit terminator.

Please refer to the "RF Power Range" on page 2879 table below for the valid ranges.

Remote Command	<code>:SOURce:POWer[:LEVel][:IMMediate][:AMPLitude] <ampl></code> <code>:SOURce:POWer[:LEVel][:IMMediate][:AMPLitude]?</code>
Example	<code>:SOUR:POW -100 dBm</code>
Notes	<p>Amplitude corrections can be specified for use with the source. In the event of amplitude corrections being applied, the valid ranges for the RF power do not change dependent on the current amplitude correction setting. If the combination of RF power + amplitude correction is higher or lower than the source output range, the Source Unleveled bit is set, and the "Source Unleveled" indicator will appear on status panel to indicate that the source cannot maintain the output power that has been requested</p> <p>When signal generator is unable to maintain the requested output level, the "Source Unleveled" indicator will appear on status panel. When the source output setting is restored to the normal range, the "Source Unleveled" is removed from status panel</p> <p>Internal source has list sequence mode, which comprises of several steps which contain separate output power, frequency and waveform etc. When the source list sequence playing is complete, the last step keeps playing, and user can use this command to change the list sequence last step's output power</p> <p>For EXT, The multiport adapter RFIO TX ports and GPS ports cannot ensure power accuracy when power setting is lower than -130dBm, this power setting value is defined by the sum of RF Power setting and related amplitude correction value. But user settable value could be lower than this limit. When application detected there exists power setting lower than -130dBm on MPA RFIO TX ports, then popup warning message . When application detected there exists power setting lower than -130dBm on MPA GPS ports, then popup warning message . This is only warning message, and check is performed when RF is ON</p>
Dependencies	The RF power is dependent on the RF output port and frequency, such that the current frequency and selected output port determine the valid range of power values
Couplings	For VXT models SP900B/11A, if AWGN State is ON and ARB State is ON , this setting is adjusted to the value to maintain the AWGN power relationship defined by Power Control Mode and other noise settings
Preset	-100 dBm
Min	The range of values depends on the current frequency and selected RF output port. See "RF Power Range" on page 2879 below for the valid ranges
Max	The range of values depends on the current frequency and selected RF output port. Refer to "RF Power Range" on page 2879 below for the valid ranges

RF Power Range

RF Output Port	Frequency Range	Min Output Power	Max Output Power
High Power RF Out	10 MHz \leq f \leq 6 GHz	-150 dBm	20 dBm
RFIO 1 & RFIO 2	10 MHz \leq f \leq 6 GHz	-150 dBm	0 dBm

Note: This is the UI power range, which is larger than the actual specification.

VXT model SP900B

RF Output Port	Frequency Range	Min Output Power	Max Output Power without Option "1EA"	Max Output Power with Option "1EA"
RF Output	60 MHz \leq f \leq 6 GHz	-150 dBm	10 dBm	25 dBm
RFHD	60 MHz \leq f \leq 6 GHz	-150 dBm	10 dBm	15 dBm
RFFD	60 MHz \leq f \leq 6 GHz	-150 dBm	0 dBm	0 dBm

Note: This is the UI power range, which is larger than the actual specification.

Note 1: Max output power with Option 1EA can be set to 25 dBm, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when output power set higher than 20 dBm.

VXT models SP900B/11A

Ports	Option LFE	Frequency Range	Min Output Power	Max Output Power without option "1EA"	Max Output Power with "1EA"
RF Output	With Option LFE	1 MHz \leq f \leq 60 MHz	-150 dBm	5 dBm	5 dBm
		60 MHz \leq f \leq 380MHz	-150 dBm	5 dBm	25 dBm
	Without Option LFE	380 MHz \leq f \leq 6 GHz	-150 dBm	5 dBm	25 dBm
RFHD		1 MHz \leq f \leq 6 GHz	-150 dBm	5 dBm	5 dBm

Note: Min Output Power is the UI power range, which is smaller than the actual specification.

6 Input/Output
6.1 RF Source

Note1: Max output power with Option 1EA can be set to 25 dBm for RF Output Port, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when the output power is set higher than 20 dBm.

Note2: Option LFE provides Low Frequency Extension, which covers frequency from 1 MHz to 380 MHz.

VXT models SP900B/16A

RF Output Port	Frequency Range	Min Output Power	Max Output Power without Option "1EA"	Max Output Power with Option "1EA"
RF Output	380 MHz ≤ f ≤ 12.3 GHz	-150 dBm	5 dBm	25 dBm
RFHD	380 MHz ≤ f ≤ 12.3 GHz	-150 dBm	5 dBm	18 dBm

Note1: For RF output port, the Max output power with Option 1EA can be set to 25 dBm for RF Output Port, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when the output power is set higher than 20 dBm.

Note2: For RFHD port, the Max output power with Option 1EA can be set to 18 dBm for RF Output Port, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when the output power is set higher than 15 dBm.

6.1.6.2 Set Reference Power

Turns the power reference state to **ON**, sets the reference power value to the current RF output power, maintains this power at the RF output, and sets the displayed power to 0.00 dB. All subsequent RF power values entered under **Source**, **Amplitude**, **RF Power** are interpreted as being relative to this reference power.

When you use a power reference, the signal generator outputs an RF power that is set relative to the reference power by the value entered under **Source**, **Amplitude**, **RF Power** as follows:

Output power = reference power – entered power

Where:

- reference power equals the original RF Power entered under **Source>Amplitude>RF Power** and set as the reference power
- entered power equals a new value entered under **Source>Amplitude>Amptd Offset**

In addition, the displayed power value is the same as a new value entered under **Source, Amplitude, RF Power**.

NOTE

If **Power Ref** is **ON** with a reference value set, entering a value under **Source, Amplitude, RF Power** and pressing **Set Reference Power** adds that value to the existing **Power Ref** value.

If you wish to change the reference power value to a new value entered under **Source, Amplitude, RF Power**, first set **Power Ref** to **OFF**, then press **Set Reference Power**.

Dependencies Unavailable, and grayed-out, when "[List Sequencer](#)" on page 2883 is **ON**

6.1.6.3 Power Ref

Allows you to toggle the state of the power reference. When you use a power reference, the signal generator outputs an RF power that is set relative to the reference power by the value entered under **Source>Amplitude>RF Power** as follows:

Output power = reference power + entered power

Where:

- reference power equals the original RF Power entered under **Source>Amplitude>RF Power** and set as the reference power
- entered power equals a new value entered under **Source>Amplitude>Amptd Offset**

For more information on Reference Frequency, see "[Set Reference Power](#)" on page 2880.

Remote Command	<code>:SOURCE:POWer:REFerence <ampl></code> <code>:SOURCE:POWer:REFerence?</code> <code>:SOURCE:POWer:REFerence:STATe OFF ON 0 1</code> <code>:SOURCE:POWer:REFerence:STATe?</code>
Example	<code>:SOUR:POW:REF 0.00 dBm</code> <code>:SOUR:POW:REF:STATe ON</code>
Dependencies	Unavailable and grayed-out when " List Sequencer " on page 2883 is ON
Couplings	Coupled to " Set Reference Power " on page 2880, such that pressing Set Reference Power updates the reference power with the current output power
Preset	0.00 dBm OFF
Min	-125.00 dBm
Max	10.00 dBm

6.1.6.4 Power Unit

Modifies the units for RF Power and Power Ref. The change is immediate and does not force a restart.

Remote Command	<code>:SOURce:POWer[:LEVel][:IMMediate][:AMPLitude]:UNIT DBM W V DBUV</code> <code>:SOURce:POWer[:LEVel][:IMMediate][:AMPLitude]:UNIT?</code>
Example	<code>:SOUR:POW:UNIT V</code> Sets the RF Power units to volts
Couplings	RF Power and Power Ref units are modified by Power Unit
Preset	dBm
State Saved	Saved in Instrument State

6.1.6.5 Amptd Offset

Allows you to specify the RF output power offset value.

When the amplitude offset is set to zero (0) and you set a new offset value (positive or negative), the displayed amplitude value changes as follows and the RF output power does not change:

Displayed value = output power + offset value

Where:

- output power equals the original RF Power entered under **Source, Amplitude, RF Power**
- offset value equals the value entered under **Source, Amplitude, Amptd Offset**

When the amplitude offset is set to a value other than zero (0) and you enter a new RF power value under **Source, Amplitude, RF Power**, the displayed power will be the same as the value entered and the RF output power will be equal to the value entered minus the offset value as follows:

Output power = entered power – offset power

Displayed Power = output power + offset power

Displayed power = entered power

Where:

- entered power equals the amplitude entered under **Source, Amplitude, RF Power**

- offset power equals the value previously entered and set under **Source, Amplitude, Amptd Offset**

Remote Command	<code>:SOURce:POWer[:LEVel][:IMMediate]:OFFSet <rel_amp1></code> <code>:SOURce:POWer[:LEVel][:IMMediate]:OFFSet?</code>
Example	<code>:SOUR:POW:OFFS 0.00 dB</code>
Notes	The amplitude Offset unit follows the units set in Power Unit
Dependencies	Unavailable, and grayed-out, when List Sequencer is ON
Preset	0.00 dB
Min	-200.00 dB
Max	200.00 dB

6.1.6.6 Amplitude Increment

Changes the step size for the RF Power function. Once an increment size has been selected and the RF Amplitude function is active, the step keys (and the **UP | DOWN** parameters for RF Power from remote commands) change the RF Power by the set value. This feature exists in EXG and MXG.

Remote Command	<code>:SOURce:POWer:STEP[:INCRement] <amp1></code> <code>:SOURce:POWer:STEP[:INCRement]?</code>
Example	<code>:SOUR:POW:STEP 1</code>
Notes	The Amplitude Increment unit follows the units set in Power Unit
Couplings	Coupled to the Step size of the RF Power function
Preset	1 dB
Min	0.1 dB
Max	10 dB

6.1.7 Frequency

Allows you to control the frequency of the Source. Same as **"Frequency" on page 2910** under **"Frequency Setup" on page 2910**.

Example	<code>:SOUR:FREQ 1.00 GHz</code>
---------	----------------------------------

6.1.8 List Sequencer

Accesses sub-menus for configuring the **List Sequencer**.

List sequences allow you to enter frequencies and amplitudes at unequal intervals in nonlinear ascending, descending or random order. Each step within the list can also include its own waveform file for playback, step duration, trigger event and trigger output.

The complexities involved in configuring the **List Sequencer** do not lend themselves to manual configuration; hence the manual configuration for this feature is limited. For easier configuration of the List Sequencer, it is recommended that you use either SCPI, or load a tab-delimited file containing the setup parameters in a tabular form. The details of the SCPI for configuring the List Sequencer can be found in "[Step Configuration \(Remote Command Only\)](#)" on page 2901.

Once the **List Sequencer** has been configured using the front panel, SCPI, or by loading a tab-delimited file, the sequence must be initiated using the front panel **Initiate Sequence** key, or the corresponding SCPI command.

Dependencies	Not available in E7760B
--------------	-------------------------

6.1.8.1 Sequencer

Sets the state of "[List Sequencer](#)" on page 2883

- When **List Sequencer** is **ON**, the source outputs the sequence defined by the sequencer
- When **List Sequencer** is **OFF**, the source outputs a single waveform segment or sequence (independent mode) at a single frequency and amplitude

Remote Command	<code>:SOURce:LIST[:STATe] ON OFF 1 0</code> <code>:SOURce:LIST[:STATe]?</code>
----------------	--

Example	<code>:SOUR:LIST OFF</code>
---------	-----------------------------

Notes	When the sequencer is ON , the List Sequencer controls the output of the source
-------	--

Dependencies	Not available in E7760B
--------------	-------------------------

Couplings	When in Sequence Analyzer Mode, and the List Sequencer state is OFF , Include Source is forced to NO , and the Include Source key is grayed-out When in Sequence Analyzer Mode, and the List Sequencer state is ON , Include Source is available to set, and an ARB memory related operation such as load or delete will be rejected
-----------	---

Preset	OFF
--------	------------

Range	ON OFF
-------	------------------------

6.1.8.2 Initiate Sequence

Arms the sequence for single execution. Once the sequence is armed, the source begins the sequence as soon as the trigger is received. If trigger is set to **Free Run**, the sequence starts immediately.

Remote Command	<code>:SOURce:LIST:TRIGger[:IMMediate]</code>
Example	<code>:SOUR:LIST:TRIG</code>
Notes	<p>When in Sequence Analyzer Mode, and Include Source is ON, the Initiate List Sequencer operation is rejected, and the key is grayed-out. If the file needed by the sequencer is not already in ARB memory, the sequence cannot be initiated, and an error is generated.</p> <p>There is a blocking SCPI query that can be used to check whether source list sequence was initiated successfully (see "Remote Software Trigger (Remote command Only)" on page 2909).</p>
Dependencies	<p>In Sequence Analyzer Mode, if Meas Setup, Include Source is set to YES, Source, List Sequencer, Initiate Sequence is disabled.</p> <p>Not available in E7760B</p>

6.1.8.3 Repetition

Accesses a sub-menu to select the repetition type for the List Sequencer globally. It cannot be changed between different sequence steps.

In **Single**, the Source list plays one time after initiation. In **Continuous**, the Source list plays continuously after initiation.

This setting is available on EXM.

Remote Command	<code>:SOURce:LIST:REPetition:TYPE SINGle CONTInuous</code>
Example	<code>:SOUR:LIST:REP:TYPE SING</code> <code>:SOUR:LIST:REP:TYPE?</code>
Dependencies	<p>Available on EXM</p> <p>Not available in E7760B</p>
Preset	<code>SINGle</code>
Range	<code>SINGle CONTInuous</code>

6.1.8.4 Trig Out Type

Accesses a sub-menu to select the output trigger type for the List Sequencer globally. It cannot be changed between different sequence steps. It sets the output trigger type for the whole source sequence.

Remote Command	<code>:SOURce:LIST:TRIGger:OUTPut:TYPE STEP MARKer</code> <code>:SOURce:LIST:TRIGger:OUTPut:TYPE?</code>
Notes	<p><code>STEP</code> = Start of Step</p> <p><code>MARKer</code> = Data Marker</p>
Dependencies	<p>Available on EXM</p> <p>Not available in E7760B</p>

Preset	<code>STEP</code>
Backwards Compatibility SCPI	<code>:SOURce:LIST:TRIGgerout:TYPE</code> <code>BEGInningofstep</code> <code>DATaMarker</code>

6.1.8.5 Select Data Marker

When "Trig Out Type" on page 2885 is set to Data **MARKer**, specifies which marker to route.

Remote Command	<code>:SOURce:LIST:TRIGger:OUTPut:TYPE:MARKer</code> <code>M1</code> ... <code>M4</code>
Backwards Compatibility SCPI	<code>:SOURce:LIST:TRIGgerout:TYPE:Marker</code>

6.1.8.6 Manual Trigger Now

Provides a software trigger event to the List Sequencer. During execution of a sequence, if the sequencer is halted on any step that has been configured with a "Manual" step trigger, then this keypress causes the sequencer to continue and execute the step.

Notes	No remote command, front panel only
-------	-------------------------------------

6.1.8.7 List Sequencer Setup

Accesses the List Sequencer setup menus.

Number of Steps

Allows you to specify the number of steps within the list sequence.

Remote Command	<code>:SOURce:LIST:NUMBer:STEPs</code> <code><integer></code> <code>:SOURce:LIST:NUMBer:STEPs?</code>
Example	<code>:SOUR:LIST:NUMB:STEP 1</code>
Notes	Increasing the number of steps creates additional steps at the end of the list, with all the settings within the steps set to their default values Decreasing the number of steps removes steps from the end of the list. The settings within the removed steps are not reset. This means that increasing the number of steps again would allow you to retrieve these steps
Dependencies	The Step Count parameter is increased or decreased when you insert or delete a point from within the

	GUI interface to the sequencer Not available in E7760B
Preset	1
Min	1
Max	1000

Go To Step

Allows you to select the step number you wish to view or edit.

Preset	1
Min	1
Max	Step Count

Insert Step Before

Inserts a new step, with default values, before the currently selected step. Inserting a step automatically increases the Step Count parameter by 1. If a sequence has already reached the upper limit of 1000 steps, then this operation is rejected, and error -221, "Setting Conflict; Cannot insert more steps, maximum number of steps reached" is displayed.

Notes	If the list already contains the maximum limit (1000 steps), pressing this control has no effect
-------	--

Delete Step

Deletes the current step. Deleting a step automatically decreases the Step Count parameter by 1. If the sequence only has one step left, then this operation is rejected, and error -221, "Setting conflict; Cannot delete current step, minimum number of steps reached" is displayed

Notes	If the list already contains the minimum limit of 1 step, pressing this control has no effect
-------	---

Clear List

Clears the list. Clearing the list sets the number of steps to the default value (1) and sets the parameters for the only step to their default values.

Step Trigger

Allows you to select the trigger input for the current step.

6 Input/Output
6.1 RF Source

Remote Command	<code>:SOURCE:LIST:STEP[1] 2 ... 1000:SETup:INPut:TRIGger IMMEDIATE INTERNAL EXTERNAL2 KEY BUS EXTERNAL4</code> For details of options, see " More Information " on page 2888 <code>:SOURCE:LIST:STEP[1] 2 ... 1000:SETup:INPut:TRIGger?</code>
Example	<code>:SOUR:LIST:STEP2:SET:INP:TRIG BUS</code> <code>:SOUR:LIST:STEP2:SET:INP:TRIG?</code>
Notes	SCPI is supported after A.09.40
Dependencies	Not available in E7760B
Preset	<code>IMMEDIATE</code>
Range	<code>IMMEDIATE INTERNAL EXTERNAL2 KEY BUS EXTERNAL4</code>

More Information

Parameter	SCPI Example	Notes
Free Run	<code>:SOUR:LIST:STEP2:SET:INP:TRIG IMM</code>	Sets the trigger input for the current step to Free Run
Internal	<code>:SOUR:LIST:STEP2:SET:INP:TRIG INT</code>	Sets the trigger input for the current step to Internal
Manual (Trigger Key)	<code>:SOUR:LIST:STEP2:SET:INP:TRIG KEY</code>	Sets the trigger input for the current step to Manual (Trigger Key). Any step in the sequence set to Manual will cause the sequence execution to stop until the manual trigger key is pressed. Sending the Bus Trigger SCPI command will have no effect. At any point in the sequence where the List Sequencer is paused waiting for a software trigger, a pop-up dialog is displayed until the trigger event occurs
Bus	<code>:SOUR:LIST:STEP2:SET:INP:TRIG BUS</code>	Sets the trigger input for the current step to Bus. Any step in the sequence set to Bus will cause the sequence execution to stop until the Bus Trigger command is sent. Pressing the manual trigger key has no effect. At any point in the sequence where the List Sequencer is paused waiting for a software trigger, a pop-up dialog is

Parameter	SCPI Example	Notes
External 2	<code>:SOUR:LIST:STEP2:SET:INP:TRIG EXT2</code>	<p>displayed until the trigger event occurs</p> <p>Sets the trigger input for the current step to External 2</p> <p>Note: When on EXM, trigger 2 is a bi-directional trigger port. So, when trigger 2 has been configured as OUTPUT type, choosing External 2 as the input trigger for the current step will generate error</p>

Transition Time

Allows you to specify the transition time for the current step.

The following table lists recommended values for appropriate settling times to allow for changes within the source.

Value Changed	Recommended Transition Time
Frequency	500 μ s
Amplitude	100 μ s to within 0.1 dB 20 μ s to within 1.0 dB

If the Transition Time value is shorter than the time necessary for the hardware to settle and a List Sequence is initiated, a **warning** is generated. If the Transition Time value is longer than the Step Duration, an error is generated when initiating a source list sequence. For source list sequence, transition time is included in the step duration length. If the Transition Time value is longer than the Step Duration Time, the real step duration length is extended to equal the transition time and cause a timing shift.

Remote Command	<code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:TRANsition:TIME <time></code> <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:TRANsition:TIME?</code>
Example	<code>:SOUR:LIST:STEP2:SET:TRAN:TIME 1ms</code> <code>:SOUR:LIST:STEP2:SET:TRAN:TIME?</code>
Notes	SCPI is supported after A.09.40
Dependencies	Not available in E7760B
Preset	1.0 ms
Min	0.0 ms
Max	4.0 ks

Band

Allows you to select the radio band for use in the current step.

Remote Command `:SOURce:LIST:STEP[1]|2|...|1000:SETup:RADio:BAND <band>`

where `<band>` is one of:

NONE | PGSM | EGSM | RGSM | DCS1800 | PCS1900 | GSM450 | GSM480 |

N 261	5G NR	:SOUR:LIST:STEP2:SET:RAD:BAND N261

Device

Allows you to specify the radio band link direction for the steps within the list sequence. The link is used in conjunction with the channel band and channel number to determine the output frequency.

Setting	Option	Description
Uplink	UP	The source calculates the uplink frequency according to an uplink formula together with selected channel band and channel number
Downlink	DOWN	The source calculates the downlink frequency according to a downlink formula together with selected channel band and channel number

Remote Command	:SOURce:LIST:STEP[1] 2 ... 1000:SETup:RADio:BAND:LINK DOWN UP :SOURce:LIST:STEP[1] 2 ... 1000:SETup:RADio:BAND:LINK?
Example	:SOUR:LIST:STEP2:SET:RAD:BAND:LINK UP :SOUR:LIST:STEP2:SET:RAD:BAND:LINK?
Notes	SCPI is supported after A.09.40
Dependencies	Not available in E7760B
Preset	DOWN
Range	DOWN UP

Freq/Chan

Allows you to select the frequency or channel value for the current step. If the Band selection for the current row is **NONE**, you enter a frequency. Otherwise, enter a channel, which causes the frequency to be automatically selected, based on the Band selection.

Entering a Frequency

If the Band selection for the current row is **NONE**, enter a Frequency. This field in the table allows you to select the frequency value for the current step.

Remote Command	<code>:SOURCE:LIST:STEP[1] 2 ... 1000:SETup:CNFRrequency <double></code> <code>:SOURCE:LIST:STEP[1] 2 ... 1000:SETup:CNFRrequency?</code>										
Example	<code>:SOUR:LIST:STEP2:SET:CNFR 1GHz</code> <code>:SOUR:LIST:STEP2:SET:CNFR?</code>										
Notes	SCPI is supported after A.09.40 Used to setup channel number or frequency setting, according to the current Radio Band setting. If Radio Band is NONE , then the value is frequency. If Radio Band is not NONE , then the value is channel number										
Dependencies	Not available in E7760B										
Couplings	The frequency value is coupled to the channel band and number for the step, such that updates to the radio band and channel number will update the frequency value to the corresponding absolute frequency. The reverse is also true, changing the frequency value causes the value of the channel number to be updated										
Preset	1.00 GHz										
Min	10.00 MHz										
Max	Hardware Dependent: <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td>Option 503</td> <td>3.6 GHz</td> </tr> <tr> <td>Option 504</td> <td>3.9 GHz</td> </tr> <tr> <td>Option 506</td> <td>6.00 GHz</td> </tr> <tr> <td>Option F06</td> <td>6.08 GHz</td> </tr> <tr> <td>Option F06 & EP6</td> <td>6.60 GHz</td> </tr> </table>	Option 503	3.6 GHz	Option 504	3.9 GHz	Option 506	6.00 GHz	Option F06	6.08 GHz	Option F06 & EP6	6.60 GHz
Option 503	3.6 GHz										
Option 504	3.9 GHz										
Option 506	6.00 GHz										
Option F06	6.08 GHz										
Option F06 & EP6	6.60 GHz										

Entering a Channel

If the Band selection for the current row is not **NONE**, enter a Channel Number. This field in the table allows you to select the channel value for the current step. The frequency is selected automatically, based on the Band.

Example	<code>:SOUR:LIST:STEP2:SET:CNFR 124</code>
---------	--

	<code>:SOUR:LIST:STEP2:SET:CNFR?</code>
Notes	SCPI is supported after A.09.40 Used to setup channel number or frequency setting, according to current Radio Band setting. If Radio Band is NONE , then the value is a frequency. If Radio Band is not NONE , then the value is a channel number
Dependencies	Not available in E7760B
Couplings	The channel number is coupled to the step frequency value. When the step frequency value is changed, the channel number increases or decreases to match the new step frequency. If the step frequency is not at an exact match for a channel number, the nearest channel number is displayed, along with a greater-than or less-than sign, to indicate the frequency is above or below the channel number
Preset	1
Min/Max	0/10838 (See "Channel" on page 2912 for valid ranges)

Power

Allows you to specify the power value for the current step.

Remote Command	<code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:AMPLitude <double></code> <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:AMPLitude?</code>
Example	<code>:SOUR:LIST:STEP2:SET:AMPL -50dBm</code> <code>:SOUR:LIST:STEP2:SET:AMPL?</code>
Dependencies	The RF power is dependent on the RF output port and frequency, such that the current frequency and selected output port determine the valid range of power values Not available in E7760B
Preset	-100 dBm
Min/Max	The range of values depends on the current frequency and selected RF output port See "RF Power" on page 2878 and the RF Power Range table for valid ranges

Waveform

Allows you to select the waveform to be played back during the current step. Options are: CW, a Waveform file, Continue the previous step's waveform, or Off.

Remote Command	<code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:WAVEform <string></code> where <code><string></code> is one of: <code>"CW"</code> , <code>"waveform name"</code> , <code>"Cont"</code> , <code>"Off"</code> For full details of options, see "More Information" on page 2897 <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:WAVEform?</code>
Example	<code>:SOUR:LIST:STEP2:SET:WAV "CW"</code>

	<code>:SOUR:LIST:STEP2:SET:WAV?</code>
Notes	SCPI is supported after A.09.40
Dependencies	Not available in E7760B For VXT models SP900B/11A/16A, if the Waveform is not Continue Previous, there is always a time gap between the current step and the previous step
Preset	<code>CW</code>
Range	<code>"CW", "waveform name", "Cont", "Off"</code>

More Information

Parameter	SCPI Example	Notes
CW	<code>:SOUR:LIST:STEP2:SET:WAV "CW"</code>	Sets the current step to output a CW tone
Selected Waveform	<code>:SOUR:LIST:STEP2:SET:WAV "waveform name"</code>	Inserts a waveform from the Select Waveform dialog as the waveform for playback during the current step If the selected waveform contains header (which contains ARB play parameters), source list sequence will automatically apply header settings of the selected waveform in that step
Continue Previous	<code>:SOUR:LIST:STEP2:SET:WAV "Cont"</code>	Sets the current step to continue with playback of the waveform from the previous step. When continuing the previous waveform, the ARB playback will not pause while the source retunes to the new frequency or amplitude that may be defined for the new step
Off	<code>:SOUR:LIST:STEP2:SET:WAV "Off"</code>	Disable RF output of the current step

Waveform File

Pressing the slide-aside field of this column (>) opens the **"Select Waveform"** on [page 2959](#) screen, which lets you select a waveform in ARB memory to playback during the current step. When you select a waveform, and press **OK**, it returns to the List Sequencer Setup screen with that file name in the table.

Step Duration

Allows you to select the duration of play for the current step.

The duration can be set to be either the number of times for the ARB file associated with the sequence to play, or a specific time value, or continuous. If the step is set to play a CW tone, the step duration cannot be set to a play count.

Remote Command	<code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:DURation:TYPE TIME COUNT CONTInuous CABort</code> For option details, see "More Information" on page 2898 <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:DURation:TYPE?</code>
Example	<code>:SOUR:LIST:STEP2:SET:DUR:TYPE TIME</code> <code>:SOUR:LIST:STEP2:SET:DUR:TYPE?</code>
Dependencies	Not available in E7760B If in VXT models SP900B/11A/16A, Step Duration is TIME or Play COUNT , only Free Run is available for the next step. Otherwise, an error message is generated: "Parameter error; only Free Run is available as step trigger on step<n>"
Range	TIME COUNT CONTInuous CABort

More Information

Parameter	SCPI Example	Notes
Time	<code>:SOUR:LIST:STEP2:SET:DUR:TYPE TIME</code>	Sets the duration of the current step to be a time value for the length of time the step will play When TIME is selected, the Time may be set using the second field under Step Duration and/or by the "Duration Time" on page 2899 command
Count	<code>:SOUR:LIST:STEP2:SET:DUR:TYPE COUN</code>	Sets the duration of the current step to be an integer value for the number of times (play count) the ARB file is selected for playback during this step. For example, a 5 second ARB will be set to play 5 times during the step When COUNT is selected, the Count may be set using the second field under Step Duration and/or by the "Play Count" on page 2900 command
Continuous	<code>:SOUR:LIST:STEP2:SET:DUR:TYPE CONT</code>	Sets the current step to be played continuously until the next step starts. The waveform

Parameter	SCPI Example	Notes
Continuous Abort	<code>:SOUR:LIST:STEP2:SET:DUR:TYPE CABort</code>	<p>will always play completely before transitioning to the next step</p> <p>Sets the current step to be played continuously or until the trigger event of the next step is detected. When a trigger event is received, the waveform play will be aborted after the interval specified by the Duration Time parameter and it will then transition to the next step</p> <p>When Continuous Abort is selected, the Duration Time may be set using the second field under Step Duration and/or by the "Duration Time" on page 2899 command</p>

Duration Time

Allows you to specify the length of time the current step will play when "Step Duration" on page 2897 is Time.

When "Step Duration" on page 2897 is Continuous Abort, this parameter specifies the maximum duration that the waveform will continue to play after a step trigger is received before the transition to the next waveform will occur. Duration is limited to a maximum of 20 seconds.

If the Transition Time value is longer than the Step Duration Time, an error is generated when initiating a source list sequence. For source list sequence, transition time is included in the step duration length (not occupy additional time). If the Transition Time value is longer than the Step Duration Time, the real step duration length is extended to equal the transition time and cause a timing shift.

Remote Command	<code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:DURation:TCOunt <double></code> <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:DURation:TCOunt?</code>
Example	<code>:SOUR:LIST:STEP2:SET:DUR:TCO 1s</code> <code>:SOUR:LIST:STEP2:SET:DUR:TCO?</code>
Notes	<p>When Repetition is Single, the last step continues playing after the sequence is completed. In this extended playing time, <code>:STAT:OPER:COND?</code> returns 0 for the Source Sweeping Status Bit (bit 9)</p> <p>SCPI is supported after A.09.40</p> <p>If current Duration Type is Continuous, then error -221, "Settings conflict; Cannot accept time or count input when step duration type is Continuous on step #" is displayed</p>

Dependencies	Not available in E7760B
Preset	VXT models SP900B/11A/16A: 2.0 ms All others: 1.00 ms
Min	For VXT models SP900B/11A/16A, the minimum duration time for first step is 1.2 ms. If the Waveform is "waveform name", the minimum duration time is 1.2 ms All others: 100 µs
Max	1800 s

Play Count

Allows you to specify the number of times the current ARB waveform file will play during a step when **"Step Duration" on page 2897** is Count.

Remote Command	<code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:DURation:TCOunt <double></code> <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:DURation:TCOunt?</code>
Example	<code>:SOUR:LIST:STEP2:SET:DUR:TCO 10</code> <code>:SOUR:LIST:STEP2:SET:DUR:TCO?</code>
Notes	SCPI is supported after A.09.40 This command is reused by Play Count and Duration Time if Duration Type is set to Play Count or Duration Time If Duration Type is Continuous , then error -221, "Settings conflict; Cannot accept time or count input when step duration type is Continuous on step #" is displayed If Play Count is set for the last step, the last step of ARB keeps playing as if set to Continuous after play count setting is reached
Dependencies	Not available in E7760B
Preset	1
Min	1
Max	65536

Trig Out

Allows you to specify the trigger output for the current step. The trigger output signal is sent at the start of the step.

When this is **ON**, a trigger event occurs on both Internal and External2 paths. Selecting **OFF** turns off trigger output.

Remote Command	<code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:OUTPut:TRIGger ON OFF 1 0</code> <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:OUTPut:TRIGger?</code>
Example	<code>:SOUR:LIST:STEP2:SET:OUTP:TRIG ON</code> <code>:SOUR:LIST:STEP2:SET:OUTP:TRIG?</code>

Notes	SCPI is supported after A.09.40
Dependencies	Not available in E7760B
Preset	OFF
Range	ON OFF

Step Configuration (Remote Command Only)

Used to configure the List Sequencer, as detailed in the table below. The command is defined such that you send one command per step, with the step number being specified as a subopcode of the SCPI command. Each command includes all the parameter settings for the step. As a step is set up, the values entered are run through several levels of validation.

Remote Command	<pre>:SOURce:LIST:STEP[1] 2 ... 1000:SETup <step_trigger>, <trans_time>, <band>, <link_type>, <freq_chan>, <power>, <waveform>, <duration>, <time_count>, <trig_state></pre> <p>For details of each option, see "Step Configuration Parameters" on page 2901 below</p> <pre>:SOURce:LIST:STEP[1] 2 ... 1000:SETup?</pre>
Example	<pre>:SOUR:LIST:STEP1:SET INT, 1ms, PGSM, DOWN, 10, -25 dBm, "GSM_Test1.bin", TIME, 10ms, OFF</pre>
Dependencies	<p>The range of subopcode values is 1 to 1000, and the value you enter is determined by the number of steps you have configured. For details see "Number of Steps" on page 2886</p> <p>If you attempt to remotely set or query a subopcode that is out of range, an error is generated</p>

Step Configuration Parameters

There are 10 parameters for each step, which must be in the following order in the command:

1	Step Trigger <step_trigger>	Data Type: enum Specifies the input trigger for the step. For further details, see "Step Trigger" on page 2887
2	Transition Time <trans_time>	Data Type: enum Specifies the transition time for the step, in seconds. For further details, see "Transition Time" on page 2889
3	Radio Band <band>	Data Type: enum Specifies the radio band for the step, as any one of: NONE PGSM EGSM RGSM DCS1800 PCS1900 TGSM810 GSM450 GSM480 GSM700 GSM850 BANDI BANDII BANDIII BANDIV BANDV BANDVI BANDVII BANDVIII BANDIX BANDX BANDXI BANDXII BANDXIII

6 Input/Output
6.1 RF Source

| BANDXIV | BANDXIX | USCELL | USPCS | JAPAN
| KOREAN | NMT | IMT2K | UPPER | SECOND |

N260 | N261

4	Radio Band Link <link_type>	<p>For further details, see "Band" on page 2890</p> <p>Data Type: enum</p> <p>Specifies the radio band link direction for the step, as either of:</p> <p>DOWN UP</p> <p>For further details, see "Device" on page 2894</p> <p>The old Device BTS MS is obsolete, but is still supported, acting as an alias for the Link parameter</p>
5	Frequency/Channel Number <freq_chan>	<p>Data Type: freq/chan num</p> <p>Specifies the frequency in Hz or the channel number for the step. The channel number and frequency are combined as one parameter that represents the frequency or channel number depending on the radio band setting. If the radio band is set to NONE, this value is interpreted as a frequency value in Hz. If the radio band is set to a valid band, this value is interpreted as a channel number</p> <p>For further details, see "Freq/Chan" on page 2895</p>
6	Power <power>	<p>Data Type: ampl</p> <p>Specifies the output power for the step in dBm. For details of the valid ranges see "Power" on page 2896</p>
7	Waveform <waveform>	<p>Data Type: string</p> <p>Specifies the waveform for playback during the step. The step can output either a new ARB waveform, continue playback of the previous waveform, or output a CW tone. The options for specifying these are:</p> <p><filename> Plays the specified waveform from the start. The filename value is the name of the file within ARB</p>

		playback memory, it does not include the windows path to the file on the HDD. If you enter a filename for a waveform that does not reside within ARB playback memory, an error is generated
		CONT Continues playback of the ARB file from the previous step
		CW Outputs a CW tone
		OFF Disables RF output
		For further details, see "Waveform" on page 2896 and "Waveform File" on page 2897
8	Step Duration <duration>	Data Type: enum Specifies the duration of the step, as one of: TIME COUNT CONTInuous The duration can be specified to be either time, or play count of the ARB file associated with the step, or continuous. If Waveform is set to CW , this value cannot be set to Play Count and an error will be generated. If CONTInuous is selected, the following Time or Count value is ignored. For further details, see "Step Duration" on page 2897
9	Time or Count <time_count>	Data Type: time/int Specifies time duration in seconds, or play count of the ARB file associated with the step For further details, see "Play Count" on page 2900
10	Output Trigger <trig_state>	Data Type: boolean Specifies the output trigger state for the step, as one of: ON OFF 1 0 For further details, see "Trig Out" on page 2900
	–	

Step Configuration of Step Trigger parameter list (Remote Command Only)

Configures the “Step Trigger” parameter array of the whole List Sequencer at one time. The number of arrays is the same as the step number defined in ["Number of Steps" on page 2886](#). As a step is setup, the value entered runs through several levels of validation.

Remote Command	<code>:SOURce:LIST:SETup:INPut:TRIGger <enum>, <enum>, <enum>, ...</code> <code>:SOURce:LIST:SETup:INPut:TRIGger?</code>
Example	<code>:SOUR:LIST:SET:INP:TRIG IMM,INT,EXT2</code>

	<code>:SOUR:LIST:SET:INP:TRIG?</code>
Notes	<p>The command is to setup below parameter array of whole list sequence</p> <p>Step Trigger <enum> - specifies the input trigger for the step. For details of the valid types of step trigger see "Step Trigger" on page 2887</p> <p>If input parameter number exceeds the step number defined by "Number of Steps" on page 2886, then error -221 "Settings conflict; The number of input parameters is too large and is truncated to current list step number" is generated, and only those parameters whose index number falls in number of steps will be updated</p>
Dependencies	The range is 1 to 1000, which is determined by the number of steps you have configured. For details see "Number of Steps" on page 2886

Step Configuration of Transition Time parameter list (Remote Command Only)

Configures the "Transition Time" parameter array of the whole List Sequencer at once. The array size is the same as step number defined in ["Number of Steps" on page 2886](#). As a step is setup, the value entered runs through several levels of validation.

Remote Command	<code>:SOURce:LIST:SETup:TRANSition:TIME <time>, <time>, <time>, ...</code> <code>:SOURce:LIST:SETup:TRANSition:TIME?</code>
Example	<code>:SOUR:LIST:SET:TRAN:TIME 1ms,1ms,1ms</code> <code>:SOUR:LIST:SET:TRAN:TIME?</code>
Notes	<p>The command is to setup below parameter array of whole list sequence</p> <p>Transition Time <time> - specifies the transition time for the step in seconds. For details of the valid ranges for the transition time see "Transition Time" on page 2889</p> <p>If input parameter number exceeds the step number defined by "Number of Steps" on page 2886, then the error -221, "Settings conflict; The number of input parameters is too large and is truncated to current list step number" is generated, and only those parameters whose index number falls in number of steps will be updated</p>
Dependencies	The range is 1 to 1000 which is determined by the number of steps you have configured. For details see "Number of Steps" on page 2886

Step Configuration of Radio Band parameter list (Remote Command Only)

Configures the **Radio Band** parameter array of the whole List Sequencer at once. The size of the array is the same as the step number defined in ["Number of Steps" on page 2886](#). As a step is set up, the value entered runs through several levels of validation.

Remote Command	<code>:SOURce:LIST:SETup:RADio:BAND <enum>, <enum>, <enum>, ...</code> <code>:SOURce:LIST:SETup:RADio:BAND?</code>
Example	<code>:SOUR:LIST:SET:RAD:BAND PGSM, EGSM, RGSM</code>

	<code>:SOUR:LIST:SET:RAD:BAND?</code>
Notes	<p>The command sets up the parameter array of whole list sequence</p> <p>Radio Band <enum> - specifies the radio band for the step. For available options, see "Band" on page 2890</p> <p>If the input parameter number exceeds the step number defined by "Number of Steps" on page 2886, then error -221, "Settings conflict; The number of input parameters is too large and is truncated to current list step number" is generated, and only those parameters whose index number falls within the number of steps will be updated</p>
Dependencies	The range is 1 to 1000, which is determined by the number of steps you have configured. For details see "Number of Steps" on page 2886

Step Configuration of Radio Band Link parameter list (Remote Command Only)

Configures the **Radio Band Link** parameter array of the whole List Sequencer at one time. The number of arrays is same as step number defined in ["Number of Steps" on page 2886](#). As a step is set up, the value entered runs through several levels of validation.

Remote Command	<code>:SOURce:LIST:SETup:RADio:BAND:LINK <enum>, <enum>, <enum>, ...</code> <code>:SOURce:LIST:SETup:RADio:BAND:LINK?</code>
Example	<code>:SOUR:LIST:SET:RAD:BAND:LINK DOWN,UP,UP</code> <code>:SOUR:LIST:SET:RAD:BAND:LINK?</code>
Notes	<p>The command sets up the parameter array of whole list sequence</p> <p>Radio Band Link <enum> - specifies the radio band link direction for the step. Options are: <code>DOWN UP</code></p> <p>If input parameter number exceeds the step number defined by "Number of Steps" on page 2886, then error -221, "Settings conflict; The number of input parameters is too large and is truncated to current list step number" is generated, and only those parameters whose index number falls within the number of steps will be updated</p>
Dependencies	The range is 1 to 1000, which is determined by the number of steps you have configured. For details see "Number of Steps" on page 2886

Step Configuration of Frequency/Channel Number parameter list (Remote Command Only)

Configures the **Frequency** or **Channel Number** parameter array of the whole List Sequencer at one time. The number of arrays is same as step number defined in ["Number of Steps" on page 2886](#). As a step is set up, the value entered runs through several levels of validation.

Remote Command	<code>:SOURce:LIST:SETup:CNFRrequency <double>, <double>, <double>, ...</code> <code>:SOURce:LIST:SETup:CNFRrequency?</code>
----------------	---

Example	<pre>:SOUR:LIST:SET:CNFR 1GHz,100MHz,100MHz :SOUR:LIST:SET:CNFR? :SOUR:LIST:SET:CNFR 124,124,124 :SOUR:LIST:SET:CNFR?</pre>
Notes	<p>The command sets up the parameter array of whole list sequence</p> <p>Frequency/Channel Number <freq>/<chan num> - specifies the frequency in Hz or the channel number for the step. The channel number and frequency are combined as one parameter that represents the frequency or channel number depending on the radio band setting. If the radio band is set to NONE, this value is interpreted as a frequency value in Hz. If the radio band is set to a valid band, this value is interpreted as a channel number. For details of the valid ranges for frequency and channel numbers, see "Freq/Chan" on page 2895 and "Freq/Chan" on page 2895</p> <p>This command is used to setup/query channel number or frequency setting, according to current Radio Band setting of that step. If Radio Band is NONE, then it is frequency. If Radio Band is not NONE, then it is channel number</p> <p>If input parameter number exceeds the step number defined by "Number of Steps" on page 2886, then generate error -221, "Settings conflict; The number of input parameters is too large and is truncated to current list step number", and only those parameters whose index number falls in legal step number will be updated</p>
Dependencies	<p>The range is 1 to 1000, which is determined by the number of steps you have configured. For details see "Number of Steps" on page 2886</p>

Step Configuration of Power parameter list (Remote Command Only)

Configures the **Power** parameter array of the whole List Sequencer at one time. The number of arrays is the same as step number defined in ["Number of Steps" on page 2886](#). As a step is set up, the value entered runs through several levels of validation.

Remote Command	<pre>:SOURce:LIST:SETup:AMPLitude <ampl>, <ampl>, <ampl>, ... :SOURce:LIST:SETup:AMPLitude?</pre>
Example	<pre>:SOUR:LIST:SET:AMPL -50dBm, -40dBm, -30dBm :SOUR:LIST:SET:AMPL?</pre>
Notes	<p>The command sets up the parameter array of whole list sequence</p> <p>Power <ampl> - specifies the output power for the step in dBm. For details of the valid ranges, see "Power" on page 2896</p> <p>If input parameter number exceeds the step number defined by "Number of Steps" on page 2886, then error -221, "Settings conflict; The number of input parameters is too large and is truncated to current list step number" is generated, and only those parameters whose index number falls within legal step number will be updated</p>
Dependencies	<p>The range is 1 to 1000, which is determined by the number of steps you have configured. For details see "Number of Steps" on page 2886</p>

Step Configuration of Waveform parameter list (Remote Command Only)

Configures the **Waveform** parameter array of the whole List Sequencer at one time. The number of arrays is same as step number defined in ["Number of Steps" on page 2886](#). As a step is set up, the value entered runs through several levels of validation.

Remote Command	<code>:SOURCE:LIST:SETup:WAVEform <string>, <string>, <string>, ...</code> <code>:SOURCE:LIST:SETup:WAVEform?</code>								
Example	<code>:SOUR:LIST:SET:WAV "CW", "Off", "CONT"</code> <code>:SOUR:LIST:SET:WAV?</code>								
Notes	<p>Sets up or queries the parameter array of whole list sequence</p> <p>Waveform <string> - specifies the waveform for playback during the step. The step can output either a new ARB waveform, continue playback of the previous waveform, or output a CW tone. The options for specifying these are:</p> <table border="1"> <tr> <td><filename></td> <td>Plays the specified waveform from the start. The filename value is the name of the file within ARB playback memory, it does not include the windows path to the file on the HDD. If you enter a filename for a waveform that does not reside within ARB playback memory, an error is generated</td> </tr> <tr> <td>CONT</td> <td>Continues playback of the ARB file from the previous step</td> </tr> <tr> <td>CW</td> <td>Outputs a CW tone</td> </tr> <tr> <td>OFF</td> <td>Disables the RF output</td> </tr> </table> <p>If input parameter number exceeds the step number defined by "Number of Steps" on page 2886, then error -221, "Settings conflict; The number of input parameters is too large and is truncated to current list step number" is generated, and only those parameters whose index number falls within number of steps will be updated</p>	<filename>	Plays the specified waveform from the start. The filename value is the name of the file within ARB playback memory, it does not include the windows path to the file on the HDD. If you enter a filename for a waveform that does not reside within ARB playback memory, an error is generated	CONT	Continues playback of the ARB file from the previous step	CW	Outputs a CW tone	OFF	Disables the RF output
<filename>	Plays the specified waveform from the start. The filename value is the name of the file within ARB playback memory, it does not include the windows path to the file on the HDD. If you enter a filename for a waveform that does not reside within ARB playback memory, an error is generated								
CONT	Continues playback of the ARB file from the previous step								
CW	Outputs a CW tone								
OFF	Disables the RF output								
Dependencies	The range is 1 to 1000 which is determined by the number of steps you have configured. For details see "Number of Steps" on page 2886								
Range	<code>"filename" "CW" "Off" "CONT"</code>								

Step Configuration of Step Duration parameter list (Remote Command Only)

Configures the **Step Duration** parameter array of the whole List Sequencer at one time. The number of arrays is same as step number defined in ["Number of Steps" on page 2886](#). As a step is set up, the value entered runs through several levels of validation.

Remote Command	<code>:SOURCE:LIST:SETup:DURation:TYPE <enum>, <enum>, <enum>, ...</code> <code>:SOURCE:LIST:SETup:DURation:TYPE?</code>
Example	<code>:SOUR:LIST:SET:DUR:TYPE COUN,TIME,CONT</code>

<code>:SOUR:LIST:SET:DUR:TYPE?</code>	
Notes	<p>Sets up or queries the parameter array of whole list sequence</p> <p>Step Duration <code><enum></code> - specifies the duration of the step. The duration can be specified to be either time, or play count of the ARB file associated with the step, or continuous. If Waveform is set to "CW", this value cannot be set to Play Count and an error will be generated. If continuous is selected, the following Time or Count value is ignored. For further details of this setting, see "Step Duration" on page 2897</p> <p>Options are: <code>TIME COUNT CONTInuous</code></p> <p>If input parameter number exceeds the step number defined by "Number of Steps" on page 2886, then error -221, "Settings conflict; The number of input parameters is too large and is truncated to current list step number" is generated, and only those parameters whose index number falls within number of steps will be updated</p>
Dependencies	<p>The range is 1 to 1000, which is determined by the number of steps you have configured. For details see "Number of Steps" on page 2886</p>

Step Configuration of Duration Time or Play Count parameter list (Remote Command Only)

Configures the **Duration Time** or **Play Count** parameter array of the whole List Sequencer at one time. The number of arrays is same as step number defined in ["Number of Steps" on page 2886](#). As a step is set up, the value entered runs through several levels of validation.

Remote Command	<pre><code>:SOURce:LIST:SETup:TOCount <time/int>, <time/int>, <time/int>, ... :SOURce:LIST:SETup:TOCount?</code></pre>
Example	<pre><code>:SOUR:LIST:SET:TOC 1s,2s,3s :SOUR:LIST:SET:TOC? :SOUR:LIST:SET:TOC 5,6,7 :SOUR:LIST:SET:TOC?</code></pre>
Notes	<p>Sets up or queries the parameter array of whole list sequence</p> <p>Time or Count <code><time/int></code> - specifies time duration in seconds or play count of the ARB file associated with the step</p> <p>If input parameter number exceeds the step number defined by "Number of Steps" on page 2886, then an error is generated, and only those parameters whose index number falls within number of steps will be updated</p> <p>If current "Step Duration" on page 2897 is "Continuous", then error -221, "Settings conflict; Cannot accept time or count input when step duration type is Continuous on step #" is generated</p>
Dependencies	<p>The range is 1 to 1000, which is determined by the number of steps you have configured. For details see "Number of Steps" on page 2886</p>

Step Configuration of Output Trigger parameter list (Remote Command Only)

Configures the **Output Trigger** parameter array of the whole List Sequencer at one time. The number of arrays is same as step number defined in "[Number of Steps](#)" on [page 2886](#). As a step is set up, the value entered runs through several levels of validation.

Remote Command	<code>:SOURCE:LIST:SETup:OUTPut:TRIGger <bool>, <bool>, <bool>, ...</code> <code>:SOURCE:LIST:SETup:OUTPut:TRIGger?</code>
Example	<code>:SOUR:LIST:SET:OUTP:TRIG ON,OFF,ON</code> <code>:SOUR:LIST:SET:OUTP:TRIG?</code>
Notes	Sets up or queries the parameter array of whole list sequence Output Trigger <Boolean> - specifies the output trigger for the step. Options are: <code>ON OFF 1 0</code> If input parameter number exceeds the step number defined by " Number of Steps " on page 2886 , then error -221, "Settings conflict; The number of input parameters is too large and is truncated to current list step number" is generated, and only those parameters whose index number falls within legal step number are updated
Dependencies	The range is 1 to 1000, which is determined by the number of steps you have configured. For details see " Number of Steps " on page 2886

Clear List (Remote Command Only)

The SCPI equivalent of the Clear List UI feature described in "[Clear List](#)" on [page 2887](#).

Remote Command	<code>:SOURCE:LIST:SETup:CLEar</code>
Example	<code>:SOUR:LIST:SETup:CLE</code>
Dependencies	Not available in E7760B

6.1.8.8 Remote Software Trigger (Remote command Only)

During execution of a list sequence, the sequence halts and waits at any step that has Step Trigger set to "Bus". Sending this command triggers the step and continues the sequence.

Remote Command	<code>:SOURCE:LIST:TRIGger:INITiate[:IMMediate]</code>
Example	<code>:SOUR:LIST:TRIG:INIT</code>
Dependencies	Not available in E7760B

6.1.8.9 Query List Sequence Initiation Armed Status (Remote Query Only)

This is a blocking SCPI query to determine whether a source list sequence has been initiated successfully.

Remote Command	<code>:SOURce:LIST:INITiation:ARMed?</code>
Example	<code>:SOUR:LIST:INIT:ARMed?</code>
Notes	<p>Returns "1" if list sequence has been initiated successfully, or "0" if not. If the response is "0", use <code>:SYST:ERR?</code> to query the actual error</p> <p>Like <code>*OPC?</code>, this command can be blocked until event/status "IsSourceSweeping" occurs, and then returns. Doing so can help a script query the armed status only once during the time interval of the initiation. As an ancillary to the existing <code>:SOUR:LIST:TRIGger[:IMMediate]</code> (see "Initiate Sequence" on page 2884), send this query after <code>:SOUR:LIST:TRIG</code>. Otherwise, this query will return "1" immediately</p> <p>The return data is in the following format: Integer</p> <p>There is an alias: <code>:SOURce:LIST:TRIGger:INITiation:ARMed?</code></p>
Dependencies	Not available in E7760B

6.1.9 Frequency Setup

Allows you to access the Frequency Setup sub-menu panel.

Notes	The menu under this control is for independent mode and has no effect on the "List Sequencer" on page 2883. If "Sequencer" on page 2884 is ON, the List Sequencer controls the source output and this key is grayed-out, to indicate out-of-scope. When "Sequencer" on page 2884 is OFF, source leaves List Sequencer and this button is blanked out
-------	--

6.1.9.1 Frequency

Allows you to set the RF Output Frequency. You can adjust the frequency of the source using the numeric keypad, step keys, or RPG. Pressing any digit (0 through 9) on the numeric keypad displays the unit terminator.

Remote Command	<code>:SOURce:FREQuency[:CW] <freq></code> <code>:SOURce:FREQuency[:CW]?</code>
Example	<code>:SOUR:FREQ 1.00 GHz</code>
Notes	Internal source has list sequence mode, which comprises of several steps that contain separate output power, frequency and waveform etc. When the source list sequence playing is complete, the last step keeps playing, and you can use this command to change the list sequence last step's output frequency
Couplings	The frequency value is coupled to the current channel band and number, such that updates to the band and number will update the frequency value to the corresponding absolute frequency

Preset	E7760B	Depends on port selected
	EXM, with license F1A or 5WC	2.412 GHz
	VXT Models with Radio Heads/CIU	See "VXT Models with Radio Heads/CIU" on page 2912
	All other models	1.00 GHz

Min	E7760B	Depends on port selected
	VXT model SP900B	60 MHz
	VXT models SP900B/11A/15A/16A	380 MHz
	VXT model SP900Bwith Option LFE	1 MHz
	VXT Models with Radio Heads/CIU	See "VXT Models with Radio Heads/CIU" on page 2912
	All other models	10.00 MHz

Max	Hardware Dependent:	
	Option 503	3.6 GHz
	Option 504	3.8 GHz
	Option 506	6.00 GHz
	Option F06	6.00 GHz

See ["VXT models SP900B/16A"](#)

For VXT Models with Radio Heads/CIU: see ["VXT Models with Radio Heads/CIU" on page 2912](#)

For E7760B: Depends on port selected

For EXM, if license 5WC is present, the frequency range should be limited to: 1.1GHz-1.7GHz, 2.4GHz-2.5GHz, 4.8GHz-6.0GHz. If the user-defined frequency is outside of range, reports error message "Settings conflict; Frequency is outside available range"

VXT models SP900B/11A

RF Output Port	Preset	Min Without Option "LFE"	Min With Option "LFE"	Max
RF Output	1 GHz	380 MHz	1 MHz	6 GHz
RFHD	1 GHz	380 MHz	1 MHz	6 GHz

VXT models SP900B/16A

Freq Option	Preset	Min	Max
F06	1 GHz	380 MHz	6.0 GHz
F08	1 GHz	380 MHz	8.0 GHz
F12	1 GHz	380 MHz	12.3 GHz

E7760B

RF Output Port	Preset	Min	Max
IFIO	16 GHz	2 GHz	18 GHz
M1650A	58.32 GHz	55 GHz	69 GHz
M1720A	28 GHz	25 GHz	29 GHz

VXT Models with Radio Heads/CIU

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
SP900B+ CIU	6 GHz	5.9 GHz	12 GHz
SP900B+ CIU + RRH	28 GHz	24.25 GHz	43.5 GHz

6.1.9.2 Channel

The frequency of the source can be specified by a channel number of a given frequency band. This control allows you to specify the current channel number. For the appropriate range of channel numbers for a given frequency band, see the following tables: ["GSM/EDGE Channel Number Ranges" on page 2912](#), ["W-CDMA Channel Number Ranges" on page 2913](#), ["CDMA 2000 / 1xEVDO Channel Number Ranges" on page 2915](#), and ["LTE FDD Channel Number Ranges" on page 2917](#).

Channel is not available on E7760B.

Remote Command	<code>:SOURce:FREQuency:CHANnels:NUMBer <int></code> <code>:SOURce:FREQuency:CHANnels:NUMBer?</code>
Example	<code>:SOUR:LIST:STEP2:SET:RAD:NUMB 1</code>
Notes	Grayed-out when the "Radio Standard/Radio Band" on page 2922 is set to NONE
Couplings	The channel number is coupled to the frequency value when "Radio Standard/Radio Band" on page 2922 is not set to NONE When the frequency value is changed, the channel number increases or decreases to match the new frequency. If the frequency is not at an exact match for a channel number, the nearest channel number is displayed, with > or < indicating whether the frequency is above or below the channel number
Preset	1
Min/Max	See the tables below for the valid ranges

GSM/EDGE Channel Number Ranges

Band	Link (Device)	Range	Frequency (MHz)
P-GSM	Uplink (MS)	1 £ n £ 124	890.0 + 0.2*n

LTE FDD Channel Number Ranges

The carrier frequency in the uplink and downlink is designated by the E-UTRA Absolute Radio Frequency Channel Number (EARFCN) in the range 0 - 65535. The relation between EARFCN and the carrier frequency in MHz for the downlink is given by the following equation, where F_{DL_low} and $N_{Offs-DL}$ are given in table 5.4.4-1 and N_{DL} is the downlink EARFCN.

$$F_{DL} = F_{DL_low} + 0.1(N_{DL} - N_{Offs-DL})$$

The relation between EARFCN and the carrier frequency in MHz for the uplink is given by the following equation where F_{UL_low} and $N_{Offs-UL}$ are given in table 5.4.4-1 and N_{UL} is the uplink EARFCN.

$$F_{UL} = F_{UL_low} + 0.1(N_{UL} - N_{Offs-UL})$$

Band	Downlink			Uplink		
	F_{DL_low} (MHz)	$N_{Offs-DL}$	Range of N_{DL}	F_{UL_low} (MHz)	$N_{Offs-UL}$	Range of N_{UL}

Note: The channel numbers that designate carrier frequencies so close to the operating band edges that the carrier extends beyond the operating band edge shall not be used. This implies that the first 7, 15, 25, 50, 75 and 100 channel numbers at the lower operating band edge and the last 6, 14, 24, 49, 74 and 99 channel numbers at the upper operating band edge shall not be used for channel bandwidths of 1.4, 3, 5, 10, 15 and 20 MHz respectively.

LTE TDD Channel Number Ranges

The carrier frequency in the uplink and downlink is designated by the E-UTRA Absolute Radio Frequency Channel Number (EARFCN) in the range 0 - 65535. The relation between EARFCN and the carrier frequency in MHz for the downlink is given by the following equation, where F_{DL_low} and N_{Offs-DL} are given in table 5.4.4-1 and N_{DL} is the downlink EARFCN.

$$F_{DL} = F_{DL_low} + 0.1(N_{DL} - N_{Offs-DL})$$

The relation between EARFCN and the carrier frequency in MHz for the uplink is given by the following equation where F_{UL_low} and N_{Offs-UL} are given in table 5.4.4-1 and N_{UL} is the uplink EARFCN.

$$F_{UL} = F_{UL_low} + 0.1(N_{UL} - N_{Offs-UL})$$

Band	Downlink			Uplink		
	F _{DL_low} (MHz)	N _{Offs-DL}	Range of N _{DL}	F _{UL_low} (MHz)	N _{Offs-UL}	Range of N _{UL}

43	3600	43590	43590 – 45589	3600	43590	43590 – 45589

Note: The channel numbers that designate carrier frequencies so close to the operating band edges that the carrier extends beyond the operating band edge shall not be used. This implies that the first 7, 15, 25, 50, 75 and 100 channel numbers at the lower operating band edge and the last 6, 14, 24, 49, 74 and 99 channel numbers at the upper operating band edge shall not be used for channel bandwidths of 1.4, 3, 5, 10, 15 and 20 MHz respectively.

TDSCDMA Channel Number Ranges

1.28 Mcps TDD Option

No TX–RX frequency separation is required as Time Division Duplex (TDD) is employed. Each subframe consists of 7 main timeslots where all main timeslots (at

least the first one) before the single switching point are allocated DL and all main timeslots (at least the last one) after the single switching point are allocated UL.

The nominal channel spacing is 1.6 MHz, but this can be adjusted to optimize performance in a particular deployment scenario.

The carrier frequency is designated by the UTRA absolute radio frequency channel number (UARFCN). The value of the UARFCN in the IMT2000 band is defined in the general case as follows:

$$N_t = 5 * F \quad 0.0 \text{ MHz } \leq F \leq 3276.6 \text{ MHz}$$

where F is the carrier frequency in MHz

Additional channels applicable to operation in the frequency band defined in sub-clause 5.2(d) are defined via the following UARFCN definition:

$$N_t = 5 * (F - 2150.1 \text{ MHz}) \quad 2572.5 \text{ MHz } \leq F \leq 2617.5 \text{ MHz}$$

UARFCN

1.28 Mcps TDD Option

The following UARFCN range shall be supported for each band:

Frequency Band	Frequency Range	UARFCN Uplink and Downlink transmission
For operation in frequency band as defined in subclause 5.2 (a)	1900-1920 MHz	9504 to 9596
	2010-2025 MHz	10054 to 10121
For operation in frequency band as defined in subclause 5.2 (b)	1850-1910 MHz	9254 to 9546
	1930-1990 MHz	9654 to 9946
For operation in frequency band as defined in subclause 5.2 (c)	1910-1930 MHz	9554 to 9646
For operation in frequency band as defined in subclause 5.2 (d)	2570-2620 MHz	12854 to 13096
For operation in frequency band as defined in subclause 5.2 (e)	2300-2400 MHz	11504 to 11996
For operation in frequency band as defined in subclause 5.2 (f)	1880-1920 MHz	9404 to 9596

6.1.9.3 Radio Setup

Allows you to select the radio standard and associated radio band. You can also set the Radio Band Link to Uplink or Downlink.

Radio Standard/Radio Band

Allows you to select the radio standard and associated radio band. The first column in the dialog lets you set the Radio Standard; for each standard, and the second column in the dialog changes to show you the available bands.

Once you have selected the radio standard, you can then set an active channel band. The radio standard and the active channel band allow you to use the ["Channel" on page 2912](#) control to set Channel numbers, thus setting ["Frequency" on page 2910](#) automatically.

```

Radio Band Link

Allows you to specify the channel band type as either uplink or downlink link direction. This value is used in conjunction with the channel band and channel number to determine the absolute frequency output by the source.

- When set to **Uplink (UP)**, the source calculates the uplink frequency using an uplink formula together with the selected channel band and channel number
- When set to **Downlink (DOWN)** the source calculates the downlink frequency using a downlink formula together with the selected channel band and channel number

Remote Command	:SOURce:RADio:BAND:LINK DOWN UP :SOURce:RADio:BAND:LINK?
Example	:SOUR:RAD:BAND:LINK UP
Preset	DOWN
Range	DOWN UP
Backwards Compatibility SCPI	:SOURce:RADio:DEVIce BTS MS :SOURce:RADio:DEVIce?
Backwards Compatibility Notes	DOWN = BTS UP = MS

6.1.9.4 Set Reference Frequency

Allows you to set the frequency reference. Pressing this control turns the frequency reference state to **ON**, sets the reference frequency value to the current frequency, maintains this frequency at the RF output, and sets the displayed frequency to 0.00 Hz. All subsequent frequencies entered under Source>Frequency>Frequency are interpreted as being relative to this reference frequency.

When you use a frequency reference, the signal generator outputs a frequency that is set relative to the reference frequency by the value entered under **Source, Frequency, Frequency** as follows:

Output frequency = reference frequency - entered frequency

Where:

- reference frequency equals the original RF frequency entered under Source>Frequency>Frequency and set as the reference frequency
- entered frequency equals a new value entered under **Source, Frequency, Frequency**

In addition, the displayed frequency value will be the same as the value entered under Source>Frequency>Frequency.

NOTE

If Freq Reference is **ON** with a reference value set, entering a value under **Source, Frequency, Frequency** and pressing **Set Frequency Reference** adds that value to the existing Freq Reference value.

If you wish to change the reference frequency value to the new value entered under **Source, Frequency, Frequency**, first set Freq Reference **OFF** then press **Set Frequency Reference**.

Remote Command	<code>:SOURce:FREQuency:REFerence:SET</code>
Example	<code>:SOUR:FREQ:REF:SET</code>
Dependencies	Unavailable, and grayed-out, when List Sequencer is ON

6.1.9.5 Freq Reference

Allows you to toggle the state of the frequency reference. When the frequency reference state is **ON**, an annunciator is displayed on the main source view to indicate this state to the user.

When you use a frequency reference, the signal generator outputs a frequency that is set relative to the reference frequency by the value entered under **Source, Frequency, Frequency** as follows:

Output frequency = reference frequency + entered frequency

Where:

- reference frequency equals the original RF frequency entered under **Source, Frequency, Frequency** and set as the reference frequency
- entered frequency equals a new value entered under **Source, Frequency, Frequency**

For more information on Reference Frequency, see ["Set Reference Frequency" on page 2927](#).

Remote Command	<code>:SOURce:FREQuency:REFerence <freq></code> <code>:SOURce:FREQuency:REFerence?</code> <code>:SOURce:FREQuency:REFerence:STATe OFF ON 0 1</code>
----------------	---

	<code>:SOURce:FREQuency:REFerence:STATe?</code>						
Example	<code>:SOUR:FREQ:REF 0.00 Hz</code> <code>:SOUR:FREQ:REF:STATe ON</code>						
Dependencies	Unavailable, and grayed-out, when List Sequencer is ON						
Couplings	The frequency reference state is coupled to the frequency reference set immediate action. When the reference set immediate action key is pressed, or the SCPI command issued, it turns the frequency reference state ON						
Preset	0.00 Hz OFF						
Min	0.00 Hz						
Max	Hardware Dependent: <table border="1" data-bbox="407 741 1409 869"> <tr> <td>Option 503</td> <td>3.6 GHz</td> </tr> <tr> <td>Option 504</td> <td>3.8 GHz</td> </tr> <tr> <td>Option 506</td> <td>6.00 GHz</td> </tr> </table> <p>For E7760B: Dependent on port selected</p>	Option 503	3.6 GHz	Option 504	3.8 GHz	Option 506	6.00 GHz
Option 503	3.6 GHz						
Option 504	3.8 GHz						
Option 506	6.00 GHz						

6.1.9.6 Freq Offset

Allows you to specify the frequency offset value. When the frequency offset state is **ON**, an annunciator is displayed on the main source view to indicate this state to the user.

When the frequency offset is set to zero (0) and you set a new offset value, the displayed frequency value changes as follows and the RF output frequency does not change:

Displayed value = output frequency + offset value

Where:

- output frequency equals the original frequency entered under **Source, Frequency, Frequency**
- offset value equals the value entered under **Source, Frequency, Freq Offset**

When the frequency offset is set to a value other than zero (0) and you enter a new frequency value under **Source, Frequency, Frequency**, the displayed frequency will be the same as the value entered and the RF output frequency will be equal to the value entered minus the offset value as follows:

Output frequency = entered frequency – offset frequency

Displayed frequency = output frequency + offset frequency

Displayed frequency = entered frequency

6.1.9.8 Rx/Tx Coupling

Allows coupling between the frequency of the Internal Source, RF Output Frequency, and the instrument Center Frequency. For all settings except **NONE**, this parameter couples the **Center Frequency** of the instrument to the RF Output Frequency of the source. Valid setting changes result in the Analyzer CF and RF Output Frequency parameters being set to the same value, plus the "Rx/Tx Offset" on page 2931.

The four states for coupling are:

SOURce	Source follows Analyzer Coupling is in one direction only. Changes to the Center Frequency will result in the RF Output Frequency being set to the same value, with any Rx/Tx Frequency Offset applied. Changes to the RF Output Frequency will not change the Center Frequency and will change Rx/Tx Frequency Coupling to None
ANALyzer	Analyzer follows Source Coupling is in one direction only. Changes to the RF Output Frequency will result in the Center Frequency being set to the same value, with any Rx/Tx Frequency Offset applied. Changes to the Center Frequency will not change the RF Output Frequency and will change Rx/Tx Frequency Coupling to None
BOTH	Analyzer/Source Coupled Coupling is bi-directional. Changes to the Center Frequency will result in the RF Output Frequency being set to the same value, with any Rx/Tx Frequency Offset applied. Changes to the RF Output Frequency will result in the Center Frequency being set to the same value, with any Rx/Tx Frequency Offset applied
NONE	None RF Output Frequency and CF Frequency are independently controlled

Remote Command	<code>:SOURce:FREQuency:COUPling NONE BOTH SOURce ANALyzer</code> <code>:SOURce:FREQuency:COUPling?</code>
Example	<code>:SOUR:FREQ:COUP BOTH</code>
Dependencies	Only appears in Radio Test Mode
Preset	NONE Input/Output Preset
State Saved	Yes

6.1.9.9 Rx/Tx Offset

Allows you to offset the RF Output Frequency of the source from the **Center Frequency** of the instrument. See "Rx/Tx Coupling" on page 2931 for coupling behavior.

6 Input/Output
6.1 RF Source

Remote Command	<code>:SOURce:FREQuency:COUPling:OFFSet <freq></code> <code>:SOURce:FREQuency:COUPling:OFFSet?</code>						
Example	<code>:SOUR:FREQ:COUP:OFF 100 kHz</code>						
Dependencies	Grayed-out when " Rx/Tx Coupling " on page 2931 is set to NONE . If the grayed-out control is selected, the following message appears: "The parameter cannot be changed when Rx/Tx Coupling is Off" Only appears in Radio Test Mode						
Preset	0 Hz (Input/Output Preset)						
Min	-6 GHz						
Max	Hardware Dependent: <table border="1" data-bbox="406 709 1404 840"> <tr> <td>Option 503</td> <td>3.6 GHz</td> </tr> <tr> <td>Option 504</td> <td>3.8 GHz</td> </tr> <tr> <td>Option 506</td> <td>6.00 GHz</td> </tr> </table> For E7760B: Dependent on port selected For E6640A, if license 5WC is present, the frequency range should be limited to: 1.1GHz-1.7GHz, 2.4GHz-2.5GHz, 4.8GHz-6.0GHz. If the user-defined frequency is outside of range, UI reports an error message: "Settings conflict; Frequency is outside available range"	Option 503	3.6 GHz	Option 504	3.8 GHz	Option 506	6.00 GHz
Option 503	3.6 GHz						
Option 504	3.8 GHz						
Option 506	6.00 GHz						

6.1.10 Modulation

Allows you to toggle the state of the modulation.

Remote Command	<code>:OUTPut:MODUlation[:STATe] ON OFF 1 0</code> <code>:OUTPut:MODUlation[:STATe]?</code>
Example	<code>:OUTP:MOD OFF</code>
Notes	This setting is for independent mode and has no effect on the " List Sequencer " on page 2883. If Sequencer is ON , the List Sequencer controls the source output, and this key is grayed-out When Sequencer is OFF , source leaves List Sequencer, and this setting is blanked out, taking effect immediately When Modulation is ON , the "MOD" annunciator is displayed in the system settings panel. When Modulation is OFF , the "MOD" annunciator is cleared If Sequencer is ON , the "MOD" annunciator will be replaced by "SEQ" in the system settings panel, indicating that the output is controlled by List Sequencer
Preset	OFF
Range	ON OFF

6.1.11 Modulation Setup

Allows access to the menus for setting up the available modulation types.

This control is not available in E7760B.

AM/FM/PM are not available for VXT models SP900B/16A.

6.1.11.1 AM

Enables or disables the amplitude modulation.

Turning **AMON** when another modulation format is already on results in the previous modulation format being turned off, and generates an error.

Remote Command	<code>:SOURCE:AM:STATE ON OFF 1 0</code> <code>:SOURCE:AM:STATE?</code>
Example	<code>:SOUR:AM:STAT OFF</code>
Dependencies	Not available in E7760B
Preset	<code>OFF</code>
Range	<code>ON OFF</code>

6.1.11.2 AM Mod Depth

Allows you to set the amplitude modulation depth in percent.

Remote Command	<code>:SOURCE:AM[:DEPTH][:LINEar] <real></code> <code>:SOURCE:AM[:DEPTH][:LINEar]?</code>
Example	<code>:SOUR:AM 0.1</code>
Dependencies	Not available in E7760B
Preset	0.1 %
Min	0.1 %
Max	95.0 %

6.1.11.3 AM Rate

Allows you to set the internal amplitude modulation rate.

Remote Command	<code>:SOURCE:AM:INTERNAL:FREQUENCY <freq></code> <code>:SOURCE:AM:INTERNAL:FREQUENCY?</code>
Example	<code>:SOUR:AM:INT:FREQ 40.0 Hz</code>
Dependencies	Not available in E7760B
Preset	400.0 Hz
Min	10 Hz
Max	40 kHz

6.1.11.4 AM Rate Increment

Changes the step size for "AM Rate" on page 2933. Once an increment size has been selected and **AM Rate** is active, the step keys (and the **UP | DOWN** parameters for **AM Rate** from remote commands) change **AM Rate** by the increment value.

Remote Command	<code>:SOURce:AM:INTernal:FREQuency:STEP[:INCRement] <freq></code> <code>:SOURce:AM:INTernal:FREQuency:STEP[:INCRement]?</code>
Example	<code>:SOUR:AM:INT:FREQ:STEP 100 Hz</code> <code>:SOUR:AM:INT:FREQ:STEP?</code>
Couplings	Coupled to the increment size of AM Rate
Preset	10 Hz
State Saved	Yes
Min	1 Hz
Max	40 kHz

6.1.11.5 FM

Enables or disables the frequency modulation.

Turning **FMON** when another modulation format is already on results in the previous modulation format being turned off and the generation of an error.

Remote Command	<code>:SOURce:FM:STATe ON OFF 1 0</code> <code>:SOURce:FM:STATe?</code>
Example	<code>:SOUR:FM:STAT OFF</code>
Dependencies	Not available in E7760B
Preset	OFF
Range	ON OFF

6.1.11.6 FM Deviation

Allows you to set the frequency modulation deviation.

Remote Command	<code>:SOURce:FM[:DEViation] <freq></code> <code>:SOURce:FM[:DEViation]?</code>
Example	<code>:SOUR:FM 1.00 kHz</code>
Dependencies	Not available in E7760B
Preset	1.00 Hz

Min	1.00 Hz
Max	100.00 kHz

6.1.11.7 FM Rate

Allows you to set the internal frequency modulation rate.

Remote Command	<code>:SOURce:FM:INTernal:FREQuency <freq></code> <code>:SOURce:FM:INTernal:FREQuency?</code>
Example	<code>:SOUR:FM:INT:FREQ 40.0 Hz</code>
Dependencies	Not available in E7760B
Preset	400.0 Hz
Min	10 Hz
Max	40 kHz

6.1.11.8 FM Rate Increment

FM Rate Increment changes the step size for "FM Rate" on page 2935. Once an increment size has been selected and **FM Rate** is active, the step keys (and the **UP | DOWN** parameters for **FM Rate** from remote commands) change **FM Rate** by the increment value.

Remote Command	<code>:SOURce:FM:INTernal:FREQuency:STEP[:INCRement] <freq></code> <code>:SOURce:FM:INTernal:FREQuency:STEP[:INCRement]?</code>
Example	<code>:SOUR:FM:INT:FREQ:STEP 100 Hz</code> <code>:SOUR:FM:INT:FREQ:STEP?</code>
Couplings	Coupled to the increment size of FM Rate
Preset	10 Hz
State Saved	Yes
Min	1 Hz
Max	40 kHz

6.1.11.9 PM

Enables or disables the phase modulation.

Turning **PMON** when another modulation format is already on results in the previous modulation format being turned **OFF** and the generation of an error.

Remote Command	<code>:SOURce:PM:STATe ON OFF 1 0</code>
----------------	--

	<code>:SOURce:PM:STATe?</code>
Example	<code>:SOUR:PM:STAT OFF</code>
Dependencies	Not available in E7760B
Preset	<code>OFF</code>
Range	<code>ON OFF</code>

6.1.11.10 PM Deviation

Allows you to set the phase modulation deviation in radian.

Remote Command	<code>:SOURce:PM[:DEVIation] <real></code> <code>:SOURce:PM[:DEVIation]?</code>
Example	<code>:SOUR:PM 1.00</code>
Dependencies	Not available in E7760B
Preset	0.1 rad
Min	0.1 rad
Max	20.0 rad

6.1.11.11 PM Rate

Allows you to set the internal phase modulation rate.

Remote Command	<code>:SOURce:PM:INTernal:FREQuency <freq></code> <code>:SOURce:PM:INTernal:FREQuency?</code>
Example	<code>:SOUR:PM:INT:FREQ 40.0 Hz</code>
Dependencies	Not available in E7760B
Preset	400.0 Hz
Min	10 Hz
Max	40 kHz

6.1.11.12 PM Rate Increment

Changes the step size for "PM Rate" on page 2936. Once an increment size has been selected and **PM Rate** is active, the step keys (and the **UP | DOWN** parameters for **PM Rate** from remote commands) change **PM Rate** by the increment value.

Remote Command	<code>:SOURce:PM:INTernal:FREQuency:STEP[:INCRement] <freq></code> <code>:SOURce:PM:INTernal:FREQuency:STEP[:INCRement]?</code>
Example	<code>:SOUR:PM:INT:FREQ:STEP 100 Hz</code>

	<code>:SOUR:PM:INT:FREQ:STEP?</code>
Couplings	Coupled to the increment size of PM Rate
Preset	10 Hz
State Saved	Yes
Min	1 Hz
Max	40 kHz

6.1.11.13 ARB Setup

Accesses menus for setting up the Arbitrary Waveform Generator.

Basic Control

Lets you set up the basic ARB parameters and select a waveform to play.

ARB State

Allows you to toggle the state of the ARB function. When the ARB is **ON**, a “MOD” annunciator is displayed in the system settings panel. When the ARB is **OFF**, the MOD annunciator is cleared

Remote Command	<code>:SOURce:RADio:ARB[:STATe] ON OFF 1 0</code> <code>:SOURce:RADio:ARB[:STATe]?</code>
Example	<code>:SOUR:RAD:ARB OFF</code> <code>:SOUR:RAD:ARB?</code>
Notes	If ARB is ON , and you then load or delete another file to ARB memory, the playing waveform segment may not keep phase continuity during the ARB memory operation. The waveform will be replayed after the ARB operation is finished
Dependencies	This setting is for the independent mode and has no effect on the " List Sequencer " on page 2883. If Sequencer is ON , this will make the source enter List Sequencer mode, and even if ARB state is ON , the ARB file will not be played. When Sequencer is OFF , source leaves List Sequencer and this setting takes effect immediately The ARB can only be turned on when there is a waveform file selected for playback. On the GUI, if no waveform is selected, this key is grayed out. If you send the SCPI command to turn the ARB on with no waveform selected for playback, the ARB state remains OFF and an error is generated -When you try to recall a certain set of states in which the selected waveform is not in ARB memory and the ARB state is ON , errors are reported
Preset	OFF
Range	ON OFF

Sample Rate

Allows you to set the ARB waveform playback sample rate.

See ["More Information" on page 2939](#)

Remote Command	<code>:SOURce:RADio:ARB:SCLock:RATE <freq></code>		
	<code>:SOURce:RADio:ARB:SCLock:RATE?</code>		
Example	<code>:SOUR:RAD:ARB:SCL:RATE 48.00 MHz</code>		
Notes	<p>If there is a sample rate specified in the header of the waveform file, changing that sample rate is not recommended, as it may cause problems with burst timing</p> <p>For E7760B, the Sample Rate is fixed. If this control is attempted to be set the error -221, "Settings conflict; Sample Rate is fixed" is generated</p>		
Dependencies	<p>When a new waveform is selected for playback the settings contained within the associated waveform header file are applied to the ARB. The sample rate is one of the values stored within the header file. If the newly selected waveform file has an associated header file, the sample rate is updated with the value from the header file. The sample rate will remain unchanged if the newly selected waveform does not have an associated header file</p>		
Preset	E7760B	2.64 GHz	
	Option B40	50 MHz	
	Option B85	100 MHz	
	Option B1X	200 MHz	
	Option B3X	375 MHz	
	Option B6X	750 MHz	
	Option B4X	500 MHz	
	Option B8X	1.0 GHz	
	Option B12	1.5 GHz	
Min	E7760B: 2.64 GHz		
	All Others: 1.00 kHz		
Max	Hardware Dependent:		
	E7760B	2.64 GHz	
	VXT model SP900B	Option B40	50 MHz
		Option B85	100 MHz
		Option B1X	200 MHz

VXT models SP900B/11A	Option B40	50 MHz
	Option B3X	375 MHz
	Option B6X	750 MHz
	Option B12	1.5 GHz
VXT models SP900B/16A	Option B4X	500 MHz
	Option B8X	1.0 GHz
	Option B12	1.5 GHz

For VXT models SP900B/11A/15A/16A and SP900B/81A, the sample rate is only limited by the option ,but the IF BW is limited by center frequency in addition to options. See ["More Information" on page 2939](#). Performance is guaranteed only when the bandwidth of the selected waveform is smaller than the Max IF BW

More Information

Although the range of Sample Rate only depends on the installed option, the Maximum IF BW depends on options as well as the Center Frequency.

VXT models SP900B/11A, SP900Band SP900B

Option Limitation:

Option	Maximum IF BW
B40	40 MHz
B3X	300 MHz
B6X	600 MHz
B12	1200 MHz

Center Frequency Limitation:

Center Frequency	Maximum IF BW
6.5 kHz ~ 9 kHz (Option LFE)	(CF – 6.5 kHz) * 2
9 kHz ~ 100 kHz (Option LFE)	5 kHz
100 kHz ~ 1 MHz (Option LFE)	50 kHz
1 MHz ~ 10 MHz (Option LFE)	500 kHz
10 MHz ~ 20 MHz (Option LFE)	5 MHz
20 MHz ~ 60 MHz (Option LFE)	10 MHz
60 MHz ~ 80 MHz (Option LFE)	20 MHz
80 MHz ~ 380 MHz (Option LFE)	40 MHz
330 MHz ~ 380 MHz (without Option LFE)	(CF – 330 MHz) * 2

6 Input/Output
6.1 RF Source

Center Frequency	Maximum IF BW
380 MHz ~ 550 MHz	100 MHz
550 MHz ~ 1310 MHz	200 MHz
1310 MHz ~ 2000 MHz (without Option EP6)	600 MHz
2000 MHz ~ 5480 MHz (without Option EP6)	1200 MHz
5480 MHz ~ 6080 MHz (without Option EP6)	$(6080 \text{ MHz} - \text{CF}) * 2$
1310 MHz ~ 1900 MHz (Option EP6)	600 MHz
1900 MHz ~ 6000 MHz (Option EP6)	1200 MHz
6000 MHz ~ 6600 MHz (Option EP6)	$(6600 \text{ MHz} - \text{CF}) * 2$

VXT models SP900B/16A

Option Limitation:

Option	Maximum IF BW
B4X	400 MHz
B8X	800 MHz
B12	1200 MHz

Center Frequency Limitation:

Center Frequency	Maximum IF BW
330 MHz ~ 380 MHz	$(\text{CF} - 330 \text{ MHz}) * 2$
380 MHz ~ 550 MHz	100 MHz
550 MHz ~ 1310 MHz	200 MHz
1310 MHz ~ 2000 MHz	600 MHz
2000 MHz ~ 12300 MHz	1200 MHz
12300 MHz ~ 12900 MHz	$(12900 \text{ MHz} - \text{CF}) * 2$

Run-Time Scaling

Allows you to adjust the run-time scaling value. The run-time scaling value is applied in real-time while the waveform is playing.

Remote Command	<code>:SOURce:RADio:ARB:RSCaling <real></code> <code>:SOURce:RADio:ARB:RSCaling?</code>
Example	<code>:SOUR:RAD:ARB:RSC 100.00</code>
Notes	Cannot be set in EXM and VXT. Grayed-out in menu, and the value is fixed at 70.00%
Dependencies	When a new waveform is selected for playback the settings contained within the associated waveform header file are applied to the ARB. The run-time scaling is one of the values stored within the header

	file. If the newly selected waveform file has an associated header file, the run-time scaling is updated with the value from the header file. The run-time scaling will remain unchanged if the newly selected waveform does not have an associated header file
Preset	70.00 %
Min	1.00 %
Max	100.00 %

Baseband Freq Offs

Allows you to adjust the value by which the baseband frequency is offset relative to the carrier.

Remote Command	<code>:SOURce:RADio:ARB:BASEband:FREQuency:OFFSet <freq></code> <code>:SOURce:RADio:ARB:BASEband:FREQuency:OFFSet?</code>
Example	<code>:SOUR:RAD:ARB:BAS:FREQ:OFFS 0.00 Hz</code>
Dependencies	When a new waveform is selected for playback the settings contained within the associated waveform header file are applied to the ARB. The baseband frequency offset is one of the values stored within the header file. If the newly selected waveform file has an associated header file, the baseband frequency offset is updated with the value from the header file. The baseband frequency offset will remain unchanged if the newly selected waveform does not have an associated header file Not available in E7760B
Preset	0.00 Hz
Min	-50.00 MHz
Max	50.00 MHz

Baseband Power

Allows you to quickly control the power of the modulator prior to up-conversion to the RF carrier.

Remote Command	<code>:SOURce:RADio:ARB:BASEband:POWer <amp;gt;</code> <code>:SOURce:RADio:ARB:BASEband:POWer?</code>
Example	<code>:SOUR:RAD:ARB:BAS:POW -10 dB</code>
Notes	The Source Power level equals RF Power plus Baseband Power. For example, if the RF Power is set to -10 dBm and the Baseband Power is set to -4 dB, the actual Source Power level is -14 dBm This control can be used to change the output level very quickly compared to the RF Power
Dependencies	Only appears in VXT models SP900B/11A/15A/16A
Preset	0 dB
Min	-50 dB
Max	20 dB

Mkr 1 Polarity

Allows you to set the polarity of marker 1.

Remote Command	<code>:SOURce:RADio:ARB:MPOLarity:MARKer1 POSitive NEGative</code> <code>:SOURce:RADio:ARB:MPOLarity:MARKer1?</code>
Example	<code>:SOUR:RAD:ARB:MPOL:MARK1 NEG</code>
Dependencies	When a new waveform is selected for playback the settings contained within the associated waveform header file are applied to the ARB. The marker polarity is one of the values stored within the header file. If the newly selected waveform file has an associated header file, the marker polarity is updated with the value from the header file. The marker polarity will remain unchanged if the newly selected waveform does not have an associated header file Not available in E7760B
Preset	<code>POSitive</code>
Range	<code>POSitive NEGative</code>

Mkr 2 Polarity

Allows you to set the polarity of marker 2.

Remote Command	<code>:SOURce:RADio:ARB:MPOLarity:MARKer2 POSitive NEGative</code> <code>:SOURce:RADio:ARB:MPOLarity:MARKer2?</code>
Example	<code>:SOUR:RAD:ARB:MPOL:MARK2 NEG</code>
Dependencies	When a new waveform is selected for playback the settings contained within the associated waveform header file are applied to the ARB. The marker polarity is one of the values stored within the header file. If the newly selected waveform file has an associated header file, the marker polarity is updated with the value from the header file. The marker polarity will remain unchanged if the newly selected waveform does not have an associated header file Not available in E7760B
Preset	<code>POSitive</code>
Range	<code>POSitive NEGative</code>

Mkr 3 Polarity

Allows you to set the polarity of marker 3.

Remote Command	<code>:SOURce:RADio:ARB:MPOLarity:MARKer3 POSitive NEGative</code> <code>:SOURce:RADio:ARB:MPOLarity:MARKer3?</code>
Example	<code>:SOUR:RAD:ARB:MPOL:MARK3 NEG</code>
Dependencies	When a new waveform is selected for playback the settings contained within the associated waveform

	header file are applied to the ARB. The marker polarity is one of the values stored within the header file. If the newly selected waveform file has an associated header file, the marker polarity is updated with the value from the header file. The marker polarity will remain unchanged if the newly selected waveform does not have an associated header file Not available in E7760B
Preset	POSitive
Range	POSitive NEGative

Mkr 4 Polarity

Allows you to set the polarity of marker 4.

Remote Command	:SOURce:RADio:ARB:MPOLarity:MARKer4 POSitive NEGative :SOURce:RADio:ARB:MPOLarity:MARKer4?
Example	:SOUR:RAD:ARB:MPOL:MARK4 NEG
Dependencies	When a new waveform is selected for playback the settings contained within the associated waveform header file are applied to the ARB. The marker polarity is one of the values stored within the header file. If the newly selected waveform file has an associated header file, the marker polarity is updated with the value from the header file. The marker polarity will remain unchanged if the newly selected waveform does not have an associated header file Not available in E7760B
Preset	POSitive
Range	POSitive NEGative

Pulse/RF Blank

Allows you to select which marker is used for **Pulse/RF Blank**. This function blanks the RF when the marker signal goes low. The marker polarity determines when the marker signal is high. For a positive polarity, this is during the marker points. For a negative polarity, this is when there are no marker points.

Marker points should be set before using this function. Enabling this function without setting maker points may create a continuous low or high signal, dependent on the marker polarity. This causes either no RF output, or a continuous RF output.

Remote Command	:SOURce:RADio:ARB:MDESTination:PULSe NONE M1 M2 M3 M4 For option details, see " More Information " on page 2944 :SOURce:RADio:ARB:MDESTination:PULSe?
Example	:SOUR:RAD:ARB:MDES:PULS NONE
Dependencies	When a new waveform is selected for playback the settings contained within the associated waveform header file are applied to the ARB. The Pulse/RF Blank setting is one of the values stored within the header file. If the newly selected waveform file has an associated header file, the Pulse/RF Blank

setting is updated with the value from the header file. The **Pulse/RF Blank** setting remains unchanged if the newly selected waveform does not have an associated header file

Range [NONE](#) | [M1](#) | [M2](#) | [M3](#) | [M4](#)

More Information

Parameter	SCPI Example	Notes
None	<code>:SOUR:RAD:ARB:MDES:PULS NONE</code>	Sets no marker to be used for Pulse/RF Blank function, essentially turning the RF blanking function off
Marker 1	<code>:SOUR:RAD:ARB:MDES:PULS M1</code>	Sets marker 1 to be used for Pulse/RF Blank
Marker 2	<code>:SOUR:RAD:ARB:MDES:PULS M2</code>	Sets marker 2 to be used for Pulse/RF Blank
Marker 3	<code>:SOUR:RAD:ARB:MDES:PULS M3</code>	Sets marker 3 to be used for Pulse/RF Blank
Marker 4	<code>:SOUR:RAD:ARB:MDES:PULS M4</code>	Sets marker 4 to be used for Pulse/RF Blank

ALC Hold

Allows you to specify which marker is routed for use within **ALC Hold**. This function holds the ALC circuitry at the average value of the sample points set by the marker.

ALC Hold operates during the low periods of the marker signal. The marker polarity determines when the marker signal is high. For positive polarity, this is during the marker points. For a negative polarity, this is when there are no marker points.

Remote Command `:SOURce:RADio:ARB:MDEStination:ALCHold NONE` | [M1](#) | [M2](#) | [M3](#) | [M4](#)

For option details, see ["More Information" on page 2944](#)

`:SOURce:RADio:ARB:MDEStination:ALCHold?`

Example `:SOUR:RAD:ARB:MDES:ALCH NONE`

Dependencies When a new waveform is selected for playback the settings contained within the associated waveform header file are applied to the ARB. The **ALC Hold** setting is one of the values stored within the header file. If the newly selected waveform file has an associated header file, the **ALC Hold** setting is updated with the value from the header file. The **ALC Hold** setting remains unchanged if the newly selected waveform does not have an associated header file

Not available in E7760B, and VXT models SP900B/11A/15A/16A

Range [NONE](#) | [M1](#) | [M2](#) | [M3](#) | [M4](#)

More Information

None `:SOUR:RAD:ARB:MDES:PULS` Use no marker for **ALC Hold**, essentially

	NONE	turning ALC Hold off
Marker 1	<code>:SOUR:RAD:ARB:MDES:PULS M1</code>	Use marker 1 for ALC Hold
Marker 2	<code>:SOUR:RAD:ARB:MDES:PULS M2</code>	Use marker 2 for ALC Hold
Marker 3	<code>:SOUR:RAD:ARB:MDES:PULS M3</code>	Use marker 3 for ALC Hold
Marker 4	<code>:SOUR:RAD:ARB:MDES:PULS M4</code>	Use marker 4 for ALC Hold

Trigger Type

Determines the behavior of the waveform when it plays.

Remote Command	<code>:SOURce:RADio:ARB:TRIGger:TYPE CONTInuous SINGle SADVance</code> <code>:SOURce:RADio:ARB:TRIGger:TYPE?</code>
Example	<code>:SOUR:RAD:ARB:TRIG:TYPE CONT</code> <code>:SOUR:RAD:ARB:TRIG:TYPE?</code>
Preset	<code>CONTInuous</code>
Range	Continuous Single Seg Adv

Continuous trigger

Sets the active trigger type to **Continuous**. If **Continuous** is already selected as the active trigger type, pressing this control allows access to the **Continuous trigger** type setup menu. In **Continuous** trigger mode, the waveform repeats continuously.

Remote Command	<code>:SOURce:RADio:ARB:TRIGger:TYPE:CONTInuous[:TYPE] FREE TRIGger RESet</code> For option details, see " More Information " on page 2945 <code>:SOURce:RADio:ARB:TRIGger:TYPE:CONTInuous[:TYPE]?</code>
Example	<code>:SOUR:RAD:ARB:TRIG:TYPE:CONT FREE</code>
Preset	<code>FREE</code>
Range	Free Run Trigger + Run Reset + Run

More Information

Parameter	SCPI Example	Notes
Free Run	<code>:SOUR:RAD:ARB:TRIG:TYPE:CONT FREE</code>	Sets the waveform generator to play a waveform sequence or segment continuously, without waiting for a trigger. In this mode, the waveform generator does not respond to triggers
Trigger + Run	<code>:SOUR:RAD:ARB:TRIG:TYPE:CONT TRIG</code>	Sets the waveform generator to

Parameter	SCPI Example	Notes
Reset + Run	<code>:SOUR:RAD:ARB:TRIG:TYPE:CONT RES</code>	play a waveform sequence or segment continuously when the first trigger is received, and to ignore any subsequent triggers Sets the waveform generator to play a waveform sequence or segment continuously when the first trigger is received. Subsequent triggers reset the waveform sequence or segment to the start, and then play it continuously

Single trigger

Sets the active trigger type to **Single**. If **Single** is already selected as the active trigger type, pressing this control allows access to the single trigger type setup menu. In **Single** trigger mode, the waveform plays once.

Remote Command	<code>:SOURce:RADio:ARB:RETRigger ON OFF IMMEDIATE</code> For option details, see " More Information " on page 2946 <code>:SOURce:RADio:ARB:RETRigger?</code>
Example	<code>:SOUR:RAD:ARB:RETR OFF</code>
Notes	ON : Buffered Trigger OFF : No Retrigger IMMEDIATE : Restart on Trigger This is defined as an enumerated SCPI command, with ON OFF being considered as enumerated types rather than Boolean. This means the query returns OFF instead of 0, and ON instead of 1
Preset	ON

More Information

Parameter	SCPI Example	Notes
No Retrigger	<code>:SOUR:RAD:ARB:RETR OFF</code>	Sets the waveform generator to play a waveform sequence or segment once when a trigger is received. Any triggers then received during playback are ignored
Buffered Trigger	<code>:SOUR:RAD:ARB:RETR ON</code>	Sets the waveform generator to play a waveform sequence or segment once when a trigger is received. If a trigger is received during playback, the waveform generator plays the sequence or segment to the end, then plays the sequence or

Parameter	SCPI Example	Notes
Restart on Trigger	<code>:SOUR:RAD:ARB:RETR IMM</code>	segment once more Sets the waveform generator to play a waveform sequence or segment once when a trigger is received. If a trigger is received during playback, the waveform generator resets and plays the sequence or segment from the start

Segment Advance trigger

Sets the active trigger type to **Segment Advance**. If **Segment Advance** is already selected as the active trigger type, pressing this control allows access to the segment advance trigger type setup menu.

Segment Advance triggering allows you to control the playback of waveform segments within a waveform sequence. When a trigger is received the ARB advances to the next waveform segment within the waveform sequence. This type of triggering ignores the repetition count for the waveform segment within the waveform sequence. For example, if a waveform segment has a repetition count of 10 and you select single segment advance triggering mode, the waveform segment will only play once.

Segment Advance triggering can also be used for waveform segments only. In this situation, the same waveform segment is played again when a trigger is received.

For option details, see ["More Information" on page 2947](#)

Remote Command	<code>:SOURce:RADio:ARB:TRIGger:TYPE:SADVance[:TYPE] SINGle CONTInuous :SOURce:RADio:ARB:TRIGger:TYPE:SADVance[:TYPE]?</code>
Example	<code>:SOUR:RAD:ARB:TRIG:TYPE:SADV SING</code>
Dependencies	Not available in E7760B
Preset	<code>CONTInuous</code>
Range	<code>SINGle CONTInuous</code>

More Information

Parameter	SCPI Example	Notes
Single	<code>:SOUR:RAD:ARB:TRIG:TYPE:SADV SING</code>	Once a trigger is received a segment is played once. If a trigger is received during playback of a segment, the segment plays to completion and the next segment is played once
Continuous	<code>:SOUR:RAD:ARB:TRIG:TYPE:SADV</code>	Once a trigger is received a

Parameter	SCPI Example	Notes
	<code>CONT</code>	segment is played continuously. When subsequent triggers are received, the currently playing segment plays to completion and then the next segment is played continuously
Trigger Initiate	No remote command, front panel only	If "Trigger Source" on page 2948 is set to <code>KEY</code> , initiates an immediate trigger event

Trigger Source

Determines how the source receives the trigger that starts the waveform playing. Grayed-out if ["Trigger Type" on page 2945](#) is free run, since free run triggers immediately with no trigger source required.

Remote Command	<code>:SOURce:RADio:ARB:TRIGger[:SOURce] KEY BUS EXTernal1 EXTernal2 PXI</code> For options details, see "More Information" on page 2948 <code>:SOURce:RADio:ARB:TRIGger[:SOURce]?</code>
Example	<code>:SOUR:RAD:ARB:TRIG KEY</code>
Notes	For E7760B, the available selections are <code>KEY BUS</code>
Dependencies	Grayed-out if Trigger Type is Continuous, Free Run
Preset	<code>EXTernal2</code> For E7760B: <code>BUS</code>
Range	<code>Key Bus External1 External 2 PXI</code>

More Information

Parameter	SCPI Example	Notes
Key	<code>:SOUR:RAD:ARB:TRIG KEY</code>	The waveform is triggered when you press the front panel Trigger key
Bus	<code>:SOUR:RAD:ARB:TRIG BUS</code>	Enables triggering over GPIB, LAN, or USB using: <code>:SOURce:RADio:ARB:TRIGger:INITiate</code>
External 1	<code>:SOUR:RAD:ARB:TRIG EXT1</code>	Enables triggering a waveform by an externally-applied signal
External 2	<code>:SOUR:RAD:ARB:TRIG EXT2</code>	Enables triggering a waveform by an externally-applied signal Note: in EXM, trigger 2 is a bi-directional trigger port, so when trigger 2 has been configured as OUTPUT type, selecting External 2 as the input

Parameter	SCPI Example	Notes
PXI	<code>:SOUR:RAD:ARB:TRIG PXI</code>	trigger for the current step generates an error Note 2: in VXT model SP900B, triggers on an externally connected trigger source marked Trigger 1 on the front panel Enables triggering a waveform by a PXI backplane Line applied signal

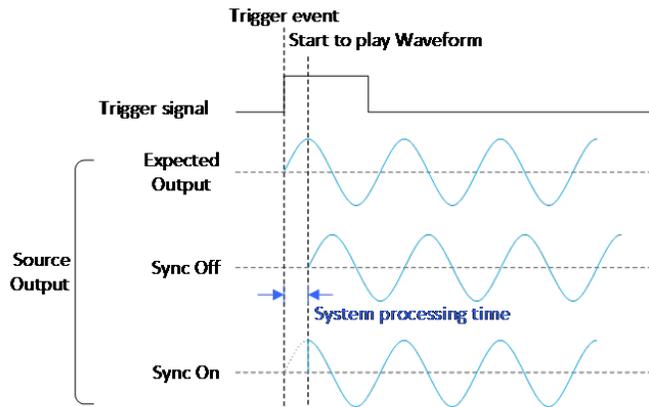

Bus Trigger Command (Remote Command Only)

Used to initiate an immediate trigger event if "[Trigger Source](#)" on page 2948 is set to **BUS**.

Remote Command	<code>:SOURce:RADio:ARB:TRIGger:INITiate</code>
Example	<code>:SOUR:RAD:ARB:TRIG:INIT</code>

Sync to Trigger Source

There is a time interval (system processing time) between the trigger event and the beginning of playing waveform. Turn on this control to compensate the system latency at the cost of cutting off the beginning of the ARB. The figure below shows the turn-on and turn-off behavior of the control.

6 Input/Output
6.1 RF Source

Remote Command	<code>:SOURce:RADio:ARB:TRIGger:SYNC[:STATe] ON OFF 1 0</code> <code>:SOURce:RADio:ARB:TRIGger:SYNC[:STATe]?</code>
Example	<code>:SOUR:RAD:ARB:TRIG:SYNC ON</code> <code>:SOUR:RAD:ARB:TRIG:SYNC?</code>
Notes	Compensates for the instrument internal latency. The negative trigger delay compensates the external latency (that is, heads and cables). See "External Trigger Delay" on page 2950 and "PXI Trigger Delay" on page 2952 The first PerARB trigger is cut off if Sync to Trigger Source is ON
Dependencies	Only available when "Trigger Source" on page 2948 is EXTernal11 , EXTernal12 , or PXI
Preset	OFF
Range	ON OFF

External Trigger Delay

Allows you to toggle the state and value of external trigger delay. The value you enter sets a delay time between when an external trigger is received and when it is applied to the waveform. Only active if ["Trigger Source" on page 2948](#) is **EXTernal11** or **EXTernal12**.

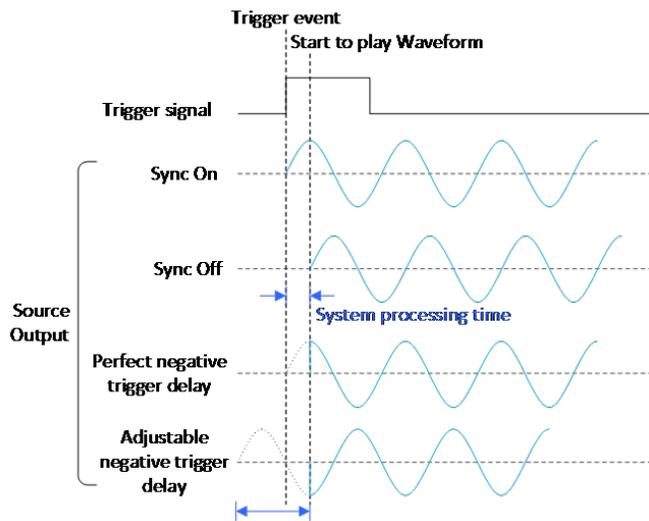

Negative trigger delay is only supported by VXT models SP900B/11A/15A/16A (see ["More Information" on page 2951](#)).

Remote Command	<code>:SOURce:RADio:ARB:TRIGger[:SOURce]:EXTernal:DELay <time></code> <code>:SOURce:RADio:ARB:TRIGger[:SOURce]:EXTernal:DELay?</code> <code>:SOURce:RADio:ARB:TRIGger[:SOURce]:EXTernal:DELay:STATe OFF ON 0 1</code> <code>:SOURce:RADio:ARB:TRIGger[:SOURce]:EXTernal:DELay:STATe?</code>
Example	<code>:SOUR:RAD:ARB:TRIG:EXT:DEL 100ns</code> <code>:SOUR:RAD:ARB:TRIG:EXT:DEL?</code> <code>:SOUR:RAD:ARB:TRIG:EXT:DEL:STAT ON</code> <code>:SOUR:RAD:ARB:TRIG:EXT:DEL:STAT?</code>
Notes	External trigger delay time set by users will be rounded to the nearest integer multiple of the resolution
Dependencies	Unavailable and grayed-out when Trigger Source is not set to EXTernal11 or EXTernal12 Not available in E7760B
Preset	1 ms OFF
Min	VXT models SP900B/11A/15A/16A: -10 s All others: 0 s

Max	Instrument/Condition	Value	Derivation
	VXT models SP900B/11A/15A/16A	11.45324612 s	$2.666667\text{ns} * (2^{32}-1)$
	Continuous – Trigger + Run	11.45324612 s	$2.666667\text{ns} * (2^{32}-1)$
	Other trigger conditions	17.17986918 s	$4\text{ ns} * (2^{32}-1)$
	All others	8.589934588 s	$4\text{ns} * (2^{31} - 1) = 8589934588\text{ ns}$

More Information

There is a time interval (system processing time) between the trigger event and the beginning of playing waveform. The figure below shows you the behavior. The negative trigger delay allows you to specify the beginning of a waveform.

Note: the first PerArb trigger signal will be missed when the trigger delay is negative.

External Trigger Polarity

Sets the polarity of the external trigger. When **POSitive** is selected, trigger event happens on a rising edge of the external trigger in signal. When **NEGative** is selected, trigger event happens on a falling edge of the external trigger in signal.

Active only if "**Trigger Source**" on page 2948 is **EXTernal1** or **EXTernal2**.

Remote Command	<code>:SOURce:RADio:ARB:TRIGger[:SOURce]:EXTernal:SLOPe POSitive NEGative</code> <code>:SOURce:RADio:ARB:TRIGger[:SOURce]:EXTernal:SLOPe?</code>
Example	<code>:SOUR:RAD:ARB:TRIG:EXT:SLOP POS</code> <code>:SOUR:RAD:ARB:TRIG:EXT:SLOP?</code>
Dependencies	Unavailable and grayed-out when " Trigger Source " on page 2948 is not EXTernal1 or EXTernal2 Not available in E7760B
Preset	POSitive
Range	POSitive NEGative

Select PXI Line

Controls which **PXI_TRIG[0..7]** backplane line is used for the trigger source.

Only appears in modular analyzer products.

Remote Command	<code>:SOURce:RADio:ARB:TRIGger[:SOURce]:PXI:LINE <line></code> <code>:SOURce:RADio:ARB:TRIGger[:SOURce]:PXI:LINE?</code>
Example	<code>:SOUR:RAD:ARB:TRIG:PXI:LINE 2</code>
Dependencies	Unavailable and grayed-out when " Trigger Source " on page 2948 is not set to PXI Not available in E7760B
Preset	0
State Saved	Saved in instrument state
Range	[0,7]

PXI Trigger Delay

Allows you to toggle the state and value of PXI trigger delay. The value you enter sets a delay time between when an PXI trigger is received and when it is applied to the waveform.

Only active if "**Trigger Source**" on page 2948 is **PXI**.

Remote Command	<code>:SOURce:RADio:ARB:TRIGger[:SOURce]:PXI:DElay <time></code>
----------------	--

	<code>:SOURce:RADio:ARB:TRIGger[:SOURce]:PXI:DELay?</code> <code>:SOURce:RADio:ARB:TRIGger[:SOURce]:PXI:DELay:STATe OFF ON 0 1</code> <code>:SOURce:RADio:ARB:TRIGger[:SOURce]:PXI:DELay:STATe?</code>															
Example	<code>:SOUR:RAD:ARB:TRIG:PXI:DEL 100ns</code> <code>:SOUR:RAD:ARB:TRIG:PXI:DEL?</code> <code>:SOUR:RAD:ARB:TRIG:PXI:DEL:STAT ON</code> <code>:SOUR:RAD:ARB:TRIG:PXI:DEL:STAT?</code>															
Notes	PXI trigger delay time set by users will be rounded to the nearest integer multiple of the resolution															
Dependencies	Unavailable and grayed-out when "Trigger Source" on page 2948 is not PXI Not available in E7760B															
Preset	1 ms OFF															
Min	VXT models SP900B/11A/15A/16A: -10 s															
Max	<table border="1"> <thead> <tr> <th>Instrument/Condition</th> <th>Value</th> <th>Derivation</th> </tr> </thead> <tbody> <tr> <td>VXT models SP900B/11A/15A/16A</td> <td>11.45324612 s</td> <td>2.666667ns * (2³²-1)</td> </tr> <tr> <td>Continuous – Trigger + Run” trigger</td> <td>11.45324612 s</td> <td>2.666667ns * (2³²-1)</td> </tr> <tr> <td>Other trigger conditions</td> <td>17.17986918 s</td> <td>4 ns * (2³²-1)</td> </tr> <tr> <td>All Others</td> <td>8.589934588 s</td> <td>4ns * (2³¹ – 1)</td> </tr> </tbody> </table>	Instrument/Condition	Value	Derivation	VXT models SP900B/11A/15A/16A	11.45324612 s	2.666667ns * (2 ³² -1)	Continuous – Trigger + Run” trigger	11.45324612 s	2.666667ns * (2 ³² -1)	Other trigger conditions	17.17986918 s	4 ns * (2 ³² -1)	All Others	8.589934588 s	4ns * (2 ³¹ – 1)
Instrument/Condition	Value	Derivation														
VXT models SP900B/11A/15A/16A	11.45324612 s	2.666667ns * (2 ³² -1)														
Continuous – Trigger + Run” trigger	11.45324612 s	2.666667ns * (2 ³² -1)														
Other trigger conditions	17.17986918 s	4 ns * (2 ³² -1)														
All Others	8.589934588 s	4ns * (2 ³¹ – 1)														

PXI Trigger Polarity

Sets the polarity of the PXI trigger:

- When **POSitive** is selected, trigger event happens on a rising edge of the PXI trigger in signal
- When **NEGative** is selected, trigger event happens on a falling edge of the PXI trigger in signal

Active only if "Trigger Source" on page 2948 is **PXI**.

Remote Command	<code>:SOURce:RADio:ARB:TRIGger[:SOURce]:PXI:SLOPe POSitive NEGative</code> <code>:SOURce:RADio:ARB:TRIGger[:SOURce]:PXI:SLOPe?</code>
Example	<code>:SOUR:RAD:ARB:TRIG:PXI:SLOP POS</code> <code>:SOUR:RAD:ARB:TRIG:PXI:SLOP?</code>
Dependencies	Unavailable and grayed-out when "Trigger Source" on page 2948 is PXI Not available in E7760B
Preset	POSitive
Range	POSitive NEGative

I/Q Adjustments

Enables or disables the I/Q adjustments.

Remote Command	<code>:SOURce:RADio:ARB:IQADjustment:[STATe] OFF ON 0 1</code> <code>:SOURce:RADio:ARB:IQADjustment:[STATe]?</code>
Example	<code>:SOUR:RAD:ARB:IQAD ON</code> <code>:SOUR:RAD:ARB:IQAD?</code>
Dependencies	Not available in E7760B
Preset	OFF

I/Q Gain

Allows you to adjust the ratio of I to Q while preserving the composite, vector magnitude. Adding Gain (+x dB) to the signal increases the I component and decreases the Q component proportionally. Reducing Gain (-x dB) decreases the I component and increases the Q component proportionally.

Remote Command	<code>:SOURce:RADio:ARB:IQADjustment:GAIN <value><unit></code> <code>:SOURce:RADio:ARB:IQADjustment:GAIN?</code>
Example	<code>:SOUR:RAD:ARB:IQAD:GAIN 0.5</code> <code>:SOUR:RAD:ARB:IQAD:GAIN?</code>
Notes	Effective only if the I/Q adjustment function is ON
Dependencies	Unavailable and grayed-out when the ARB state is OFF Not available in E7760B
Preset	+0.00000000E+000
Min	-1 dB
Max	1 dB

I/Q Delay

Enables you to change the absolute phase of both I and Q with respect to triggers and markers. A positive value delays I and Q. This value affects both the external I/Q out signals and the baseband signal modulated on the RF output. This adjustment does not affect external I/Q inputs.

Remote Command	<code>:SOURce:RADio:ARB:IQADjustment:DELAy <value><unit></code> <code>:SOURce:RADio:ARB:IQADjustment:DELAy?</code>
Example	<code>:SOUR:RAD:ARB:IQAD:DEL 10ps</code>

	<code>:SOUR:RAD:ARB:IQAD:DEL?</code>
Notes	User-set IQ delay time values are rounded to the nearest integer multiple of the resolution
Dependencies	Unavailable and grayed-out when the ARB state is off Not available in E7760B
Preset	+0.00000000E+000
Min	-250ns
Max	250ns

RMS

Allows you to directly specify current RMS value used to playback currently selected waveform.

For EXM, note that an incorrect RMS value may cause inaccurate power output that is sensitive to RMS value.

This setting is also updated by RMS in waveform header or updated when invoking RMS calculation operation.

This setting can be saved to the header of currently selected waveform by ["Save Header" on page 2978](#).

Remote Command	<code>:SOURce:RADio:ARB:RMS <float></code> <code>:SOURce:RADio:ARB:RMS?</code>
Example	<code>:SOUR:RAD:ARB:HEAD:RMS 0.7</code> <code>:SOUR:RAD:ARB:HEAD:RMS?</code>
Notes	The valid range for this setting is 0 to 1.414 (linear). Values outside the range are clipped to the closest boundary This value does not affect Source List Sequencer, which always uses the RMS value included in each ARB header. If this setting is to take effect in List Sequencer, use "Save Header" on page 2978 to save the current RMS value to the header, then play the ARB in Source List Sequencer
Dependencies	When a new waveform is selected for playback this setting is updated by the RMS value included in the associated waveform header file. If the selected waveform has no associated header file or the header file does not include the RMS value then the instrument will try to calculate the value automatically based on the RMS Calculation Mode setting Pressing Calculate also updates this setting
Preset	0
Range	0 ~ 1.414

RMS Calculation Mode

Allows you to specify the mode to calculate the current RMS.

6 Input/Output
6.1 RF Source

Remote Command	<code>:SOURCE:RADio:ARB:RMS:CALCulation:MODE AUTO M1 M2 M3 M4</code> For option details, see "More Information" on page 2956 <code>:SOURCE:RADio:ARB:RMS:CALCulation:MODE?</code>
Example	<code>:SOUR:RAD:ARB:RMS:CALC:MODE AUTO</code>
Notes	If no waveform is selected, or selected waveform is waveform sequence, the key is grayed-out
Preset	<code>AUTO</code>
Range	<code>AUTO M1 M2 M3 M4</code>

More Information

Parameter	SCPI Example	Notes
Auto	<code>:SOUR:RAD:ARB:RMS:CALC:MODE AUTO</code>	In Auto, RMS is calculated based on the whole sample range of the currently selected waveform
Marker 1	<code>:SOUR:RAD:ARB:RMS:CALC:MODE M1</code>	Marker 1 designates the sample range for RMS calculation
Marker 2	<code>:SOUR:RAD:ARB:RMS:CALC:MODE M2</code>	Marker 2 designates the sample range for RMS calculation
Marker 3	<code>:SOUR:RAD:ARB:RMS:CALC:MODE M3</code>	Marker 3 designates the sample range for RMS calculation
Marker 4	<code>:SOUR:RAD:ARB:RMS:CALC:MODE M4</code>	Marker 4 designates the sample range for RMS calculation

Calculate

Allows you to calculate current RMS based on mode selected. Updates the setting in the ["RMS" on page 2955](#) control.

Remote Command	<code>:SOURCE:RADio:ARB:RMS:CALCulate</code>
Example	<code>:SOUR:RAD:ARB:RMS:CALC</code>
Notes	<p>If no waveform is selected, invoking this operation generates error “-221 Setting conflict; No waveform is selected for RMS operation”</p> <p>Grayed-out if no waveform is selected, or selected waveform is waveform sequence</p> <p>If selected waveform does not contain marker data, but "RMS Calculation Mode" on page 2955 is set to marker, invoking a calculation operation generates error “-221 Setting conflict; There is no marker for currently selected waveform, auto RMS calculation mode is used instead”, and "RMS Calculation Mode" on page 2955 is coupled to Auto mode automatically</p> <p>RMS calculation is not suitable for waveform sequence. If selected waveform is waveform sequence file, invoking this operation generates error “-221 Setting conflict; RMS calculation does not apply to waveform sequence”</p> <p>You can still edit current RMS as play parameter, and save current RMS to waveform sequence header for later use</p>

Use Header RMS

Allows you to quickly set RMS to value in ARB header. Updates the setting in the "RMS" on page 2955 control.

Notes	<p>Grayed-out if no waveform is selected</p> <p>If no waveform is selected, invoking this operation generates error “-221 Setting conflict; No waveform is selected for RMS operation”</p>
-------	--

Real-Time 5G NR Compensation

Phase compensation is a new concept introduced into 5G NR baseband signal generation in TS38.211 as below, to address a typical 5G scenario that Tx and Rx frequencies may not be the same. In that case, without properly compensating the phase, receiver would not be able to correctly demodulate the received signal.

Modulation and up-conversion to the carrier frequency f_0 of the complex-valued OFDM baseband signal for antenna port p , subcarrier spacing configuration μ , and OFDM symbol l in a subframe assumed to start at $t = 0$ is given by the following equation for all channels and signals except PRACH:

$$\text{Re} \left\{ s_l^{(p,\mu)}(t) \cdot e^{j2\pi f_0(t - t_{start,l}^\mu - N_{CP,l}^\mu T_C)} \right\}$$

From the 3GPP specification equation above, it can be observed that phase compensation is performed for a specific transmission frequency f_0 . So that means, even if a same signal configuration needs to be transmitted at multiple frequencies, we'll have to generate a different waveform for each frequency point. As a result, the number of test waveforms will increase significantly along with the frequency number. This would be a big challenge for test engineers, considering the complexity of 5G NR signal configurations - they have to maintain a large waveform library and identify each waveform carefully with its “frequency tag”.

Real-Time 5G NR Phase Compensation allows you to play the same 5G NR waveform while performing phase compensation along with transmission frequency change automatically. This control allows you to turn on or off the real-time phase compensation for 5G NR waveform.

Remote Command	<code>:SOURce:RADio:ARB:NR5G:PHASe[:STATe] ON OFF 1 0</code> <code>:SOURce:RADio:ARB:NR5G:PHASe[:STATe]?</code>
----------------	--

Example	<code>:SOUR:RAD:ARB:NR5G:PHAS ON</code> <code>:SOUR:RAD:ARB:NR5G:PHAS?</code>
---------	--

6 Input/Output
6.1 RF Source

Dependencies	Only appears when Option RPC is present If the waveform is not for 5G NR, there may be error message and the output signal may be incorrect To ensure that you do <i>not</i> compensate for phase twice, once at waveform generation and again during playback, turn off this control if you had turned on phase compensation while generating the waveform
Preset	OFF
Range	ON OFF

SCS

Sets the SCS for real-time 5G NR phase compensation.

Remote Command	:SOURCE:RADio:ARB:NR5G:PHASe:SCS SCS15K SCS30K SCS60K SCS60KECP SCS120K SCS240K SCS480K :SOURCE:RADio:ARB:NR5G:PHASe:SCS?		
Example	:SOUR:RAD:ARB:NR5G:PHAS:SCS SCS15K :SOUR:RAD:ARB:NR5G:PHAS:SCS?		
Preset	SCS30K		
Range	μ	CP	Value
	0		15 kHz
	1		30 kHz
	2	Normal	60 kHz
		Extended	60 kHz
	3		120 kHz
	4		240 kHz
	5		480 kHz

Filter

Sets the state of Filter usage after real-time 5G NR phase compensation.

Remote Command	:SOURCE:RADio:ARB:NR5G:PHASe:FILTer[:STATe] ON OFF 1 0 :SOURCE:RADio:ARB:NR5G:PHASe:FILTer[:STATe]?		
Example	:SOUR:RAD:ARB:NR5G:PHAS:FILT ON :SOUR:RAD:ARB:NR5G:PHAS:FILT?		
Preset	OFF		
Range	ON OFF		

Filter Bandwidth

Sets the Filter Bandwidth if Filter is used.

By searching <FilterBandwidth> node in the *.scp file, you can get the correct filter bandwidth value for phase compensation.

Remote Command	<code>:SOURce:RADio:ARB:NR5G:PHASe:FILTer:BANDwidth <freq></code> <code>:SOURce:RADio:ARB:NR5G:PHASe:FILTer:BANDwidth?</code>
Example	<code>:SOUR:RAD:ARB:NR5G:PHAS:FILT:BAND 99MHz</code> <code>:SOUR:RAD:ARB:NR5G:PHAS:FILT:BAND?</code>
Preset	100 MHz
Min	10 Hz
Max	1200 MHz

Select Waveform

Allows you to select a waveform segment or sequence to be played by the ARB player. Presents you with a list of waveform segments files and waveform sequence files. The list of waveform segment files and waveform sequence files contains the names of all the waveform segments and waveform sequence files currently loaded into ARB playback memory.

Waveform sequences are not available in E7760B.

Waveforms formatted as *.mat, *.csv and *.txt are supported by models with a built-in source, such as VXT and EXM.

NOTE

To load a file from the hard drive into ARB memory, go to the **Recall, Waveform dialog**

NOTE

Selecting a waveform file does not result in automatic adjustments to burst timing; that adjustment occurs only when a waveform is loaded to ARB memory.

Remote Command	<code>:SOURce:RADio:ARB:WAVeform <string></code> <code>:SOURce:RADio:ARB:WAVeform?</code>
Example	<code>:SOUR:RAD:ARB:WAV "test_waveform.bin"</code>
Notes	If the intended waveform is not in the memory yet, then issuing this command invokes ARB loading operation first, which involves a delay of unpredictable length, so this command should be followed by *OPC?, which holds off subsequent commands until the loading operation is complete <code><string></code> - specifies the name of the waveform segment or waveform sequence to be played by the

ARB

Sequence Analyzer Mode only:

- If Include Source is Yes, and you attempt to play a waveform sequence but not all the required waveform segments are in the ARB playback memory, the application rejects the loading operation and an error is generated
- If Include Source is No, and you attempt to play a waveform sequence but not all the required waveform segments are contained in the ARB playback memory, the application attempts to load the required segments from either the default directory or the current directory. If the ARB memory does not have enough space for all the waveform segments to be loaded, an error is generated and none of the waveform segments is loaded

If ARB is **ON**, and you attempt to play a waveform sequence but not all the waveform segments within the sequence could be found to be loaded into ARB memory, an error is generated. The selected waveform keeps the previous value and ARB state remains On

If you specify a waveform segment via SCPI but the waveform segment is not present within ARB playback memory, and cannot be found for auto loading within the current directory or the default directory, an error is generated and the file selection remains unchanged

If you select a waveform for playback and the waveform requires a license that is not installed on the instrument, an error is generated.

If ARB is **ON** and you load a file to ARB memory or delete a file from ARB memory, the playing waveform segment may not keep phase continuity during the ARB memory operation. The waveform will be replayed after the ARB operation is finished

Segments in ARB Memory

Shows you which files are loaded into the ARB memory and lets you select a file for playback.

Recall Waveform

This is the same as **Recall From File** in the **Recall, Waveform** dialog.

Delete Segment From ARB Mem

This is the same as **Delete Segment From ARB Mem** in the **Recall, Waveform** dialog.

Delete All From ARB Memory

This is the same as **Delete All From ARB Memory** in the **Recall, Waveform** dialog.

OK

Inserts the currently-highlighted waveform at the end of the waveform sequence, and returns you to the **Edit Sequence** dialog.

Cancel

Discards any changes, and returns you to the **Build New Sequence** dialog.

Query ARB Memory File List (Remote Query Only)

Queries the test set for the list of waveform segments in the ARB memory.

NOTE

Returns a string for waveform segment names in ARB memory. If you require a string list of waveform segments in the ARB memory, use **"Query ARB Memory Full File List (Remote Query Only)"** on page 2961

Remote Command	<code>:SOURce:RADio:ARB:CATalog?</code>						
Example	<code>:SOUR:RAD:ARB:CAT?</code>						
Notes	The return data is in the following format:						
	<table border="1"> <tr> <td><code><integer></code></td> <td>Memory used</td> </tr> <tr> <td><code><integer></code></td> <td>Memory free</td> </tr> <tr> <td><code><string> ...</code></td> <td>Comma-separated list of waveform segments within ARB memory</td> </tr> </table>	<code><integer></code>	Memory used	<code><integer></code>	Memory free	<code><string> ...</code>	Comma-separated list of waveform segments within ARB memory
<code><integer></code>	Memory used						
<code><integer></code>	Memory free						
<code><string> ...</code>	Comma-separated list of waveform segments within ARB memory						

Query ARB Memory Full File List (Remote Query Only)

Queries the test set for the string list of waveform segments in the ARB memory. Returns a string list for waveform segment names in the ARB memory.

Remote Command	<code>:SOURce:RADio:ARB:FCATalog?</code>								
Example	<code>:SOUR:RAD:ARB:FCAT?</code>								
Notes	The return data is in the following format:								
	<table border="1"> <tr> <td><code><integer></code></td> <td>Memory used</td> </tr> <tr> <td><code><integer></code></td> <td>Memory free</td> </tr> <tr> <td><code><integer></code></td> <td>File count in ARB memory</td> </tr> <tr> <td><code><string>,<string>, ...
<string></code></td> <td>Comma-separated string list of waveform segments within ARB memory</td> </tr> </table>	<code><integer></code>	Memory used	<code><integer></code>	Memory free	<code><integer></code>	File count in ARB memory	<code><string>,<string>, ...
<string></code>	Comma-separated string list of waveform segments within ARB memory
<code><integer></code>	Memory used								
<code><integer></code>	Memory free								
<code><integer></code>	File count in ARB memory								
<code><string>,<string>, ...
<string></code>	Comma-separated string list of waveform segments within ARB memory								
	EXT returns: 27499,2069653,3,"c2k.wfm","gsm.wfm","wcdma.wfm"								

Waveform Sequences

Not available in E7760B.

Lets you build new sequences or edit existing sequences. The Sequences table displayed in this dialog shows you the sequences in the current directory. You may build a new sequence or select one of the sequences in the table and tap **Edit Selected Sequence**. The default current directory is **C:\NVARB**. Tapping any element of this path lets you select an alternate route. Tapping the **Computer** arrow lets you select a different drive. Tapping the **Back** arrow navigates to the previously selected directory.

Build New Sequence

Lets you build a new sequence of waveform segments. When you build a sequence you are building the “current sequence”, and the next time you press “Build New Sequence” the sequence you have been building will still be there, allowing you to add or remove segments from it.

Segment

Shows the segment number assigned to this row.

Waveform

Shows the file name for the waveform inserted into this row. Use "[Insert Waveform](#)" on page 2964 to insert a waveform.

Repetitions

Allows you to specify the number of times the currently selected waveform is played within the sequence.

Preset	1
Min	1
Max	65535

Marker 1

Allows you to enable or disable marker 1 for the currently selected waveform. For a waveform sequence, you can enable and disable markers on a per-segment basis,

allowing you to output markers from some waveform segments within the sequence, but not for others.

Preset	Enabled
Range	Enabled Disabled

Marker 2

Allows you to enable or disable marker 2 for the currently selected waveform. For a waveform sequence, you can enable and disable markers on a per-segment basis, allowing you to output markers from some waveform segments within the sequence, but not for others.

Preset	Enabled
Range	Enabled Disabled

Marker 3

Allows you to enable or disable marker 3 for the currently selected waveform. For a waveform sequence, you can enable and disable markers on a per-segment basis, allowing you to output markers from some waveform segments within the sequence, but not for others.

Preset	Enabled
Range	Enabled Disabled

Marker 4

Allows you to enable or disable marker 4 for the currently selected waveform. For a waveform sequence, you can enable and disable markers on a per-segment basis, allowing you to output markers from some waveform segments within the sequence, but not for others.

Preset	Enabled
Range	Enabled Disabled

Sync Seq File

Enables or disables the saving of secondary modules' waveform sequence files based on the current primary module segment's waveform settings.

Remote Command	<code>:SOURCE:RADio:ARB:SEquence:SYNC ON OFF</code> <code>:SOURCE:RADio:ARB:SEquence:SYNC?</code>
----------------	--

Example	<code>:SOUR:RAD:ARB:SEQ:SYNC OFF</code>
Notes	<p>Available only on primary modules</p> <p>If this setting is ON, when Sync Config is not NONE, the responding secondary module's waveform sequence file will be saved accordingly when save sequence... on the primary module, and the primary sequence file name should end with <code>xxx0.seq</code>, so the secondary module will be named according to the "Naming Rule" on page 2964</p> <p>Waveform names in sequence files should also follow the Naming Rule</p>
Dependencies	Not available in E7760B
Preset	OFF
Range	ON OFF

Naming Rule

If Sync Config is not 2x2 +2x2 or 1x1+1x1, the waveform files to be used should follow this naming convention: the waveform file for the primary source should end in 0; the waveform files for the controlled sources should end in 1, 2, or 3 (reflecting the order of the TRXs). For example, for DL 11AC80 3X3 MIMO, sequence file names for TRX1, TRX2 and TRX3 should be xxx0.xx, xxx1.xx and xxx2.xx

If Sync Config is 2x2+2x2, the waveform files to be used should follow this naming convention: the waveform file for the primary source of first 2x2 should end in 0_0; the waveform files for the secondary source of first 2x2 should end in 0_1; the waveform files for the primary source of second 2x2 should end in 1_0; the waveform files for the secondary source of second 2x2 should end in 1_1. For example, for DL 11AC80 2x2 + 2x2 MIMO, waveform file names for TRX1, TRX2, TRX3 and TRX4 should be xxx0_0.xx, xxx0_1.xx, xxx1_0.xx and xxx1_1.xx

If Sync Config is 1x1+1x1, the waveform files to be used should follow this naming convention: the waveform file for the first source should end in 0_0; the waveform files for the second source should end in 1_0. For example, for DL 11AC80 1x1 + 1x1 MIMO, waveform file names for TRX1 and TRX2 should be xxx0_0.xx and xxx1_0.xx

Insert Waveform

Allows you to select a waveform segment to be added to the sequence.

NOTE

To load a file from the hard drive into ARB memory, go to the **Recall, Waveform** dialog

Segments in ARB Memory

Shows you which files are loaded into the ARB memory and lets you select a file for inclusion in the sequence.

Delete Segment From ARB Mem

This is the same as **Delete Segment From ARB Mem** in the **Recall, Waveform** dialog.

Delete All From ARB Memory

This is the same as **Delete All From ARB Memory** in the **Recall, Waveform** dialog.

OK

Inserts the currently highlighted waveform at the end of the waveform sequence, and returns you to the **Edit Sequence** dialog.

Cancel

Discards any changes, and returns you to the **Build New Sequence** dialog.

Delete Segment

Allows you to delete the selected segment from the waveform sequence.

Save Sequence

Allows you to save the newly built Waveform Sequence to the disk drive.

Sequence files have the extension **.seq**. The default filename is **WfmSequence_0000.seq**, where the 4-digit number is the lowest number that does not conflict with any filename in the current directory. Use “File Name” and “File Type” to specify your waveform sequence. The newly build sequence will be stored in the current directory.

Build New Sequence (Remote Command Only)

This is the SCPI equivalent of the waveform sequence creation features described in ["Build New Sequence" on page 2962](#).

6 Input/Output
6.1 RF Source

Writes a waveform sequence file to the hard disk. You must specify the waveform sequence file path and filename which will be saved on the hard disk, and the waveform segment file path and name which will be nested into the waveform sequence file. You can utilize mass storage unit specifier (MSUS) "NVWFM" or use a real full path representation. See the example below. MSUS "NVWFM" is mapped to D:\NVARB directory on test set hard disk.

Any number of segments, up to a segment count limit of 64, can be used to create a sequence. Repeated segments are included in the count limit.

Each waveform segment name string length upper limit is 128 chars. Do not attempt to insert a waveform with a name string that exceeds 128 chars.

The internal source does not support nesting one waveform sequence file into another waveform sequence file.

Remote Command

```
:SOURce:RADio:ARB:SEquence[:MWAVeform] <filename>, <waveform1>, <reps>,
NONE | M1 | M2 | M3 | M4 | M1M2 | M1M3 | M1M4 | M2M3 | M2M4 | M3M4 |
M1M2M3 | M1M2M4 | M1M3M4 | M2M3M4 | M1M2M3M4 | ALL, \{<waveform2>,
<reps>, NONE | M1 | M2 | M3 | M4 | M1M2 | M1M3 | M1M4 | M2M3 | M2M4 |
M3M4 | M1M2M3 | M1M2M4 | M1M3M4 | M2M3M4 | M1M2M3M4 | ALL,\} ...
```

For additional description of each item, see ["For Setup SCPI" on page 2966](#) below

```
:SOURce:RADio:ARB:SEquence[:MWAVeform]? <filename>
```

For additional description of each item, see ["For Query SCPI" on page 2968](#) below

Example

For setup:

```
:SOUR:RAD:ARB:SEQ "NVWFM:testSeq1.seq", "NVWFM:wfmSegment1.wfm",10,
M2M3M4, "NVWFM:wfmSegment2.wfm", 20, M1M3
```

Or

```
:SOUR:RAD:ARB:SEQ "D:\NVARB\testSeq1.seq", "D:\NVARB\w-
fmSegment1.wfm",10, M2M3M4, "D:\NVARB\wfmSegment2.wfm", 20, M1M3
```

For query, must specify which waveform sequence file to query

```
:SOUR:RAD:ARB:SEQ? "NVWFM:testSeq1.seq"
```

Or

```
:SOUR:RAD:ARB:SEQ? "D:\NVARB\testSeq1.seq"
```

For Setup SCPI

For the Setup SCPI command, the parameters are:

<filename> - String Type

This variable specifies the path and name for the waveform sequence file. The path supports MSUS (NVWFM) or a real full path representation. See example.

<waveform1> - String Type

This variable specifies the path and name of the first existing waveform segment. The path supports MSUS (NVWFM) or a real full path representation. See example.

The segment file must reside within ARB playback memory before it can be played by the ARB player.

<reps> - Integer Type

This variable specifies the number of times a segment or sequence plays before moving on to the next segment or sequence.

<marker> - Enum Type

NONE – This choice disables all four markers for the waveform. Disabling markers means that the waveform sequence ignores the segments or sequence marker settings.

M1, M2, M3, M4 – these choices, either individually or a combination of them, enable the markers for the waveform segment or sequence. Markers not specified are ignored for that segment or sequence.

ALL – This choice enables all four markers in the waveform segment or sequence.

<waveform2> - String type.

This variable specifies the name of a second existing waveform segment. The path supports MSUS (NVWFM) and real full path representation both. See example.

The segment file must reside within ARB playback memory before it can be played by the ARB player.

<reps> same as above, for the 2nd waveform segment.

<marker> same as above, for the 2nd waveform segment.

You can insert several waveform segments into a waveform sequence file. Just repeat inserting waveform segments as described above.

Error Checks for Setup SCPI command:

If you do not specify a filename, or you use an unsupported MSUS (that is, not NVWFM), or have an error in the waveform sequence file path, an error is generated. If the specified waveform sequence file name suffix is not “.seq”, error is generated.

If you use an unsupported MSUS (that is, not NVWFM), or have an error in the waveform segment file path, an error is generated.

If the first specified waveform file cannot be found, an error is generated.

If you nest one waveform sequence file into another waveform sequence file, an error is generated.

If the specified repetition value is larger than 65535 or smaller than 1, an error is generated.

If the specified marker type is unrecognized, an error is generated.

For Query SCPI

For the Query the parameters are:

`<filename>` - String type.

This variable specifies the path and name of the waveform sequence file being queried. The path supports MSUS (NVWFM) or a real full path representation. See example.

The return value is a `<string>`, which includes each waveform segment file name, repetitions, and marker type. For example:

```
>:SOUR:RAD:ARB:SEQ? "NVWFM:testSeq1.seq",  
<"wfmSegment1.wfm, 10, ALL, wfmSegment2.wfm, 20, M1M3",
```

Error Checks for Query SCPI command:

If you do not specify a filename, an error is generated.

If the waveform sequence file name is empty, an error is generated. If the specified waveform sequence file cannot be found, an error is generated.

Edit Selected Sequence

This dialog lets you edit an existing sequence of waveform segments. A table of the segments in the currently selected sequence displays, allowing you to insert waveform segments or edit the characteristics of each segment.

Segment

This field in the table shows the segment number assigned to this row.

Waveform

This field in the table shows the file name for the waveform inserted into this row. Use ["Insert Waveform" on page 2964](#) to insert a waveform.

Repetitions

This field in the table allows you to specify the number of times the currently selected waveform is played within the sequence.

Preset	1
Min	1

Marker 1

This field in the table allows you to enable or disable marker 1 for the currently selected waveform. For a waveform sequence, you can enable and disable markers on a per-segment basis, allowing you to output markers from some waveform segments within the sequence, but not for others.

Notes	No remote command, front panel only
Preset	Enabled
Range	Enabled Disabled

Marker 2

This field in the table allows you to enable or disable marker 2 for the currently selected waveform. For a waveform sequence, you can enable and disable markers on a per-segment basis, allowing you to output markers from some waveform segments within the sequence, but not for others.

Notes	No remote command, front panel only
Preset	Enabled
Range	Enabled Disabled

Marker 3

This field in the table allows you to enable or disable marker 3 for the currently selected waveform. For a waveform sequence, you can enable and disable markers on a per-segment basis, allowing you to output markers from some waveform segments within the sequence, but not for others.

Notes	No remote command, front panel only
Preset	Enabled
Range	Enabled Disabled

Marker 4

This field in the table allows you to enable or disable marker 4 for the currently selected waveform. For a waveform sequence, you can enable and disable markers on a per-segment basis, allowing you to output markers from some waveform segments within the sequence, but not for others.

Notes	No remote command, front panel only
-------	-------------------------------------

Preset	Enabled
Range	Enabled Disabled

Sync Seq File

Change this setting to enable/disable the function of saving secondary modules' waveform sequence files based on the current primary segment's waveform settings.

Remote Command	<code>:SOURce:RADio:ARB:SEQuence:SYNC ON OFF</code> <code>:SOURce:RADio:ARB:SEQuence:SYNC?</code>
Example	<code>:SOUR:RAD:ARB:SEQ:SYNC OFF</code>
Notes	This setting is available only on primary modules If this setting is ON , when Sync Config is not NONE , the responding secondary module's waveform sequence file will be saved accordingly when save sequence... on the primary module, and the primary sequence file name should end with xxx0.seq , so the secondary module will be named according to the "Naming Rule" on page 2970 Waveform names in sequence files should also follow the Naming Rule
Dependencies	Not available in E7760B
Preset	OFF
Range	ON OFF

Naming Rule

If Sync Config is not 2x2+2x2 or 1x1+1x1, the waveform files to be used should follow this naming convention: the waveform file for the primary source should end in 0; the waveform files for the controlled sources should end in 1, 2, or 3 (reflecting the order of the TRXs). For example, for DL 11AC80 3X3 MIMO, sequence file names for TRX1, TRX2 and TRX3 should be xxx0.xx, xxx1.xx and xxx2.xx

If Sync Config is 2x2+2x2, the waveform files to be used should follow this naming convention: the waveform file for the primary source of first 2x2 should end in 0_0; the waveform files for the secondary source of first 2x2 should end in 0_1; the waveform files for the primary source of second 2x2 should end in 1_0; the waveform files for the secondary source of second 2x2 should end in 1_1. For example, for DL 11AC80 2x2 + 2x2 MIMO, waveform file names for TRX1, TRX2, TRX3 and TRX4 should be xxx0_0.xx, xxx0_1.xx, xxx1_0.xx and xxx1_1.xx

If Sync Config is 1x1+1x1, the waveform files to be used should follow this naming convention: the waveform file for the first source should end in 0_0; the waveform files for the second source should end in 1_0. For example, for DL 11AC80 1x1 + 1x1 MIMO, waveform file names for TRX1 and TRX2 should be xxx0_0.xx and xxx1_0.xx

Insert Waveform

This dialog page allows you to select a waveform segment to be added to the sequence.

NOTE

To load a file from the hard drive into ARB memory, go to the **Recall, Waveform dialog**

Segments in ARB Memory

This table shows you which files are loaded into the ARB memory and lets you select a file for inclusion in the sequence.

Delete Segment From ARB Mem

Deletes a segment from ARB memory. This is the same as **Delete Segment From ARB Mem** in the **Recall, Waveform dialog**.

Delete All From ARB Memory

Removes all segments from ARB memory. This is the same as **Delete All From ARB Memory** in the **Recall, Waveform dialog**.

OK

Inserts the currently highlighted waveform at the end of the waveform sequences and returns you to the **Edit Sequence dialog**.

Cancel

Discards any changes, and returns you to the **Edit Sequence dialog**.

Delete Segment

Allows you to delete the current segment from the waveform sequence.

Notes No remote command, front panel only

Waveform Utilities

Not available in E7760B.

Only appears if there is at least one Multi-pack license installed in the instrument.

On modular instruments, such as EXM , multi-pack license operations are only allowed on the default module, that is, “TRX1” module for EXM.

For EXM, if access multi-pack license sub-menu from modules other than “TRX1”, an advisory message like “Please go to “TRX1” to operate multi-pack license” will display.

Add Waveform

Use this dialog to select and add waveforms. Pressing **OK** in this dialog adds the currently highlighted waveform to the next available slot, and returns you to the ["Waveform Utilities" on page 2972](#) dialog.

Remote Command	<code>:SYSTem:LKEY:WAVeform:ADD <string></code> or <code>:SYSTem:LIcense[:FPAck]:WAVeform:ADD <string></code>
Example	<code>:SYST:LKEY:WAV:ADD "mywaveform.wfm"</code> or <code>:SYST:LIC:WAV:ADD "mywaveform.wfm"</code>
Notes	<p>The second form, <code>:SYSTem:LIcense[:FPAck]:WAVeform:ADD</code>, is provided for consistency with Keysight signal sources. You can use either form</p> <p>Since adding a waveform segment to a Multi-Pack license causes the license slot to enter the trial period of only 48 hours, pressing this key causes a confirmation dialog to be displayed to ensure you do want to add the waveform segment to the Multi-Pack</p> <p>If you attempt to license a waveform that is already licensed using another slot an error is generated</p> <p>For EXM, if current module is not “TRX1” module, the key is grayed-out, and error message is generated “-221 Setting conflict; Not allowed on current module. Go to “TRX1” to operate multi-pack license” when invoking SCPI</p>
Dependencies	Only available if the currently selected file is a secure waveform requiring a license, and there is at least one slot available within at least one multi-pack license. Unavailable if the waveform highlighted is a secure waveform, but is already licensed

OK

Adds the currently highlighted waveform to the next available slot, and returns you to the ["Waveform Utilities" on page 2972](#) dialog.

Cancel

Discards any changes, and returns you to the ["Waveform Utilities" on page 2972](#) dialog.

Replace Selected Waveform

Allows you to replace the waveform in the currently selected slot with the waveform currently selected in the Multi-Pack License Waveform Add view. Pressing **OK** in this dialog replaces the waveform in the currently selected slot with that currently highlighted, and returns you to the ["Waveform Utilities" on page 2972](#) dialog.

Remote Command	<code>:SYSTem:LKEY:WAVeform:REPLace <int>, <string></code> or <code>:SYSTem:LIcense[:FPACK]:WAVeform:REPLace <int>, <string></code>
Example	<code>:SYST:LKEY:WAV:REPL 1, "myotherwaveform.wfm"</code> or <code>:SYST:LIC:WAV:REPL 1, "myotherwaveform.wfm"</code>
Notes	The second command form, <code>:SYSTem:LIcense[:FPACK]:WAVeform:REPLace</code> is provided for consistency with Keysight signal sources. You can use either form If you attempt to license a waveform that is already licensed using another slot an error is generated Waveform slot number <int> is positive. If you attempt to input a slot number less than or equals 0, an error is generated For EXM, if current module is not "TRX1" module, the key is grayed-out, and error message is generated "-221 Setting conflict; Not allowed on current module. Go to "TRX1" to operate multi-pack license" when invoking SCPI

OK

Replaces the waveform in the currently selected slot with that currently highlighted, and returns you to the ["Waveform Utilities" on page 2972](#) dialog.

Cancel

Discards any changes, and returns you to the ["Waveform Utilities" on page 2972](#) dialog.

Clear Waveform from Slot

Allows you to clear the waveform from the selected slot.

6 Input/Output

6.1 RF Source

Remote Command	<code>:SYSTem:LKEY:WAVeform:CLEar <int></code> or <code>:SYSTem:LICense[:FPACK]:WAVeform:CLEar <int></code>
Example	<code>:SYST:LKEY:WAV:CLE 1</code> or <code>:SYST:LIC:WAV:CLE 1</code>
Notes	The second form: <code>:SYSTem:LICense[:FPACK]:WAVeform:CLEar</code> is provided for consistency with the style of Keysight signal sources. You can use either form Waveform slot number <code><int></code> is positive. If you attempt to input a slot number less than or equal to 0, an error is generated For EXM, if current module is not "TRX1" module, the key is grayed-out, and error message is generated "-221 Setting conflict; Not allowed on current module. Go to "TRX1" to operate multi-pack license" when invoking SCPI
Dependencies	Only available if the currently selected slot is in the trial state

Lock Waveform in Slot

If the selected slot is in the trial state or the lock required state, the waveform that occupies the slot is locked and permanently licensed.

Remote Command	<code>:SYSTem:LKEY:WAVeform:LOCK <int></code> or <code>:SYSTem:LICense[:FPACK]:WAVeform:LOCK <int></code>
Example	<code>:SYST:LKEY:WAV:LOCK 1</code> or <code>:SYST:LIC:WAV:LOCK 1</code>
Notes	The command form <code>:SYSTem:LICense[:FPACK]:WAVeform:LOCK</code> is provided for consistency with Keysight signal sources. You can use either form Waveform slot number <code><int></code> is positive. If you attempt to input a slot number less than or equal to 0, an error is generated For EXM, if current module is not "TRX1" module, the key is grayed-out, and error message is generated "-221 Setting conflict; Not allowed on current module. Go to "TRX1" to operate multi-pack license" when invoking SCPI
Dependencies	Only available if the currently selected slot is in the trial state, or the lock required state

Slot Status Query (Remote Command Only)

Returns the status of the specified slot.

Remote Command	<code>:SYSTem:LKEY:WAVeform:STATus? <int></code> or
----------------	--

	<code>:SYSTem:LIcense[:FPACK]:WAVeform:STATus? <int></code>
Example	<code>:SYST:LKEY:WAV:STAT? 1</code> <code>:<"Locked"</code> or <code>:SYST:LIC:WAV:STAT? 1</code> <code>:<"Locked"</code>
Notes	<p>The command form <code>:SYSTem:LIcense[:FPACK]:WAVeform:STATus</code> is provided for consistency with Keysight signal sources. You can use either form</p> <p>Waveform slot number <code><int></code> is positive. If you attempt to input a slot number less than or equal to 0, an error is generated</p> <p>Result type is string. If input slot number exceeds total available slot numbers, "Nonexistent" is returned</p>
Range	"Locked" "Available" "Trail" "LockRequired" "Nonexistent"

Slots Free Query (Remote Query Only)

Returns the number of license slots free.

Remote Command	<code>:SYSTem:LKEY:WAVeform:FREE?</code> or <code>:SYSTem:LIcense[:FPACK]:WAVeform:FREE?</code>
Example	<code>:SYST:LKEY:WAV:FREE?</code> or <code>:SYST:LIC:WAV:FREE?</code>
Notes	<p>The second form: <code>:SYSTem:LIcense[:FPACK]:WAVeform:FREE</code> is provided for consistency with the style of Keysight signal sources. You can use either one</p>

Slot Used Query (Remote Query Only)

Returns the number of license slots used.

Remote Command	<code>:SYSTem:LKEY:WAVeform:USED?</code> or <code>:SYSTem:LIcense[:FPACK]:WAVeform:USED?</code>
Example	<code>:SYST:LKEY:WAV:USED?</code> or <code>:SYST:LIC:WAV:USED?</code>
Notes	<p>The second form: SCPI <code>:SYSTem:LIcense[:FPACK]:WAVeform:USED</code> is provided for consistency with the style of Keysight signal sources. You can use either form</p>

Slot Waveform Name Query (Remote Command Only)

Returns the waveform name of the specified slot.

Remote Command	<code>:SYSTem:LKEY:WAVeform:NAME? <int></code> or <code>:SYSTem:LICense[:FPACK]:WAVeform:NAME? <int></code>
Example	<code>:SYST:LKEY:WAV:NAME? 1</code> <code><"CDMA2K_22.wfm"></code> or <code>:SYST:LIC:WAV:NAME? 1</code> <code><"CDMA2K_22.wfm"></code>
Notes	Waveform slot number <code><int></code> is positive. If you attempt to input a slot number less than or equal to 0, an error is generated Result type is string. If input slot number exceeds total available slot numbers, "Nonexistent" is returned If no waveform stored in the specified slot, then empty string is returned

Slot Waveform Unique ID Query (Remote Command Only)

Returns the waveform unique ID of the specified slot.

Remote Command	<code>:SYSTem:LKEY:WAVeform:UID? <int></code> or <code>:SYSTem:LICense[:FPACK]:WAVeform:UID? <int></code>
Example	<code>:SYST:LKEY:WAV:UID? 2</code> <code><"1346752140"></code> or <code>:SYST:LIC:WAV:UID? 2</code> <code><"1346752140"></code>
Notes	Waveform slot number <code><int></code> is positive. If you attempt to input a slot number less than or equal to 0, an error is generated Result type is string. If input slot number exceeds total available slot numbers, "Nonexistent" is returned Only Signal Studio waveform has a unique ID, which is a positive number. User-generated waveforms have no unique ID. If no waveform is stored in the specified slot, returns "0"

Locked Waveform Name List Query (Remote Query Only)

Returns the waveform name list of locked.

Remote Command	<code>:SOURCE:RADio:ARB:MPLicensed:NAME:LOCKed?</code>
Example	<code>:SOUR:RAD:ARB:MPL:NAME:LOCKed?</code> <code>< "CDMA2K_27.wfm", "GSM_MCS1.WFM", "c2kwm.wfm"</code>

Locked Waveform Unique ID List Query (Remote Query Only)

Returns the waveform unique id list of locked.

Remote Command	<code>:SOURCE:RADio:ARB:MPLicensed:UID:LOCKed?</code>
Example	<code>:SOUR:RAD:ARB:MPL:UID:LOCKed?</code> <code>< "2996927136", "3812603511", "3710986266"</code>
Notes	Each Signal Studio waveform has a unique id recorded in header. If the unique ids are same, that means they are the same waveform. For this reason, in addition to the locked waveform name list query, there is also a locked waveform unique id list query

Multi-Pack License multi-module control state (Remote Command Only)

When **ON**, multi-pack license operations (such as adding/locking/replacinwaveform etc.) from TRXs other than TRX1 are allowed. If **OFF**, only TRX1 is allowed to operate multi-pack license, while other TRXs are only able to show the related multi-pack license information.

Remote Command	<code>:SERVICE[:PRODUCTION]:SOURCE:MCONTROL:MPLicense[:STATE] ON OFF 1 0</code> <code>:SERVICE[:PRODUCTION]:SOURCE:MCONTROL:MPLicense[:STATE]?</code>
Example	<code>:SERV:SOUR:MCON:MPL OFF</code>
Notes	Only effective in modular-based OBTs, such as EXM
Preset	OFF
Range	ON OFF

Header Utilities

If there is currently a waveform selected for playback, this table shows you the header information for the file. You can clear the header information out or edit it and save it.

Dependencies	Only available if there is currently a waveform selected for playback. Grayed-out if no waveform is selected
--------------	--

Clear Header

Allows you to clear the header information from the file header associated with the currently selected waveform.

Remote Command	<code>:SOURce:RADio:ARB:HEADer:CLEar</code>
Example	<code>:SOUR:RAD:ARB:HEAD:CLE</code>
Notes	Attempting to clear the header details via SCPI when no waveform was selected for playback generates an error

Save Header

Allows you to save new file header information details to the file.

Remote Command	<code>:SOURce:RADio:ARB:HEADer:SAVE</code>
Example	<code>:SOUR:RAD:ARB:HEAD:SAVE</code>
Notes	Attempting to save the header details via SCPI when no waveform was selected for playback generates an error

Query Waveform Unique ID (Remote Query Only)

Each Signal Studio waveform contains a unique waveform ID, which recorded in the header. This command allows you to query the unique waveform ID from the header.

Remote Command	<code>:MMEMory:HEADer:ID? "<file name>"</code>
Example	<code>:MMEM:HEAD:ID? "test.wfm"</code> query the waveform already loaded into the ARB memory <code>:MMEM:HEAD:ID? "D:\NVARB\test.wfm"</code> query the waveform on the hard disk by absolute path <code>:MMEM:HEAD:ID? "NVWFM:test.wfm"</code> query the waveform on the hard disk by MSUS
Notes	The queried waveform file can be in ARB memory, or on hard disk. If want to query ARB in ARB memory, then give out the file name directly. If want to query ARB on the hard disk, then absolute file path or MSUS should be given along with the file name. The valid MSUS is NVWFM , which is mapped to D:\NVARB on the hard disk If the file cannot be found in ARB memory or on hard disk, an error is generated and value -1 is returned

Query Selected Waveform Header info (Remote Query Only)

Returns a listing of the current selected ARB header info. If no ARB selected, then empty string is returned.

Remote Command	<code>:SOURCE:RADio:ARB:HEADer:INFormation?</code>																																						
Example	<code>:SOUR:RAD:ARB:HEAD:INF?</code>																																						
Notes	<p>After each colon of field title string, related header info string is appended</p> <p>The field title string in "Range" part cannot change, for Sequence Studio needs to accurately match those string character to know which header info field it is</p> <p>Below are the abbreviation descriptions:</p> <table border="1"> <thead> <tr> <th>DESC</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SR</td> <td>Sample Rate</td> </tr> <tr> <td>RTS</td> <td>Run Time Scaling</td> </tr> <tr> <td>RMS</td> <td>Root Mean Square</td> </tr> <tr> <td>M1P</td> <td>Marker 1 Polarity</td> </tr> <tr> <td>M2P</td> <td>Marker 2 Polarity</td> </tr> <tr> <td>M3P</td> <td>Marker 3 Polarity</td> </tr> <tr> <td>M4P</td> <td>Marker 4 Polarity</td> </tr> <tr> <td>ALCHR</td> <td>ALC Hold Routing</td> </tr> <tr> <td>RFBR</td> <td>RF Blank Routing</td> </tr> <tr> <td>FOFF</td> <td>Frequency Offset</td> </tr> <tr> <td>AWGNST</td> <td>AWGN State</td> </tr> <tr> <td>AWGNCN</td> <td>AWGN C/N Ratio</td> </tr> <tr> <td>AWNCBW</td> <td>AWGN Carrier Bandwidth</td> </tr> <tr> <td>AWGNNBW</td> <td>AWGN Noise Bandwidth</td> </tr> <tr> <td>AWNCRMS</td> <td>AWGN Carrier RMS</td> </tr> <tr> <td>ORP</td> <td>DAC Over Range Protection</td> </tr> <tr> <td>UID</td> <td>Unique ID</td> </tr> <tr> <td>LICSTS</td> <td>License Status</td> </tr> </tbody> </table>	DESC	Description	SR	Sample Rate	RTS	Run Time Scaling	RMS	Root Mean Square	M1P	Marker 1 Polarity	M2P	Marker 2 Polarity	M3P	Marker 3 Polarity	M4P	Marker 4 Polarity	ALCHR	ALC Hold Routing	RFBR	RF Blank Routing	FOFF	Frequency Offset	AWGNST	AWGN State	AWGNCN	AWGN C/N Ratio	AWNCBW	AWGN Carrier Bandwidth	AWGNNBW	AWGN Noise Bandwidth	AWNCRMS	AWGN Carrier RMS	ORP	DAC Over Range Protection	UID	Unique ID	LICSTS	License Status

6.1.12 Trigger Initiate

Initiates an immediate trigger event if the trigger source (under ARB Setup) is set to [KEY](#).

Dependencies Grayed-out unless Trigger Source is set to [KEY](#) and an ARB waveform is configured

6.1.13 Source Sync

Accesses a menu for setting up Source Synchronization for multiple models.

Only appears in modular products such as VXT, and only when the instrument is configured for MIMO analysis.

6.1.13.1 Sync Config

Allows you to config MIMO type for source.

Grayed-out when Primary and Secondary modules are in Sync State.

Remote Command [:SOURce:SYNC:CONFig NONE | TWO | THRee | FOUR | SIX | EIGHT | DONE | DTWO | DTHR | DFOU](#)

For option details, see "[More Information](#)" on page 2981

[:SOURce:SYNC:CONFig?](#)

Example [:SOUR:SYNC:CONF TWO](#)

Dependencies	EXM	2x2 and 1x1+1x1 MIMO are supported when license E6640A-M22 is enabled
		2x2 and 3x3 MIMO are supported when license E6640A-M33 is enabled
		2x2, 3x3, 4x4 and 2x2+2x2 MIMO are supported when license E6640A-M44 is enabled
	VXT models SP900B/ 11A	No-Across chassis MIMO is supported when license M941xA-MMO is enabled
		Across chassis MIMO is supported when license M941xA-MTS is enabled
	VXT models SP900B/ 16A	No-Across chassis MIMO is supported when license M941xA-MMO is enabled

Range [NONE | TWO | THRee | FOUR | SIX | EIGHT | DONE | DTWO | DTHR | DFOU](#)

More Information

Parameter	SCPI Example	Notes
None	<code>:SOUR:SYNC:CONF NONE</code>	Sets MIMO Config type as None
2x2	<code>:SOUR:SYNC:CONF TWO</code>	Sets 2x2 as MIMO Config Type. 2 models are configured to Sync
3x3	<code>:SOUR:SYNC:CONF THR</code>	Sets 3x3 as MIMO Config Type. 3 models are configured to Sync
4x4	<code>:SOUR:SYNC:CONF FOUR</code>	Sets 4x4 as MIMO Config Type. 4 models are configured to Sync
6x6	<code>:SOUR:SYNC:CONF SIX</code>	Sets 6x6 as MIMO Config Type. 6 models are configured to Sync
8x8	<code>:SOUR:SYNC:CONF EIGH</code>	Sets 8x8 as MIMO Config Type. 8 models are configured to Sync
1x1+1x1	<code>:SOUR:SYNC:CONF DONE</code>	Sets 1x1+1x1 as MIMO Config Type. 2 models are configured to Sync with different center frequency. Use Segment 2 Setup to config the second model
2x2+2x2	<code>:SOUR:SYNC:CONF DTWO</code>	Sets 2x2+2x2 as MIMO Config Type. 2 groups of 2x2 MIMO. First group consists of Primary and TRX1. Second group consists of TRX2 and TRX3. Segment 2 Setup allows you to config the second group
3x3+3x3	<code>:SOUR:SYNC:CONF DTHR</code>	Sets 3x3+3x3 as MIMO Config Type. 2 groups of 3x3 MIMO. First group consists of Primary, TRX1 and TRX2. Second group consists of TRX3, TRX4 and TRX5. Segment 2 Setup allows you to config the second group
4x4+4x4	<code>:SOUR:SYNC:CONF DFOU</code>	Sets 4x4+4x4 as MIMO Config Type. 2 groups of 4x4 MIMO. First group consists of Primary, TRX1, TRX2 and TRX3. Second group consists of TRX4, TRX5, TRX6 and TRX7. Segment 2 Setup allows you to config the second group

6.1.13.2 Sync Type

Grayed-out when models are in Sync State.

Remote Command	<code>:SOURce:SYNC:TYPE PRIMary SECondary OFF</code> For details of parameter options, see "Options" on page 2982 <code>:SOURce:SYNC:TYPE?</code>
Example	<code>:SOUR:SYNC:TYPE PRIM</code>

Preset	OFF
Range	PRIMary SECondary OFF

Options

Parameter	SCPI Example	Notes
OFF	:SOUR:SYNC:TYPE OFF	This model is not listed in the Secondary module List
SECondary	:SOUR:SYNC:TYPE SEC	Use :SOURCE:SYNC:CONNECTED:NAME? to obtain the Primary's name in Sync State
PRIMary	SOUR:SYNC:TYPE PRIM	Sync Setup is only available for Primary

6.1.13.3 Sync Settings

Grayed-out when Primary and Secondary are in Sync State.

Dependencies	Grayed-out when Sync Type is set to OFF or Secondary
--------------	--

Secondary Module List

Lists the parameters of Secondary modules. The Selected checkbox in each row allows you to select the Secondary module when the Sync Type is set to Primary.

- When Sync Config is set to NxN, use this control to enable N-1 Secondary modules
- When Sync Config is set to NxN+NxN, use this control to enable 2N-1 Secondary modules

See "[More Information](#)" on page 2983

Remote Command	:SOURCE:SYNC:REMOte:SECondary <integer> ON OFF 1 0 :SOURCE:SYNC:REMOte:SEC1?
Example	:SOUR:SYNC:REM:SEC1 ON :SOUR:SYNC:REM:SEC2 OFF
Notes	<integer> Secondary module number in Available Models
Preset	OFF

More Information

Parameter	SCPI Example	Notes
Available Secondary modules	<code>:SOUR:SYNC:REM:SEC:List?</code>	All the available Secondary models are listed
IP Address	<code>:SOUR:SYNC:REM:SEC<integer>:ADDR?</code> <code>:SOUR:SYNC:REM:SEC1:ADDR?</code>	Refer to Remote Chassis to add the IP Address for remote chassis "Local Host" indicates that the Primary and Secondary modules share the same chassis
Slot Number	<code>:SOUR:SYNC:REM:SEC<integer>:SLOT?</code> <code>:SOUR:SYNC:REM:SEC2:SLOT?</code>	Indicates the slot number of available models
Socket Port	<code>:SOUR:SYNC:REM:SEC<integer>:SPOR?</code> <code>:SOUR:SYNC:REM:SEC2:SPOR?</code>	Indicates the socket port of available models
Secondary module Order		Shows you the models to be Secondary devices Use Selected to choose from available Secondary models

Sync Settings

Lets you apply the source settings of the Primary module to its Secondary modules.

Remote Command	<code>:SOURce:SYNC:SETTings:ENABle ON OFF 1 0</code> <code>:SOURce:SYNC:SETTings:ENABle?</code>
Example	<code>:SOUR:SYNC:SETT:ENAB ON</code> <code>:SOUR:SYNC:SETT:ENAB?</code>
Notes	When Sync Settings is ON , the source settings of Primary are applied to Secondary modules. The supported settings are Amplitude, Frequency, Trigger Source, Trigger Type, RF Output and waveform related information When Sync Segment 2 is switched ON , this Toggle is set ON simultaneously
Dependencies	Waveform files naming convention: For NxN MIMO: <ul style="list-style-type: none"> - xxx0.wfm for Primary - xxx[n].wfm for TRX[n]

6 Input/Output

6.1 RF Source

For example, in 3x3 MIMO:

- xxx0.wfm for Primary
- xxx1.wfm for TRX1
- xxx2.wfm for TRX2

For NxN+NxN MIMO, in the first group:

- xxx0_0.wfm for Primary
- xxx0_n.wfm for TRX[n]

in the second group:

- xxx1_n.wfm for TRX[n+N]

For example, in 3x3+3x3 MIMO:

- xxx0_0 for Primary
- xxx0_1.wfm for TRX1
- xxx0_2.wfm for TRX2
- xxx1_0.wfm for TRX3
- xxx1_1.wfm for TRX4

xxx1_2.wfm for TRX5

Preset	OFF
Range	ON OFF

Sync Segment 2

Allows you to config the models in the second group of NxN+NxN MIMO.

Remote Command	:SOURce:SYNC:SETTings:SEGMent2:ENABle ON OFF 1 0 :SOURce:SYNC:SETTings:SEGMent2:ENABle?
Example	:SOUR:SYNC:SETT:SEGM2:ENAB ON :SOUR:SYNC:SETT:SEGM2:ENAB?
Notes	Only Frequency in settings is supported
Dependencies	When this setting is ON, Sync Settings will be turned on accordingly
Preset	OFF
Range	ON OFF

Segment 2 Frequency

When Sync Segment 2 is **ON**, allows you to set the frequency of models in the second group of NxN+NxN MIMO.

Remote Command	<code>:SOURce:SYNC:SETTings:SEGMENT2:FREQuency <freq></code> <code>:SOURce:SYNC:SETTings:SEGMENT2:FREQuency?</code>
Example	<code>:SOUR:SYNC:SETT:SEGM2:FREQ 1.00 GHz</code> <code>:SOUR:SYNC:SETT:SEGM2:FREQ?</code>
Preset	1.00 GHz
Min	VXT models SP900B/11A/15A/16A: 380 MHz
Max	Hardware Dependent VXT models SP900B/11A/15A/16A :- Option F06 = 6.0 GHz

IP Address

Sets up the controller's IP address of Remote Secondary models.

Remote Command	<code>:SOURce:SYNC:REMOte:ADDRess <string></code>
Example	<code>:SOUR:SYNC:REM:ADDR "192.168.1.2"</code>
Notes	<code><string></code> - IP Address

SCPI Socket Port

Sets up the controller's SCPI socket port of Remote Secondary models.

Remote Command	<code>:SOURce:SYNC:REMOte:IPPort <integer></code>
Example	<code>:SOUR:SYNC:REM:IPP 5025</code>
Notes	<code><integer></code> - Port

Add Secondary Module

Lets you connect the remote chassis specified by IP Address and Socket Port.

Remote Command	<code>:SOURce:SYNC:REMOte:ADDRess:ADD</code>
Example	<code>:SOUR:SYNC:REM:ADDR:ADD</code>
Notes	Example of how to add a remote chassis:

```
:SOUR:SYNC:REM:ADDR "192.168.1.2"
```

```
:SOUR:SYNC:REM:IPP 5025
```

```
:SOUR:SYNC:REM:ADDR:ADD
```

Once a remote chassis is connected, the ["Secondary Module List" on page 2982](#) shows you the available Secondary modules

Delete Secondary Module

Lets you delete a selected remote chassis IP Address from the ["Secondary Module List" on page 2982](#).

Remote Command	:SOURce:SYNC:REMOte:ADDRess:DELeTe
----------------	------------------------------------

Example	:SOUR:SYNC:REM:ADDR:DEL
---------	-------------------------

Notes	Example of how to delete a remote chassis: :SOUR:SYNC:REM:ADDR "192.168.1.2" :SOUR:SYNC:REM:ADDR:DEL
-------	--

Sync Runtime Settings (Remote Command Only)

Allows you to Sync runtime settings to the Secondary modules without restarting Sync.

Remote Command	:SOURce:SYNC:RTSetting:STATe ON OFF 1 0 :SOURce:SYNC:RTSetting:STATe?
----------------	--

Example	:SOUR:SYNC:RTS:STAT ON :SOUR:SYNC:RTS:STAT?
---------	--

Notes	When OFF , Sync is interrupted when changing frequency or power settings on the Primary module. After applying the new settings to the Secondary modules, Sync will restart When ON , setting changes on the Primary module are applied to the Secondary modules immediately without interrupting Sync status. This is the default behavior. The supported settings are Amplitude and Frequency
-------	--

Preset	ON
--------	----

Range	ON OFF
-------	----------

6.1.13.4 Sync Start

Allows you to start synchronizing Primary and Secondary modules to play Arb synchronously.

When the Sync connection is built successfully, Primary and Secondary modules are in the Sync State.

Sync Start and Sync Config menu are grayed-out when Primary and Secondary modules are in Sync State.

Remote Command	<code>:SOURce:SYNC:START</code>
Example	<code>:SOUR:SYNC:STAR</code>
Notes	If you change the source settings during Sync State, an error message appears in the status bar: "Settings conflict; Sync connection is already established" and the change will not be applied until Sync Stop

6.1.13.5 Sync Stop

Stops the synchronization.

When Sync Stops, Sync Config menu and Sync Start will be available.

Remote Command	<code>:SOURce:SYNC:STOP</code>
Example	<code>:SOUR:SYNC:STOP</code>

6.1.14 Source Preset

Allows you to preset the source settings to their default values.

Remote Command	<code>:SOURce:PRESet</code>
Example	<code>:SOUR:PRES</code>

6.2 Input

The controls on this tab let you select and configure the instrument's inputs.

6.2.1 Select Input

Lets you choose which signal input you want to analyze:

- "RF Input" on page 2990
- "External Mixer" on page 2990
- "I/Q" on page 2993

See also:

- "External Mixer Setup" on page 3016
- "I/Q Setup" on page 3035

Remote Command	<code>[:SENSe] :FEED RF AIQ EMIXer</code> <code>[:SENSe] :FEED?</code>
Example	<code>:FEED RF</code> Selects the RF Input <code>:FEED EMIX</code> Selects External Mixing <code>:FEED AIQ</code> Selects BBIQ <code>:FEED?</code>
Dependencies	I/Q only appears when Option BBA present Ext Mix only appears when Option EXM present
Couplings	Connecting a U7227A USB Preamplifier to one of the instrument's USB ports causes the Input to automatically switch to the RF Input. If the RF Calibrator is on, it is turned off. Subsequently disconnecting the USB Preamp from USB does not change the Input selection, nor restore the previous selection <code>[:SENSe] :FEED RF</code> turns the calibrator OFF
Preset	Unaffected by Preset or power cycle. Survives a Mode Preset and mode changes Set to RF by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state
Annotation	Displayed in the Meas Bar as "Input:." followed by: RF or Ext Mix or I/Q

	depending on which input is selected
Backwards Compatibility SCPI	<p><code>[:SENSe]:FEED AREFence</code></p> <p>In the PSA the calibrator was one of the inputs and selected using the AREF parameter to the same :FEED command that switched the inputs. In the X-Series, it is controlled in a separate menu and overrides the input selection. For code compatibility, <code>[:SENSe]:FEED AREFence</code> is provided, and is aliased to <code>[SENSe]:FEED:AREF REF50</code>, which causes the input to be switched to the 50 MHz calibrator. <code>[:SENSe]:FEED RF</code> switches the input back to the RF port and turns the calibrator OFF, thus providing full compatibility with the PSA calibrator function</p> <p>Note that after sending this, <code>[:SENSe]:FEED?</code> does <i>not</i> return "AREF" but instead the currently selected input:</p> <pre>[:SENSe]:FEED IQ IONLY QONLY [:SENSe]:FEED?</pre> <p>The parameters <code>IQ IONLY QONLY</code> are supported for backwards compatibility with the E44406A</p> <pre>[:SENSe]:FEED IQ aliases to [:SENSe]:FEED: IQ:TYPE IQ [:SENSe]:FEED IONLY aliases to [:SENSe]:FEED:IQ:TYPE IONLY [:SENSe]:FEED QONLY aliases to [:SENSe]:FEED:IQ:TYPE QONLY [:SENSe]:FEED? always returns AIQ, whatever type of legacy parameter IQ IONLY QONLY has been used</pre>
Backwards Compatibility Notes	<p>Most of the settings in the X-Series Input/Output system, including External Gain, Amplitude Corrections settings and data, etc., are shared by all modes and are not changed by a mode switch. Furthermore, most variables under the Input/Output menu are not affected by Mode Preset. Both of these behaviors represent a departure from legacy behavior</p> <p>In X-Series. Input/Output settings are reset by using Restore Input/Output Defaults. They can also be reset to their default values by System->Restore System Defaults-> In/Out Config, or by System ->Restore System Defaults -> All (and corresponding SCPI)</p> <p>While this matches most use cases better, it does create some code compatibility issues. For example, Amplitude Corrections are no longer turned off by Mode Preset, but instead by Restore Input/Output Defaults</p> <p>Although Input/Output settings are not part of each Mode's State, they are saved in Save State files, so that all of the instrument settings can be recalled with Recall, State, as in legacy instruments</p>
Example	<pre>:INP:MIX INT :INP:MIX?</pre>
Notes	<p>In legacy analyzers you choose between the Internal mixer or an External Mixer. In X-Series, the External Mixer is one of the choices for the Input and is selected using the FEED command (<code>:SENSe:FEED EXTMixer</code>)</p> <p>For compatibility, the <code>:INPut:MIXer EXTErnal INTernAl</code> legacy command is mapped as follows:</p> <ol style="list-style-type: none"> 1. When <code>:INPut:MIXer EXTErnal</code> is received, <code>:SENSe:FEED EMIXer</code> is executed 2. When <code>:INPut:MIXer INTernAl</code> is received, <code>:SENSe:FEED RF</code> is executed 3. When <code>:INPut:MIXer?</code> is received, the response is <code>INT</code> if any input other than the external mixer

	is selected, and EXT if the external mixer is selected
Preset	INT
Backwards Compatibility SCPI	:INPut:MIXer EXTernal INTernal :INPut:MIXer?
Backwards Compatibility Notes	PSA supports the following SCPI Command : :INPut:MIXer:TYPE PRESelected UNPReselect :INPut:MIXer:TYPE? PXA does not support the :INPut:MIXer:TYPE command

RF Input

Selects the front-panel RF input port to be the instrument signal input. If RF is already selected, pressing this key accesses the RF input setup functions.

External Mixer

Allows you to select an External Mixer through which to apply signal input to the instrument. When selected, the LO/IF port becomes the input to the instrument.

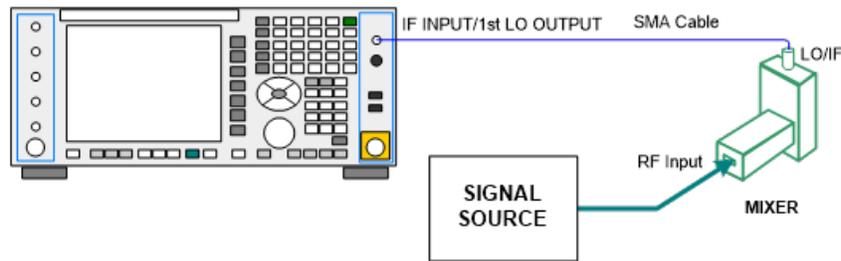

External Mixing requires option EXM. The External Mixer key will not appear unless option EXM is installed. The presence of the LO/IF connector alone does not indicate that you have Option EXM licensed. To verify that option EXM is installed, press **System, Show, System**.

When External Mixer is selected, the **Center Freq** key controls the setting of the Center Freq in external mixing, which is separate from the settings of Center Freq for the RF Input or BBIQ. Each input retains its unique settings for Center Freq. A unique SCPI command is provided solely for the external mixing Center Freq (see the **Center Freq** key description), which only affects the External Mixer CF, although sending the generic Center Freq command while External Mixer is selected also controls the External Mixer CF.

Unless option EXM is present, the External Mixer key is blanked, and all SCPI commands associated with menus accessed by this key return an error. Manual FFT mode is available with external mixing, but not with Signal ID. All settings under this key, and all Frequency settings, are remembered when you go out of External Mixer, so that when **External Mixer** is chosen again, all the external mixer functions will retain their previous settings, with the exception of Signal ID which is set to OFF (Signal ID is also set to Off unless External Mixer is the selected Input). Note that this differs from ESA and PSA, in which all external mixer settings including Center Frequency are lost when you turn off External Mixing or Preset the instrument.

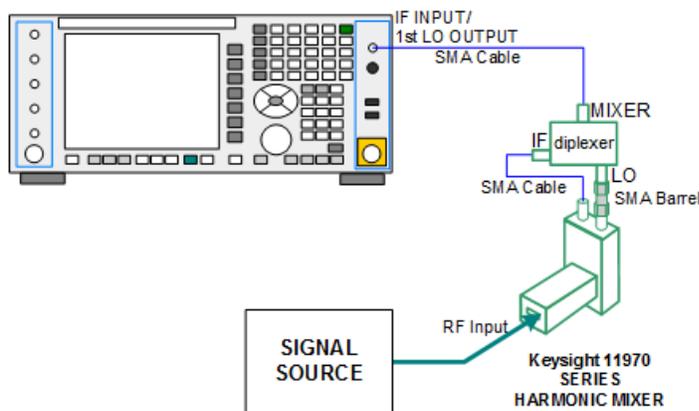

X-series instruments have a combined LO Out/IF In connection, whereas earlier instruments used separate ports for the LO Out and the IF in. Internal duplexers in

the instrument and the mixer simplify the connection for users – only a single SMA cable is required.

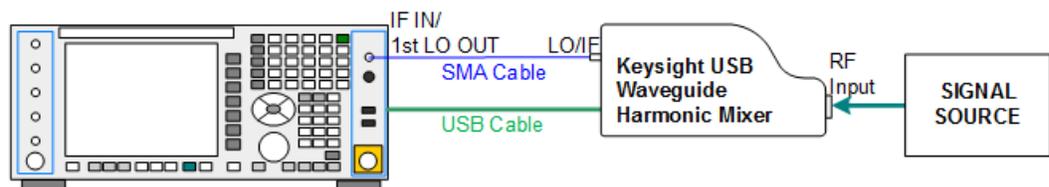

Legacy HP/Agilent and some third-party mixers have separate LO In and IF out connections. This requires you to use an external diplexer to connect these mixers. A diplexer can easily be purchased for this purpose (for example, Diplexer Model # DPL.26 or # DPL.313B from OML Inc., Morgan Hill, California, USA).

The connection diagram for such a legacy mixer is:

In addition, External Mixing in the X-Series supports the new Keysight M1970 series of Harmonic Mixers, which provide a USB connection for download of calibration data and additional control.

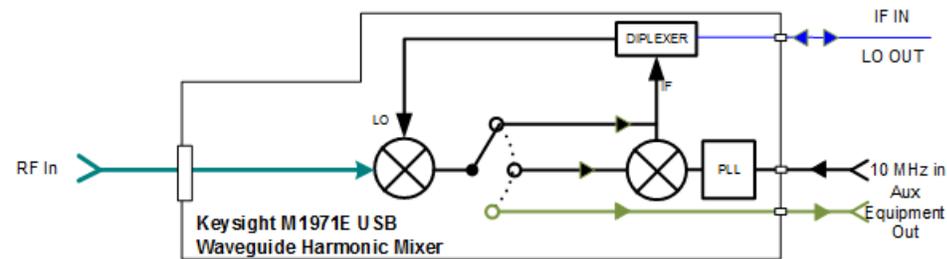

The connection diagram for one of the Keysight USB mixers is:

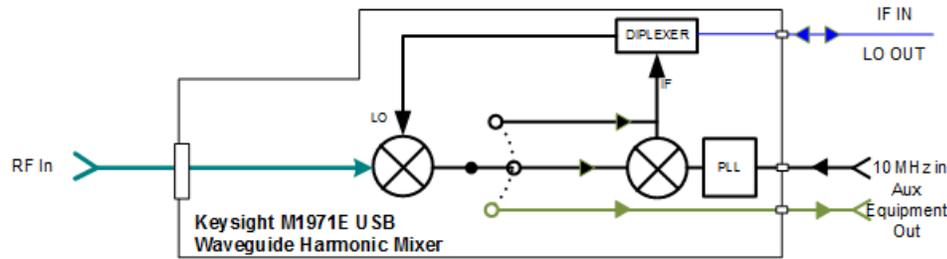

Also available in the M197x series are the M1971 series USB Mixers, which provide additional inputs and outputs for special functionality as described below. These mixers have multiple signal paths which allow them to function in three different states:

6 Input/Output
 6.2 Input

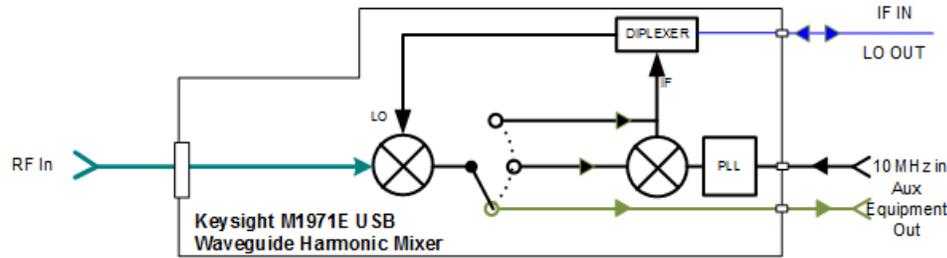

- Normal, in which the mixer functions as a classic external mixer with a single conversion:

- Dual Conversion, which gives you a wider image-free range. In Dual Conversion, the first conversion is to a higher IF frequency and you provide a 10 MHz signal to which an internal PLL is locked, to effect a second downconversion:

- Aux Equipment, wherein the first mixer output drives an output connector on the mixer and the instrument is out of the circuit:

External Mixing is only supported in certain Modes and Measurements in the X-Series, as shown in the table below. When External Mixer is selected in a measurement that does not support it, the "No result; Meas invalid with Ext Mixing" error condition occurs:

Mode	Measurements	Sig ID (Image Suppress only)
Spectrum Analyzer	Swept SA	Y*
	TOI	Y
	Harmonics	N
	Spurious Emissions	Y
	Channel Power	Y
	Occupied BW	Y
	ACP	Y
	Spectrum Emissions Mask	Y
	CCDF	N
	Burst Power	N
	List Sweep	N
Phase Noise	Monitor Spectrum	Y
	Log Plot	Y
	Spot Frequency	N
	Waveform	N
I/Q Analyzer	Complex Spectrum	N
	Waveform	N
Vector Signal Analyzer	Vector Analysis	N
	Analog Demod	N
	Digital Demod	N
Analog Demod	AM	N
	FM	N
	PM	N
	FM Stereo	N

* the Swept SA measurement also supports Image Shift

I/Q

Selects the front-panel I/Q input ports to be the instrument signal input. If I/Q is already selected, pressing this key accesses the I/Q setup menu.

The Baseband I/Q functionality is a hardware option. It is option BBA. If the option is not installed, none of the I/Q functionality is enabled.

The Baseband I/Q has four input ports and one output port. The input ports are I, I-bar, Q, and Q-bar. The I and I-bar together compose the I channel and the Q and Q-bar together compose the Q channel. Each channel has two modes of operation, Single-Ended (also called "unbalanced") and Differential Input (also called "balanced"). When in Single-Ended operation, only the main port (I or Q) is used and

6 Input/Output

6.2 Input

the complementary port (I-bar or Q-bar) is ignored. When in Differential Input mode, both main and complementary ports are used.

The input settings (range, attenuation, skew, impedance, external gain) apply to the channels, not the individual ports.

The system supports a variety of 1 M Ω input passive probes as well as the Keysight 113x Series active differential probes using the Infinimax probe interface.

The Keysight 113x Series active probes can be used for both single ended and differential measurements. In either case a single connection is made for each channel (on either the I or Q input). The input is automatically configured to 50 Ω single ended and the probe power is supplied through the Infinimax interface. The probe can be configured for a variety of input coupling and low frequency rejection modes. In addition, a wide range of offset voltages and probe attenuation accessories are supported at the probe interface. The active probe has the advantage that it does not significantly load the circuit under test, even with unity gain probing.

With passive 1 M Ω probes, the probe will introduce a capacitive load on the circuit, unless higher attenuation is used at the probe interface. Higher attenuation reduces the signal level and degrades the signal-to-noise-ratio of the measurement. Passive probes are available with a variety of attenuation values for a moderate cost. Most Keysight passive probes can be automatically identified by the system, setting the input impedance setting required as well as the nominal attenuation. For single ended measurements a single probe is used for each channel. Other passive probes can be used, with the attenuation and impedance settings configured manually.

For full differential measurements, the system supports probes on each of the four inputs. The attenuation of the probes should be the same for good common mode rejection and channel match.

Both active and passive probes in single ended and differential configurations can be calibrated. This calibration uses the Cal Out BNC connection and a probe connection accessory. The calibration achieves excellent absolute gain flatness in a probed measurement. It matches both the gain and frequency response of the I and Q channels as well as any delay skew, resulting in high accuracy in derived measurements such as Error Vector Magnitude (EVM).

When a probe is connected a status message will be displayed. The message will indicate if calibration data is available or not. Calibration data is saved for each type of probe (including "none") for each port and will be reapplied whenever that type of probe is re-connected to the same port. For probes with EEPROM identification, the calibration data will be stored based on the unique probe identifier and will reapply data for that particular probe if it is available. The data will not follow a probe from one port to another. For probes without EEPROM identification, the instrument

cannot distinguish between different probes of the same type, and it will use the data from the last calibration for that probe type on that port.

When in differential mode, both the main and complementary probes are expected to be of the same type.

In some situations, the I and Q channels should be configured identically. In other situations, it is convenient to control them independently. Some menus have a "Q Same as I" setting that will cause the Q channel configuration to mirror the I channel configuration, avoiding the overhead of double data entry when the channels should be the same.

The output port is for calibrating the I/Q input ports, although it can also be manually controlled.

There are two types of calibrations available: cable calibration and probe calibration. The cable calibration will guide the user through connecting each input port in turn. All ports must be calibrated together. The probe calibration is done for a specific channel (I or Q). If in Single-Ended mode, only the main port is calibrated. When in Differential Input mode, the user is guided through calibrating both main and complementary ports.

The front panel I/Q port LEDs indicate the current state of that port. On (green) indicates it is active, and off (dark) indicates it is not in use. For example, the Cal Out port LED is on if and only if there is signal coming out of that port.

The input is a context, and some parameters have separate values for each context. The SCPI for these parameters has an optional "[:RF|IQ]" node. If the specific context is omitted, the command acts on the current input context's value. Here are the parameters that are input context sensitive:

- Center Frequency
- Trigger Source

It is important to distinguish between the I and Q input ports and the displayed I and Q data values. The I and Q input ports feed into a digital receiver that does digital tuning and filtering. The I and Q data seen by the user (either on the display or through SCPI) corresponds to the real ("I") and the imaginary ("Q") output from the digital receiver. When the input path is I+jQ or I Only and the center frequency is 0 Hz the I input ends up in as the real output from the receiver and appears as "I" data. Likewise, when the input path is I+jQ and the center frequency is 0 Hz, the Q input ends up as the imaginary output from the receiver and appears as "Q" data. However, when the input path is Q Only, the Q input is sent to the receiver as $Q+j0$, so the receiver output has the Q input coming out on the real output, and so in Q Only, the signal from the Q input port appears as the "I" data. Another situation where the I and Q data do not necessarily correspond directly to the I and Q inputs is when the center frequency is non-zero. The digital processing involved in the tuning is a complex operation. This will result in I Only data appearing as both "I"

and "Q" data, the same as that signal would appear if seen through the RF input port.

BBIQ is only supported in certain Modes and Measurements in the X-Series. When I/Q is selected in a measurement that does not support it, the "No Result; Meas invalid with I/Q inputs" message appears. This is error 135

Baseband I/Q Remote Language Compatibility

For the Agilent E4406A VSA Series Transmitter Tester, Option B7C provided baseband I/Q inputs. Code compatibility has been provided to allow many of the commands for Option B7C to function properly with X-Series. X-Series has hardware differences and additional capabilities (for example, E4406A does not have independent settings of I & Q nor does it provide for probe calibrations), which make 100% compatibility impossible.

The following commands are supported:

```
:CALibration:IQ:FLATness
:INPut:IMPedance:IQ U50 | B50 | U1M | B1M
:INPut:IMPedance:REFerence <integer>
[:SENSe]:FEED RF | IQ | IONLY | QONLY | AREFERENCE | IFALIGN supports all
parameters except IFALIGN. The FEED? query returns only RF | AIQ | AREF.
```

The following commands are not supported:

```
:CALibration:GIQ
:CALibration:IQ:CMR
:INPut:IQ:ALIGN OFF | ON | 0 | 1
```

The Rohde & Schwarz FSQ-B71 also provides baseband I/Q inputs. A certain amount of code compatibility is provided in X-Series, but hardware differences make this a somewhat limited set.

Supported:

The "<1|2>" is supported as "[1]".

```
INPut<1|2>:IQ:BALanced[:STATE] ON | OFF
INPut<1|2>:IQ:TYPE I | Q | IQ
INPut<1|2>:IQ:IMPedance LOW | HIGH
```

Not Supported:

```
DIAGnostic<1|2>:SERvice:IQ:CALibration:DC 0 | 0.1 | 0.178 | 0.316 | 0.562 |
1.0
DIAGnostic<1|2>:SERvice:IQ:CALibration:DESTination IHIGH | ILOW | QHIGH |
QLOW
DIAGnostic<1|2>:SERvice:IQ:CALibration:PULSE: PRATE 10 kHz | ... | 4 MHz
```

```

DIAGnostic<1|2>:SERvice:IQ:INPut IQ | GND | CALDc | CALPulse
INPut<1|2>:SElect AIQ | RF
TRACe<1|2>:IQ:DATA:FORMat COMPatible | IQBLock | IQPair>
TRACe<1|2>:IQ:DATA:MEMory? <offset samples>,<# of samples>
TRACe<1|2>:IQ:DATA?
TRACe<1|2>:IQ:SET <filter type>,<rbw>,<sample rate>,<trigger
source>,<trigger slope>,<pretrigger samples>,<# of samples>
TRACe<1|2>:IQ:SRATe 10.0kHz to 81.6MHz
TRACe<1|2>:IQ[:STATe] ON | OFF

```

The Rohde & Schwarz FMU has the following SCPI, which is *not* supported (these commands start/abort the probe calibration procedure, which is manually interactive from the front panel):

```

CALibration:ABORt
CALibration:PROBe[:START]

```

6.2.2 RF Input Port

Specifies the RF input port used. Only appears on units with multiple RF inputs, and lets you switch between the inputs.

Instruments that include multiple RF Input ports include:

- SP900S
- N9000B (CXA)
- N9048B (PXE)
- VXT and EXM
- M8920A
- E7760B

NOTE

Switching input ports may change the receiver performance of the instrument.

See "[More Information](#)" on page 3000

Remote Command	<code>[:SENSe]:FEED[:RF]:PORT[:INPut] <port></code> <code>[:SENSe]:FEED[:RF]:PORT[:INPut]?</code>
Example	<code>:FEED:RF:PORT RFIN</code>

6 Input/Output
6.2 Input

Uses the port labeled RF Input when the selected input is RF

:FEED:RF:PORT RFIN2

Uses the port labeled RF Input 2 when the selected input is RF

Notes

<port> is defined as follows:

UXA/PXA/MXA/EXA/CXA/MXE/PXE/NFA (see "Parameters for UXA/PXA/MXA/EXA/CXA/MXE/PXE/NFA" on page 3000):

RFIN	RF Input
RFIN2	RF Input 2
ERFIN	External RF

EXM (see "Parameters for EXT, EXF and EXM Wireless Test Sets" on page 3001):

RFIO1	RFIO 1
RFIO2	RFIO 2
RFIO3	RF3 I/O
RFIO4	RF4 I/O

VXT (see "Parameters for VXT SP900B/11A/15A/16A and SP900B Vector Transceivers" on page 3001):

RFIN	RF Input
RFFD	RFIO FD
RFHD	RFIO HD, Half Duplex

VXT/EXM with Remote Radio Head (for example, M1740A) and/or CIU (for example, E7770A) (see "Parameters for VXT SP900B/11A/15A/16A and EXM when used with Radio Heads/CIU" on page 3002):

RRHhRFHDp	Head <i>h</i> , RF Tx/Rx <i>p</i> , for example RRH1RFHD2 = Head 1, RF Tx/Rx 2
IFINn	DUT IF IN for Channel <i>n</i> , for example IFIN1 = DUT IF IN for Channel 1
IFHDn	DUT IF In/Out for Channel <i>n</i> , for example IFHD1 = DUT IF In/Out for Channel 1

E7760B (see "Parameters for E7760B Wideband Transceiver" on page 3005):

An	Bank A, Channel <i>n</i> , for example A1
Bn	Bank B, Channel <i>n</i> , for example B1
IFION	IF In/Out for Channel <i>n</i> , for example IFIO1

M8920A (see "Parameters for M8920A Radio Test Set" on page 3006):

ANT	Ant
TR	T/R

UXM (see "Parameters for UXM Wireless Test Set" on page 3007):

	RFIN	RF Input
	RFIO1	RFIO 1
	RFIO2	RFIO 2
Dependencies	<p>Only appears when RF Input is selected as the Input</p> <p>Only appears in models that support multiple inputs. If the SCPI command is sent with unsupported parameters in any other model, an error is generated, -221, "Settings conflict; option not installed"</p> <p>When any input is selected in a measurement that does not support it, the "No result; Meas invalid with this input" error condition occurs, and the measurement returns invalid data when queried</p>	
Couplings	<p>When switching between inputs, you may find the new input has a different frequency range than the current input. This means the frequency at the new input may be limited, depending on where you were tuned</p> <p>When you switch from an input whose maximum frequency is greater than the input to which you are switching:</p> <ol style="list-style-type: none"> 1. If the current Stop Freq is below the Max Freq for the new input, then neither Stop Freq or Start Freq needs to change 2. But if the current Stop Freq is above the Max Freq for the new input, Stop Freq must change; so it is set to the Max Freq for the new input 3. If the Stop Freq is forced to change then, if possible, the Span is preserved with the new Stop Freq; however the Start Freq can't go below zero <p>Example: Input 2 has a Max Freq of 110 GHz and Input 1 has a Max Freq of 52 GHz</p> <p>Case 1: Input 2 is selected and Start Freq=40 GHz, Stop Freq=60 GHz. Change to Input 1. Stop Freq changes to 52 GHz so, to preserve Span, Start Freq is set to 32 GHz</p> <p>Case 2: Input 2 is selected and Start Freq=40 GHz, Stop Freq=110 GHz. Change to Input 1. Stop Freq changes to 52 GHz. Span was 70 GHz but new Span maximum is 52 GHz so Start Freq is set to 0 Hz</p> <p>Case 3: Input 2 is selected and Start Freq=10 GHz, Stop Freq=20 GHz. Change to Input 1. No change is necessary, Start Freq and Stop Freq don't change</p>	
Preset	<p>Unaffected by Mode Preset, but set to RFIN on Restore Input/Output Defaults or Restore System Defaults -> All, unless noted in the platform-specific sections below</p>	
State Saved	<p>Saved in instrument state</p>	
Annotation	<p>Annotation in the Meas Bar reads as follows:</p> <p>When input is RF In: Input: RF</p> <p>When input is RF In 2: Input: RF2</p>	
Backwards Compatibility SCPI	<p>:INPut<1 2>:TYPE INPUT1 INPUT2</p> <p>:INPut<1 2>:TYPE?</p> <p>Included for R&S ESU compatibility. In MXE, the INPUT1 parameter is aliased to RFIN and the INPUT2 parameter is aliased to RFIN2</p>	

More Information

In models with two inputs, the second input usually has a different maximum frequency than the first input. For your convenience, the actual “Max Freq” value is allowed to go slightly higher than the nominal Max Freq for the second input, just as is the case with the first input.

Model	Nominal Input 2 Max Freq	Absolute Input 2 Max Freq	Transition rule for switching from Input 1 to Input 2
N9038A	1 GHz	1.000025 GHz	If Stop Freq is above 1.000025 GHz, it is set to 1.000025 GHz, otherwise it does not change If Start Freq is above 1.000024990 Hz, Start Freq is set to 1.000024990 Hz and Span to 10 Hz, otherwise nothing changes
N9000A with option C75	1.5 GHz	1.58 GHz	If Stop Freq is above 1.58 GHz, it is set to 1.58 GHz, otherwise it does not change If Start Freq is above 1.579999990 GHz, Start Freq is set to 1.579999990 GHz and Span to 10 Hz, otherwise nothing changes

Parameters for UXA/PXA/MXA/EXA/CXA/MXE/PXE/NFA

When using the UXA/PXA/MXA/EXA/CXA/MXE/PXE/NFA instruments, the following should be noted:

Example	<pre>:FEED:RF:PORT RFIN</pre> sets the RF input to be RF Input <pre>:FEED:RF:PORT RFIN2</pre> sets the RF input to be RF Input 2 if that port exists <pre>:FEED:RF:PORT ERFIN</pre> sets the RF input to be External RF if the V3050A unit is connected
Dependencies	If the command is sent with RFIN2 or ERFIN and that port does not exist, an error is generated, -221, “Settings conflict; option not installed”
Couplings	Connecting a V3050A changes the Preset to ERFIN and automatically switches the input to ERFIN . Disconnecting the V3050A changes the Preset back to RFIN and automatically switches the input to RFIN
Preset	ERFIN when V3050A is connected, otherwise RFIN
Annotation	Annotation in the Meas Bar reads as follows: <ul style="list-style-type: none"> - When input is RFIN: Input: RF - When input is RFIN2: Input: RF2

- When input is ERFIN: Input: Ext RF

Parameters for EXT, EXF and EXM Wireless Test Sets

(see also "Parameters for VXT SP900B/11A/15A/16A and EXM when used with Radio Heads/CIU" on page 3002)

When using EXT, EXF or EXM, the following should be noted:

Example	<pre><code>:FEED:RF:PORT RFI01</code></pre> <p>sets the RF input to RFIO 1</p> <pre><code>:FEED:RF:PORT RFI02</code></pre> <p>sets the RF input to RFIO 2</p> <pre><code>:FEED:RF:PORT RFI03</code></pre> <p>sets the RF input to RF3 I/O</p> <pre><code>:FEED:RF:PORT RFI04</code></pre> <p>sets the RF input to RF4 I/O</p>
Dependencies	<p>In EXF, or in EXM with hardware M9430A, if RF Input is selected as RF Input Port, you need to choose the settings in the Half Duplex Config menu to determine which port (RFIO3 or RFIO4) will be used</p> <p>In EXM with hardware M9431A, this setting is not supported. If the SCPI command is sent with this setting, an error is generated, -221, "Settings conflict; option not installed"</p>
Preset	<code>RFIO1</code>
Annotation	<p>Annotation in the Meas Bar reads as follows:</p> <ul style="list-style-type: none"> - When input is RFIO1: Input: RFIO1 - When input is RFIO2: Input: RFIO2 - When input is RFIO3: Input: RFIO3 - When input is RFIO4: Input: RFIO4

Parameters for VXT SP900B/11A/

15A/16A and SP900B Vector Transceivers

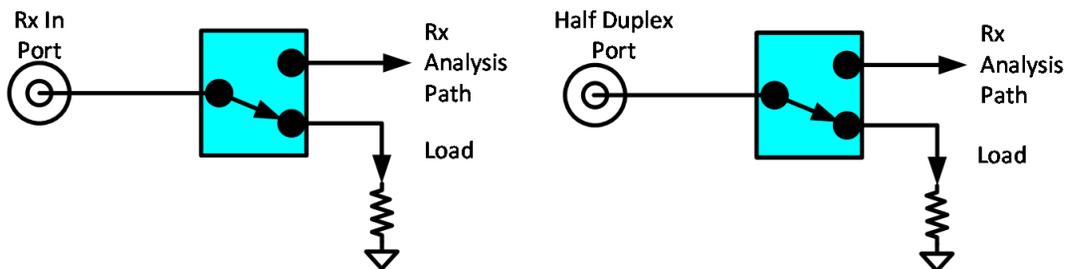

When using VXT models, the following should be noted:

Example	<pre><code>:FEED:RF:PORT RFIN</code></pre> <pre><code>:FEED:RF:PORT RFFD</code></pre> <pre><code>:FEED:RF:PORT RFHD</code></pre> <pre><code>:FEED:RF:PORT NONE</code></pre>
Notes	<p><code>RFIN</code> sets the RF input to be the RF Input port, labeled RF Input</p> <p><code>RFFD</code> sets the RF input to be the full duplex port, labeled RFIO FD. Note that Option "FDX" is required to enable this port</p>

6 Input/Output
6.2 Input

RFHD sets the RF input to be the half duplex port, labeled Half Duplex (SP900B/11A/15A/16A) or RFIO HD (SP900B)

NONE sets the RF In port and Half Duplex port (if HD Port is not set to RF Output) to connect to 50Ω load, as shown below:

When using Source only, set RF Input to **NONE** to provide better isolation. When the input port is set to **NONE**, an error appears in the status area:

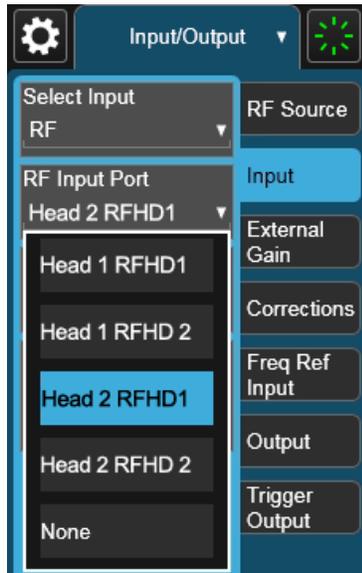

Dependencies	Option HDX is required to enable the Half Duplex (RFIO HD) port Also note that you cannot set this port to be the input if it is already set to be the output. Attempting to do so generates error message: “-221, Settings conflict; RF Input cannot be set to RFIO HD when RF Output is RFIO HD” NONE is not available in VXT model SP900B
--------------	---

Preset	RFIN
--------	-------------

Annotation	Annotation in the Meas Bar reads as follows: When input is RF Input: Input: RF When input is RFIO FD: Input: RFFD When input is RFIO HD or Half Duplex: Input: RFHD When input is None: Input: NONE
------------	---

Parameters for VXT SP900B/11A/15A/16A and EXM when used with RadioHeads/CIU

When using a Remote Radio Head (RRH), such as the Keysight M1740A mmWave Transceiver for 5G, with the VXT or EXM, the choices in the dropdown are dependent on which heads are installed. For example, in the case where two M1740As are present, each with two ports, the dropdown will look like this:

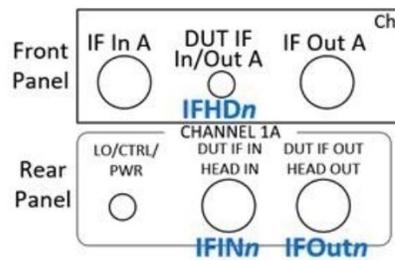

Note the inclusion of the **None** choice, which allows the input port to become unassigned, and thus allows any Output port to be assigned without concern about an Input port conflict. When the input port is unassigned, an error appears in the status area:

The user interface parameter RFHD p corresponds to the port labeled RF Tx/Rx p; for example, RFHD 2 means the port labeled RF Tx/Rx 2 on the M1740A.

When using a E7770A Common Interface Unit, you may make connections to the half-duplex port on the front of the CIU labeled DUT IF In/Out, and/or to ports on the rear of the CIU labeled DUT IF IN and DUT IF OUT. For example, if your DUT has an IF Output you will usually connect it to one of the DUT IF IN ports on the rear panel of the CIU. The user interface parameter IFIN n corresponds to the DUT IF IN port for Channel n on the CIU, so you would choose IFIN 1 in the dropdown to connect to the DUT IF IN port for Channel 1, and the corresponding SCPI parameter would be IFIN1. See the figure below:

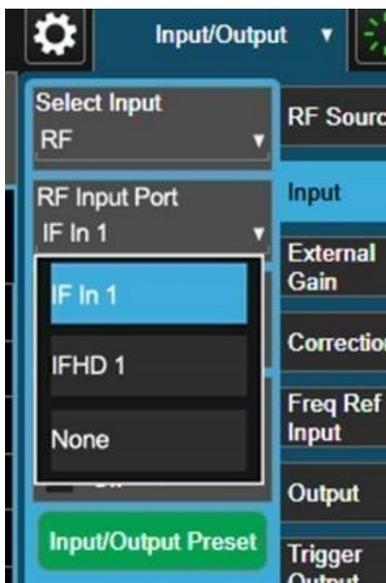

6 Input/Output
6.2 Input

The following table lists the GUI parameter for each input or output on the CIU, and the SCPI parameter for the RF Input Port command (`[:SENSe] :FEED [:RF] :PORT [:INPut]`) and the RF Output Port command (`[:SENSe] :FEED :RF :PORT :OUTPut`):

Port	Port name on CIU	Name displayed in GUI	SCPI parameter for RF Input Port and Output Port commands
IF input port	DUT IF IN	IF In n	<code>IFINn</code> , for example <code>IFIN1</code>
IF output port	DUT IF OUT	IF Out n	<code>IFOutn</code> , for example <code>IFO1</code>
IF port, half duplex	DUT IF In/Out	IFHD n	<code>IFHDn</code> , for example, <code>IFHD1</code>

NOTE The value of *n* for each port, in the multiple-port use case, may vary according to your system configuration. For the value of *n* for your use case, consult the Startup Guide for your particular system (for example S9100A).

An example of the GUI for the CIU ports appears below:

Example `:FEED:RF:PORT RRH1RFHD2`
sets the RF input to be the port labeled RF Tx/Rx 2 on Head 1
`:FEED:RF:PORT IFIN1`
sets the RF input to be the Channel 1 port labeled DUT IF IN on the CIU

Notes The SCPI parameter `RRHhRFHDp` corresponds to **Head h**, port **RF Tx/Rx p**; for example, `RRH1RFHD2` = the port labeled RF Tx/Rx 2 on **Head 1**
For the CIU, the parameter `IFINc` corresponds to the **DUT IF IN** for channel *c*. For example, `IFIN1` would connect to the **DUT IF IN** port for Channel 1

Dependencies	The Radio Head and CIU parameters only appear when a Remote Radio Head or CIU is connected to the instrument. If these parameters are sent at any other time, an error is generated, “-221, Settings conflict; option not installed”
Preset	RRH1RFHD1
Annotation	<p>Annotation in the Meas Bar reads as follows: Input:Hd <i>h</i> RFHD <i>p</i> For example, in the case above, with RFHD 2 on Head 1 selected: Input:Hd 1 RFHD 1 When using the CIU:</p> <ul style="list-style-type: none"> - When input is IFIN1: Input: IFIN 1 - When input is IFIN2: Input: IFIN 2 - When input is IFIN3: Input: IFIN 3 - When input is IFIN4: Input: IFIN 4
Backwards Compatibility SCPI	<p>:FEED:RF:PORT A1 A1 is treated as RRH1RFHD1 and sets the RF input to be the port labeled RF Tx/Rx 1 on Head 1 :FEED:RF:PORT B1 B1 is treated as RRH1RFHD2 and sets the RF input to be the port labeled RF Tx/Rx 2 on Head 1 :FEED:RF:PORT IFIO2 IFIO2 is treated as IFIN1, and sets the IF input to be the port labeled “DUT IF In/Out” on the CIU rear panel</p>

Parameters for E7760B Wideband Transceiver

When using E7760B, the following should be noted:

Example	<p>:FEED:RF:PORT A1 sets the RF input to A1 :FEED:RF:PORT B3 sets the RF input to B3 :FEED:RF:PORT IFIO1 sets the RF input to IFIO1</p>
Dependencies	<p>Ports A1, A2, A3, B1, B2, and B3 are available if Option RF3 is installed. Ports IFIO1 and IFIO2 are available if option RF2 is installed. Note that for the E7760B:</p> <ul style="list-style-type: none"> - Attempting to select a port for which the option is not present will generate the error, -241, “Hardware missing; Input not available” - A port cannot be selected as an Input while it is occupied as an Output. Sending such a command while the port is occupied generates error: -221, “Settings conflict; Input Port is not available while occupied by Output”

6 Input/Output
6.2 Input

- The mmWave ports are divided into two banks; the A Bank and the B Bank. A port cannot be selected as an Input if any port on the same bank is occupied as an Output. Sending a command for this situation generates error: -221 "Settings conflict; Input Port is not available while port bank is occupied by Output"

If RF3 is present and RF4 is absent, a mmWave port cannot be selected as an Input if the Output Port is occupied by mmWave Transceiver with a different frequency range. Sending a command for this situation generates error: -221 "Settings conflict; Input Port is not available while occupied by Output of incompatible frequency"

Preset For E7760B with Option RF2, the Preset value is **IFIO1**
For E7760B without Option RF2, the Preset value is the first port with mmWave Transceiver attached. If no mmWave Transceiver attached: **NONE**

Annotation Annotation in the Meas Bar reads as follows:

- When input is A1: Input: A1
- When input is A2: Input: A2
- When input is A3: Input: A3
- When input is B1: Input: B2
- When input is B2: Input: B2
- When input is B3: Input: B3
- When input is IFIO1: Input: IFIO1
- When input is IFIO2: Input: IFIO2

Parameters for M8920A Radio Test Set

When using the M8920A, the following should be noted:

Example **:FEED:RF:PORT ANT**
sets the RF input to be the Antenna port on M9470A, labeled **Ant**
:FEED:RF:PORT TR
sets the RF input to be the T/R port on M9470A and M8920A, labeled **T/R**. Note that Option HDX is required to enable the T/R port

Dependencies **ANT** and **TR** are only available in modular analyzers, and only when the M9470A module is installed, such as in M8920A. Option HDX is required to enable the T/R port

Preset **ANT**

Annotation Annotation in the Meas Bar reads as follows:

- When input is Ant: Input: Ant
- When input is T/R: Input: T/R

Parameters for UXM Wireless Test Set

For UXM, note the following:

Example	<code>:FEED:RF:PORT RFIN</code> sets the RF input to be RF Input <code>:FEED:RF:PORT RFIO1</code> sets the RF input to RFIO 1 <code>:FEED:RF:PORT RFIO2</code> sets the RF input to RFIO 2
Preset	<code>RFIN</code>

6.2.3 SA Frequency Extender Firmware Update (Front Panel Only)

When a Frequency Extender device (for example, V3050A) is connected and selected, if a firmware update is available for that device, this control will be visible. Because the measurement will be stopped for the duration of the firmware update, and because the update cannot be un-done, a confirmation dialog will be presented before proceeding with the firmware update. The update can take some time, so while in process, a modal dialog will be shown indicating that the update is in process and warning not to disconnect the device or turn off power. Typically, the update will take about a minute, but time can vary with the model of the Frequency Extender. When complete, the modal dialog will be dismissed, and a pop-up message will be shown for a few seconds indicating the success or failure of the update.

See ["Error Messages" on page 3007](#)

Notes	Measurement is stopped while the update is in process
Dependencies	Not available unless an External RF device is connected, External RF is the selected RF Input Port, and there is a firmware update available for the device

Error Messages

Update Already in Process Error

If a firmware update is already in process, the following message is displayed:

```
Another external device FW update is already in process. Only one update is allowed at a time
```

If received, wait until the current FW update is complete and then try again if still needed.

Unknown Assembly Error

6 Input/Output
6.2 Input

When updating the firmware, the target hardware assembly needs to be identified. If for some reason the assembly cannot be identified, the firmware will not be able to initiate the update, and this error message will be displayed:

```
Error updating FW for external device model <model number>' serial number <serial number>
```

```
Could not find HW assembly, cannot perform FW update
```

The <model number> and <serial number> contain the actual numbers for the device.

This is a failure that warrants investigation, so you should contact Keysight Customer Support for service.

Error During Firmware Update Process

If there is an execution problem during the FW update, the specific error message(s) is written to the SA Event Log and this error message is displayed:

```
Error updating FW for external device model <model number>' serial number <serial number>
```

```
Error during FW update. See windows event log for more details
```

The <model number> and <serial number> contain the actual numbers for the device.

6.2.4 SA Frequency Extender Cable Correction

An SA Frequency Extender, such as V3050A, is attached to the instrument with several cables. Keysight provides several cables for purchase with the frequency extender. Typically, these are 1-, 2-, or 3-meter cables for the RF and IF connections. Keysight has characterized these cables and can correct for their loss. This control allows you to specify which cable is being used.

If you are using another type of cable, the instrument *cannot* automatically correct for it, so this function must be set to **OFF**. In this case, you can use RCal to characterize the corrections.

Remote Command	<code>:INPut:FEXtender:CABLe:CORRection OFF V3050A1M V3050A2M V3050A3M</code>
Example	<code>:INP:FEXT:CABL:CORR V3050A1M</code>
Notes	The RF Input Port selections that support an SA Frequency Extender (such as V3050A) are: SP900S: External RF No other instruments support an SA Frequency Extender
Dependencies	An SA Frequency Extender must be attached, and the frequency extender's port must be the selected input for this control to be visible <ul style="list-style-type: none">- If the instrument does not support frequency extenders, the SCPI command returns error -241, "Hardware missing; option not available"

- If the instrument does support frequency extenders, but a frequency extender is not attached, the SCPI command returns error -241, "Hardware missing; Cable selection only available when supporting frequency extender attached"

When a frequency extender is attached, the control is not visible unless the frequency extender's port is the selected RF input, but the command will still be available. Setting the cable selection when the frequency extender's port is not active has no effect until the port is selected

Preset	Unaffected by Mode Preset but set to preset value by Restore Input/Output Defaults or Restore System Defaults -> All
State Saved	Saved in instrument state

6.2.5 Half Duplex Input Port

Specify whether **RFIO3** or **RFIO4** is the Half Duplex Input port.

Remote Command	<code>[:SENSe]:HDUPlex:PORT:INPut RFIO3 RFIO4</code>
Example	<code>:HDUPlex:PORT:INPut RFIO3</code> <code>:HDUPlex:PORT:INPut?</code>
Dependencies	Only appears in EXM If RFIO3 is selected as "Half Duplex Output Port", then "Half Duplex Input Port" will be set to RFIO4 automatically. If RFIO4 is selected as "Half Duplex Output Port", then "Half Duplex Input Port" will be set to RFIO3 automatically
Preset	RFIO3
State Saved	Saved in State

6.2.6 Port Information (Remote Command Only)

Provides information about an instrument port. The return information consists of two comma-separated fields:

- Field 1: the connection status (0 or 1)
- Field 2: a string of port information

The return information is device-dependent.

Remote Command	<code>[:SENSe]:FEED[:RF]:PORT:INFormation? RFIN RFIN2 RFFD RFHD A1 A2 A3 B1 B2 B3 IFIO1 IFIO2 ANT TR</code>
Example	<code>:FEED:PORT:INF? A1</code> example = <code>1,"US56160060"</code> where <code>1</code> is the connection status and <code>"US56160060"</code> is the port information
Notes	For E7760B: The connection status (first field in the return value) indicates:

0	– the port is either not licensed for use or is not connected to a mmWave Transceiver
1	– the port is licensed; and for the case of mmWave ports, the port is connected to a mmWave Transceiver
	The port information (second field in the return value) contains:
	"" (empty string) – no applicable information
	Serial Number – the serial number of the connected mmWave Transceiver
	If you send an incompatible parameter, the return values are: 0,""

Dependencies	Only valid for E7760B
--------------	-----------------------

6.2.7 RF Preselector

In models that support the RF Preselector, such as PXE (N9048B), allows you to turn the preselector on or off.

NOTE When using the RF Preselector, if your measurement starts below 3.6 GHz and finishes above 3.6 GHz, the preselector bypass switch will have to switch in and out for every measurement. When this is the case, you will hear a clicking sound from the instrument and a warning message will be displayed: “Settings Alert: Mechanical switch cycling”. You are advised to *avoid* such setups as much as possible, to minimize switch wear. Pressing **Mode Preset** resets Stop Freq to 3.6 GHz, to exit this state, or you can manually set Stop Freq to be below 3.6 GHz.

Remote Command	<code>[:SENSe]:POWer[:RF]:RFPSelector[:STATe] 1 0 ON OFF</code> <code>[:SENSe]:POWer[:RF]:RFPSelector[:STATe]?</code>
Example	<code>:POW:RFPS 1</code> <code>:INP:PRES:STAT ON</code>
Notes	Set full compliance measurement: <code>[:SENSe]:POWer[:RF]:RFPSelector[:STATe] 1 ON</code> Set pre-compliance measurement: <code>[:SENSe]:POWer[:RF]:RFPSelector[:STATe] 0 OFF</code>
Dependencies	Only appears when RF Input is selected as the Input Only appears in MXE and PXE The RF Preselector is not available in all measurements. The key is grayed out in measurements that do not support it, unless you are in a Mode in which no measurements support it, in which case the key does not appear at all. If the preselector is unavailable, it is forced to Off. Attempting to turn it on or off in measurements that do not support it generates the error message: -221, Settings conflict; Feature not supported for this measurement The RF Preselector is not available when FFT Sweep Type is manually selected. Attempting to turn it on or off when this is the case generates an error message: -221, Settings conflict; RF Presel unavailable when Sweep Type=Manual FFT

	<p>Only appears in Modes that support the RF Preselector, in other Modes, sending the SCPI command or query generates an error</p> <p>In Frequency Scan measurement, this key is grayed-out when final measurement is running. Warning message “Function not available while measurement is running” appears if the grayed-out key is pressed</p>
Preset	ON
Annotation	When RF Preselector=On, “RF PRESEL” is displayed on the Settings Panel
Backwards Compatibility SCPI	<p><code>:INPut<1 2>:PRESelection[:STATe] ON OFF</code></p> <p><code>:INPut<1 2>:PRESelection[:STATe]?</code></p> <p>Included for R&S ESU compatibility</p>

6.2.8 Notch Filter

In some models that support the RF Preselector, such as PXE, there is also a notch filter to suppress signals in the frequency band from 2.4 GHz to 2.5 GHz. This control allows you to turn the notch filter on or off.

Remote Command	<p><code>[:SENSe]:POWer[:RF]:RFPSelector:NFIltEr[:STATe] OFF ON 0 1</code></p> <p><code>[:SENSe]:POWer[:RF]:RFPSelector:NFIltEr[:STATe]?</code></p>
Example	<p><code>:POW:RFPS:NFIL 1</code></p> <p><code>:POW:RFPS:NFIL?</code></p>
Dependencies	<p>Only appears when RF Input is selected as the Input</p> <p>Only appears in models that support the notch filter, such as PXE. Attempting to turn it on or off via SCPI in models that do not support it generates error message: -241 Hardware missing; Not available for this model number</p> <p>Only appears in measurements that support the Notch Filter, such as EMI Receiver measurements. Attempting to turn it on or off via SCPI in measurements that do not support it generates error message: -221, Settings conflict; Feature not supported for this measurement</p> <p>In Frequency Scan measurement, this control is grayed-out when final measurement is running, aligned with the RF Preselector key. The warning message “Function not available while measurement is running” appears if the grayed-out control is pressed</p>
Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON
Annotation	<p>Due to limited space in the Measurement Bar, Notch Filter annotation is shown as part of the RF Presel state</p> <ul style="list-style-type: none"> - RF Presel: On, NF, when both RF Presel and Notch Filter are turned on - RF Presel: On, when RF Presel = on and Notch Filter= off - RF Presel: Off, when RF Presel = off

6 Input/Output
6.2 Input

Backwards	<code>:INPut<1 2>:PRESelection:FILTer:NOTCh[:STATe] ON OFF</code>
Compatibility SCPI	<code>:INPut<1 2>:PRESelection:FILTer:NOTCh[:STATe]?</code>

6.2.9 RF Calibrator

Lets you choose a calibrator signal to look at or turns the calibrator off.

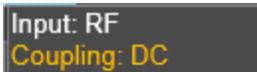

Remote Command	<code>[:SENSe]:FEED:AREFERENCE REF50 REF4800 OFF</code> <code>[:SENSe]:FEED:AREFERENCE?</code>
Example	<code>:FEED:AREF REF50</code> selects the 50 MHz amplitude reference as the signal input <code>:FEED:AREF REF4800</code> selects the 4.8 GHz amplitude reference as the signal input <code>:FEED:AREF OFF</code> turns the calibrator "off" (switches back to the selected input - RF or I/Q)
Dependencies	Only appears when RF Input is selected as the Input Selecting an input (RF, Ext Mix or I/Q) turns the Calibrator OFF . This is true whether the input is selected using the menu panel or <code>[:SENSe]:FEED</code> The 4.8 GHz internal reference is only available in some models and frequency range options. If the 4.8 GHz reference is not present, the 4.8 GHz choice does not show, and if the REF4800 parameter is sent, the instrument generates an error
Couplings	When one of the calibrator signals is selected, the instrument routes that signal (an internal amplitude reference) to the instrument, and changes the main input selection to RF so the calibrator signal can be seen. When you turn the calibrator off it does not switch back to the previously selected input
Preset	OFF
State Saved	Saved in instrument state
Annunciation	An advisory message is sent, indicating that the input is set to internal
Notes	For ESA backwards compatibility In the ESA the calibrator was a separate output which you connected to the input and switched on with this command In X-Series, the ON parameter is aliased to <code>[:SENSe]:FEED:AREF REF50</code> and the OFF parameter is aliased to <code>[:SENSe]:FEED:AREF OFF</code> When <code>:CALibration:SOURce:STATE?</code> is received, 1 is returned if any of the references is selected, or 0 if the Calibrator is OFF
Preset	OFF
Backwards Compatibility SCPI	<code>:CALibration:SOURce:STATE OFF ON 0 1</code> <code>:CALibration:SOURce:STATE?</code>

6.2.10 RF Coupling

Specifies alternating current (**AC**) or direct current (**DC**) coupling at the instrument RF input port. Selecting **AC** coupling switches in a blocking capacitor that blocks any DC voltage present at the instrument input. This decreases the input frequency range of the instrument, but prevents damage to the input circuitry of the instrument if there is a DC voltage present at the RF input.

NOTE

When operating in DC coupled mode, ensure protection of the instrument input circuitry by limiting the DC part of the input level to within 200 mV of 0 Vdc. In AC or DC coupling, limit the input RF power to +30 dBm (1 Watt).

Remote Command	<code>:INPut:COUPling AC DC</code> <code>:INPut:COUPling?</code>
Example	<code>:INP:COUP DC</code>
Dependencies	Only appears when RF Input is selected as the Input Does not appear in models that are always AC coupled. When the SCPI command to set DC coupling is sent to these models, it generates the error "Illegal parameter value; This model is always AC coupled" In these models, <code>:INP:COUP?</code> always returns AC Does not appear in models that are always DC coupled. When the SCPI command to set AC coupling is sent to these models, it generates the error "Illegal parameter value; This instrument is always DC coupled" In these models, <code>:INP:COUP?</code> always returns DC
Preset	AC on models that support AC coupling On models that are always DC coupled, such as millimeter wave models (frequency ranges 30 GHz and above), the preset is DC
State Saved	Saved in instrument state
Annunciation	When the RF Input is selected, and AC coupling is selected, annunciators appear in the Meas Bar to that effect:  appears in the settings panel (the row of annunciators across the top of the display) to that effect, as shown below: When the RF Input is selected, and DC coupling is in effect, the annunciator changes as shown below:  Note the amber color, which indicates that you should exercise caution when applying a signal to any DC coupled input (see note above this table for the specific cautions) On models that support both AC and DC coupling: when DC coupling is selected, a warning condition message appears in the status line "DC coupled" as shown below:

On models that support both AC and DC coupling: when AC coupling is selected, and any part of the displayed frequency range is below 10 MHz, a warning condition message appears in the status line: "AC: Accy unspec'd below 10 MHz"

In AC coupling mode, you can view signals below the corner frequency of the DC block, but below a certain frequency the amplitude accuracy is not specified.

The lowest frequency for which specifications apply is:

X-Series Model	Lowest Freq for meeting specs when AC coupled	Lowest Freq for meeting specs when DC coupled
CXA-503/507	100 kHz	n/a
CXA-C75 Input 2	1 MHz	n/a
CXA-513/526	10 MHz	9 kHz
CXA-m	10 MHz	9 kHz
EXA	10 MHz	9 kHz
MXA	10 MHz	20 Hz
PXA	10 MHz	3 Hz
UXA	10 MHz	3 Hz

Some amplitude specifications apply only when coupling is set to DC. Refer to the appropriate amplitude specifications and characteristics for your instrument.

6.2.11 Input Z Correction

Sets the input impedance for unit conversions. This affects the results when the y-axis unit is voltage or current units (dBmV, dBμV, dBμA, V, A), but not when it is power units (dBm, W). The impedance you select is for computational purposes only, since the actual impedance is set by internal hardware to 50 ohms. Setting the computational input impedance to 75 ohms is useful when using a 75 ohm to 50 ohm adapter to measure a 75 ohm device on an instrument with a 50 ohm input impedance.

There are a variety way to make 50 to 75 ohm transitions, such as impedance transformers or minimum loss pads. The choice of the solution that is best for your measurement situation requires balancing the amount of loss that you can tolerate with the amount of measurement frequency range that you need. If you are using one of these pads/adaptors with the **Input Z Corr** function, you might also want to use the **Ext Gain** key. This function is used to set a correction value to compensate

for the gain (loss) through your pad. This correction factor is applied to the displayed measurement values.

Remote Command	<code>[:SENSe]:CORRection:IMPedance[:INPut][:MAGNitude] 50 75</code> <code>[:SENSe]:CORRection:IMPedance[:INPut][:MAGNitude]?</code>
Example	<code>:CORR:IMP 75</code> sets the input impedance correction to 75 ohms <code>:CORR:IMP?</code>
Couplings	In CXA option C75, when RF Input 2 is selected, the Input Z Correction automatically changes to 75 ohms. You may then change it to whatever is desired. When the main RF Input is selected, the Input Z Correction automatically changes to 50 ohms. You may then change it to whatever is desired
Preset	Unaffected by Preset, but set to 50 ohms by Restore Input/Output Defaults or Restore System Defaults->All Some instruments/options may have 75 ohms available
State Saved	Saved in instrument state

6.2.12 All Screens Use Same Input

If **ON**, then all Screens share the same Input settings. This is the default state.

If **OFF**, then certain settings are allowed to be local to each Screen, meaning one Screen can have them set one way and another can have them set another way.

The Input settings that become local to each Screen when **All Screens Use Same Input** is **OFF** are:

Input Tab:

- Selected Input (RF, Ext Mix, BBIQ)
- RF Input Port (only appears in instruments with multiple RF ports, such as SP900S, MXE, and CXA)
- RF Coupling (AC/DC)
- Input Z Correction

External Gain Tab:

- External Preamp
- MS
- BTS

Corrections Tab:

- For each Correction, whether it is on or off

6 Input/Output
6.2 Input

Note that if **All Screens Use Same Input** is **OFF** and you press the + control to create a new Screen, the new Screen contains a copy of the old Screen's state, including all its Input/Output variables.

Remote Command	:INSTrument:COUPle:SCReen:INPut ON OFF 1 0
Example	:INST:COUP:SCR:INP OFF
Preset	ON

Not affected by **Input/Output Preset**, but set to **ON** by **Restore Input/Output Defaults**

6.2.13 External Mixer Setup

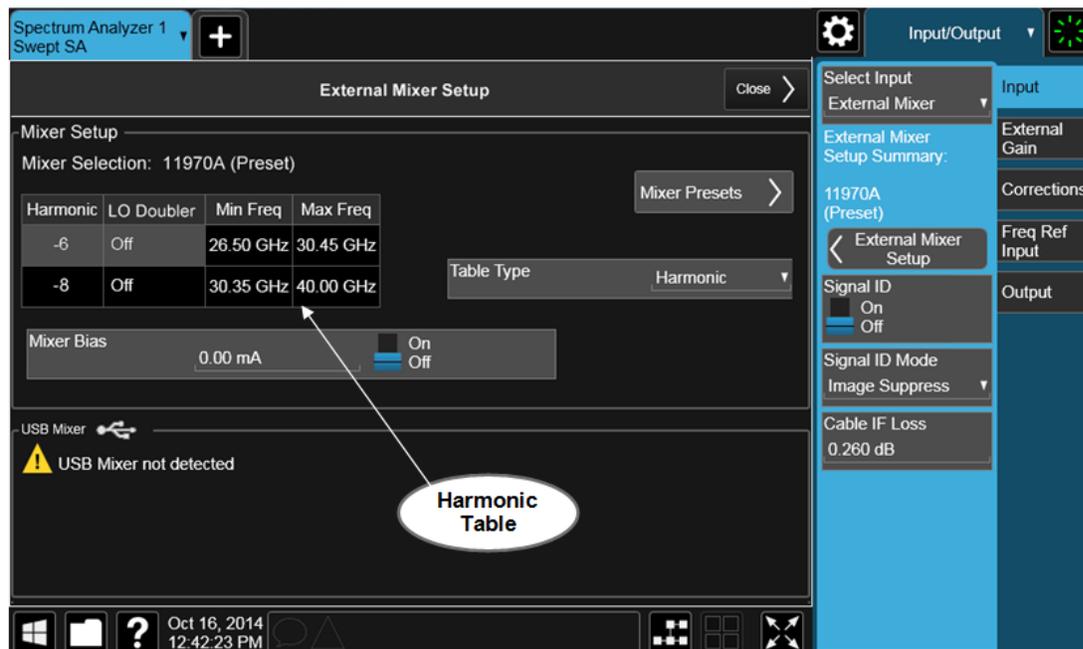

Lets you select the mixer type, and lets you configure your mixer (if necessary). The first page of the dialog shows you the current settings for the selected mixer. These settings may be dependent on which IF path is currently in use, whether a + or – harmonic is currently selected, etc.

To apply any amplitude correction factors needed to correct mixer flatness, you enter values into one of the Correction tables (under **Input/Output, Corrections**). The correction conversion loss values can be extracted from data supplied with the mixer or from manual measurements you make to determine the conversion loss. Note that the correction applied by the Correction tables is global to the instrument; therefore, you should make sure to turn off the External Mixer corrections when you are not using the External Mixer input.

NOTE Keysight USB Mixers automatically supply their flatness data to the instrument, and the correction is applied internally. No correction needs be entered, and the correction does not appear in the user-accessible Corrections tables. You are free to enter additional corrections into the Correction tables under **Input/Output, Corrections**.

Notes	The setup summary on the menu panel appears just above this control, showing the current external mixer setup
Dependencies	Only appears when External Mixer is selected as the Input
State Saved	All settings in the External Mixer Setup dialog are part of the Input/Output system, and hence are saved whenever State is saved

The External Mixer Setup screen looks like this:

The current Mixer selection (the current or most recently connected USB Mixer, or the most recent Mixer Preset, or **Custom** if you have modified the setup) reads out at the top of this screen as **Mixer Selection**

The Harmonic Table currently being used reads out below the Mixer Selection. It shows each range being used for the current mixer. Note that a band may be made up of up to 3 ranges. Each range represents a choice of mixer harmonic and doubler state. When you select a Mixer Preset, it sets the instrument Start and Stop frequency to the values shown in the Harmonic Table; Start Freq is set to the Min Freq for the bottom range, and Stop Freq is set to the Max Freq for the top range. In many cases you can exceed these nominal values; the absolute maximum and minimum frequency for each preset are shown in the tables that accompany the control descriptions for the Mixer Presets.

NOTE

If the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span = Stop Freq - Start Freq), the instrument uses the maximum Span the measurement allows, and sets **Center Frequency** to the midpoint of the Start and Stop Freq values in the Harmonic Table.

You may edit some of the Harmonic and LO Doubler fields in the Harmonic Table, as shown by the gray backgrounds of these fields. When you edit the Harmonic Table, the Mixer Selection changes to **Custom**. To change it back you must go back into the Mixer Presets menu and select a Preset.

When you edit the Harmonic Table, the nominal Min Freq and Max Freq that are available will usually be different than the Preset you were using; and the absolute frequency limits will change as well. This may result in a change to your Start

6 Input/Output

6.2 Input

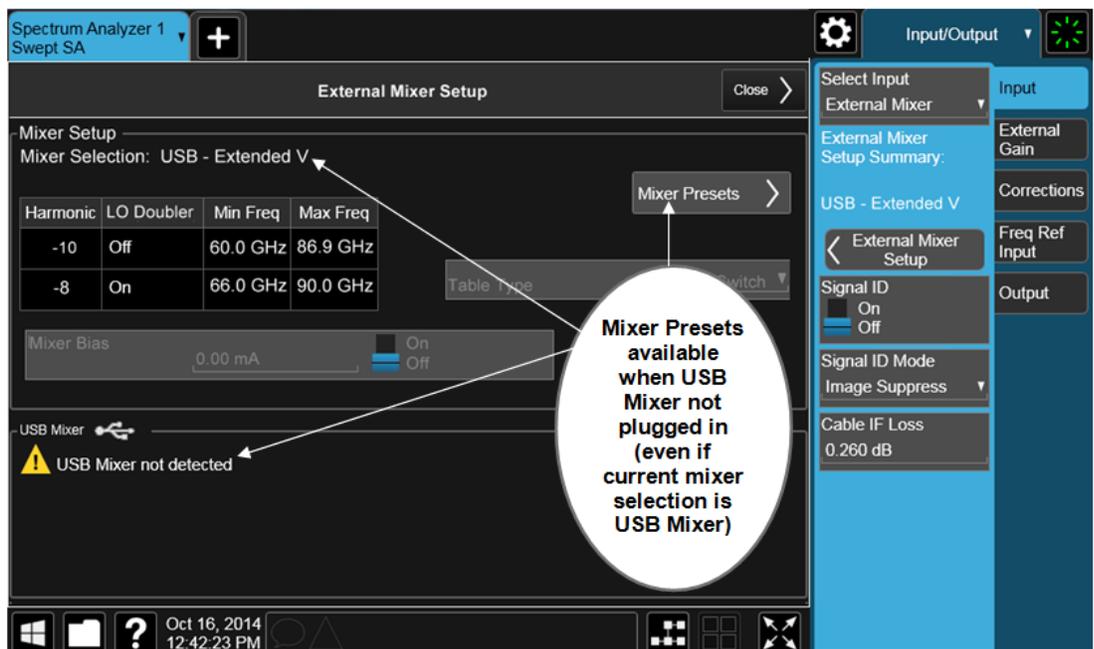

and/or Stop Freq, if the current values fall outside the new range, requiring you to retune your Center Freq to get your signal back in the center.

The instrument supports the Keysight M1970 Series Harmonic Mixers with USB connection. While in External Mixing, if one of these mixers is plugged in to a USB port, it is automatically detected and displayed in the “USB Mixer” area of the setup screen, including its model number and serial number.

The instrument assumes that if you plug a mixer into the USB you want to use that mixer, so:

1. If a USB mixer is connected to the USB port, the Mixer Presets button is grayed-out, as none of the presets make sense with a USB Mixer connected. Note that once the instrument has acquired the USB Mixer, the mixer selection will remain if it is subsequently unplugged from the USB, allowing you to plug it back in with no change to your settings. However, once you unplug it, the Mixer Presets control ceases to be grayed-out, allowing you to preset to a different mixer
2. When Restore Input/Output Defaults is performed, if a Keysight USB Mixer is plugged into the instrument’s USB port, the Mixer Selection remains unchanged
3. When recalling an instrument state, if a Keysight USB Mixer is plugged into the instrument’s USB port, and the Mixer Selection in the recalled state is for a USB Mixer that does not match the mixer currently plugged in, you will have to unplug your mixer and then plug it back in to get the instrument to recognize your mixer

As long as the selection in Ext Mixer Setup shows one of the USB mixers, the **Mixer Bias** control is grayed-out and the Harmonic Table is no longer editable, as shown by the fact that the fields in the Harmonic Table are now black and the **Table Type** control is grayed-out.

Only one USB Mixer is supported at a time. To switch to a different USB Mixer, disconnect the one that is no longer being used prior to connecting a new one.

The Mixer Selection displayed and menu panel readback for the Keysight M1970 series mixers is:

Mixer Model	Mixer Selection display on Setup Screen	Readback
Keysight M1970E: Option 001: 60 to 90 GHz Waveguide Harmonic Mixer	USB - M1970E-001 E-Band	USB Mixer E-Band
Keysight M1971E: Option 001: 60 to 90 GHz Waveguide Harmonic Mixer	USB - M1971E-001 E-Band	USB Mixer E-Band
Keysight M1971E: Option 003: 55 to 90 GHz Waveguide Harmonic Mixer	USB - M1971E-003 Extended E-Band	USB Mixer Extended E
Keysight M1971V: Option 001: 50 to 75 GHz Waveguide Harmonic Mixer	USB - M1971E-001 V-Band	USB Mixer V-Band
Keysight M1971W: Option 001: 75 to 110 GHz Waveguide Harmonic Mixer	USB - M1971E-001 W-Band	USB Mixer W-Band
Keysight M1970V Option 001: 50 to 75 GHz Waveguide Harmonic Mixer	USB - M1970V-001 V-Band	USB Mixer V-Band
Keysight M1970V Option 002: 50 to 80 GHz Waveguide Harmonic Mixer	USB - M1970V-002 Extended V-Band	USB Mixer Extended V
Keysight M1970W Option 001: 75 to 110 GHz Waveguide Harmonic Mixer	USB - M1970W-001 W-Band	USB Mixer W-Band

The Keysight USB mixer essentially acts as a “remote front end” and is fully calibrated over the specified frequency range, without requiring any user interaction. This is particularly useful at high mm-wave frequencies, where cable loss is typically quite large, and it is desirable to bring the front end right up to the device under test, rather than bringing the mm-wave signal to the instrument using a lossy and uncalibrated cable or waveguide connection.

Connecting the mixer to the USB port on the instrument switches you to External Mixing, aborts the current measurement, and initiates an alignment of the mixer. A popup message, “USB Mixer connected” appears on the display. When a USB mixer and the LO/IF cable are connected the alignment is performed. When the alignment begins, an “Aligning” popup replaces the previous message on the display. When the alignment completes, the current measurement restarts.

6.2.13.1 Mixer Presets

Presets the mixer setup for the particular type of mixer that you are using.

These presets are divided into four groups:

- One for legacy HP/Agilent/Keysight mixers (11970)
- Three for general purpose mixers:
 - presets that use a single harmonic and no doubling
 - presets that use a single harmonic but double the LO
 - presets that use multiple harmonics

Note that the IF/LO port provides a 3.8-14 GHz LO in two bands: 3.8-8.7 (LO fundamental), and 8.6-14 GHz (doubled LO).

In most cases, once you have executed the preset, you will not need to adjust any further settings.

Remote Command	<pre>[:SENSe]:MIXer:BAND A Q U V W NA ND NE NF NG NJ NK NQ NU NV NW NY NEXT DD DF DG DJ DK DQ DV DW DY DEXT MA ME MU MCOAX USB VDIWR6PT5M4 [:SENSe]:MIXer:BAND?</pre>
Example	<pre>:MIX:BAND A :MIX:BAND?</pre>
Notes	<p>A Q U V W select HP/Agilent/Keysight 11970 mixer presets NA ND NE NF NG NJ NK NQ NU NV NW NY NEXT select single harmonic, non-doubled LO presets DD DF DG DJ DK DQ DV DW DY DEXT select single harmonic, doubled LO presets MA ME MU MCOAX select multiple harmonic presets VDIWR6PT5M4 selects presets for the VDI WR6.5CCD-M4 external mixer (a Compact Down-Converter in the Keysight N9029ACST Series) VDIWR6PT5M4 requires Model SP900S with the EXW option. To use this selection, you must connect cables from the external mixer to the High LO Out and High IF In ports (not the Ext Mixer port) of the SP900S All of these presets are detailed in their respective control descriptions The query returns the most recent preset, <i>unless</i> the harmonic table has been edited after the preset was executed. If the harmonic table has been edited, returns CUSTOM The command USB refreshes the USB mixer connection and automatically detects the mixer band. The query returns the following if a Keysight USB Mixer is plugged into the instrument's USB port:</p>

USB E	Keysight E-Band USB Mixer
USB V	Keysight V-Band USB Mixer
USB VEXT	Keysight Extended V-Band USB Mixer
USB W	Keysight W-Band USB Mixer

Note that the parameters **CUSTOM**, **USB V**, **USB VEXT**, and **USB W** are query responses only, and cannot be sent to the instrument

The following cross-reference matches the mixer band designators used by Keysight to the EIA waveguide designations:

EIA	Keysight	Freq Range
WR-28	A	26.5 - 40 GHz
WR-22	Q	33 - 50 GHz
WR-19	U	40 - 60 GHz
WR-15	V	50 - 75 GHz
WR-12	E	60 - 90 GHz
WR-10	W	75 - 110 GHz
WR-8	F	90 - 140 GHz
WR-6	D	110 - 170 GHz
WR-5	G	140 - 220 GHz
WR-3	J	220 - 325 GHz

Preset When **Restore Input/Output Defaults** is performed, an “A” mixer preset is also issued (11970A band), unless a Keysight USB Mixer is plugged into the instrument’s USB port, in which case the Mixer Selection remains unchanged

When using Keysight USB Mixers, if **Restore All Defaults (:SYSTEM:DEFault)** has been performed, either remove and reinsert the USB cable or press the **Refresh USB Mixer Connection** control

VDI CCD (N9029)

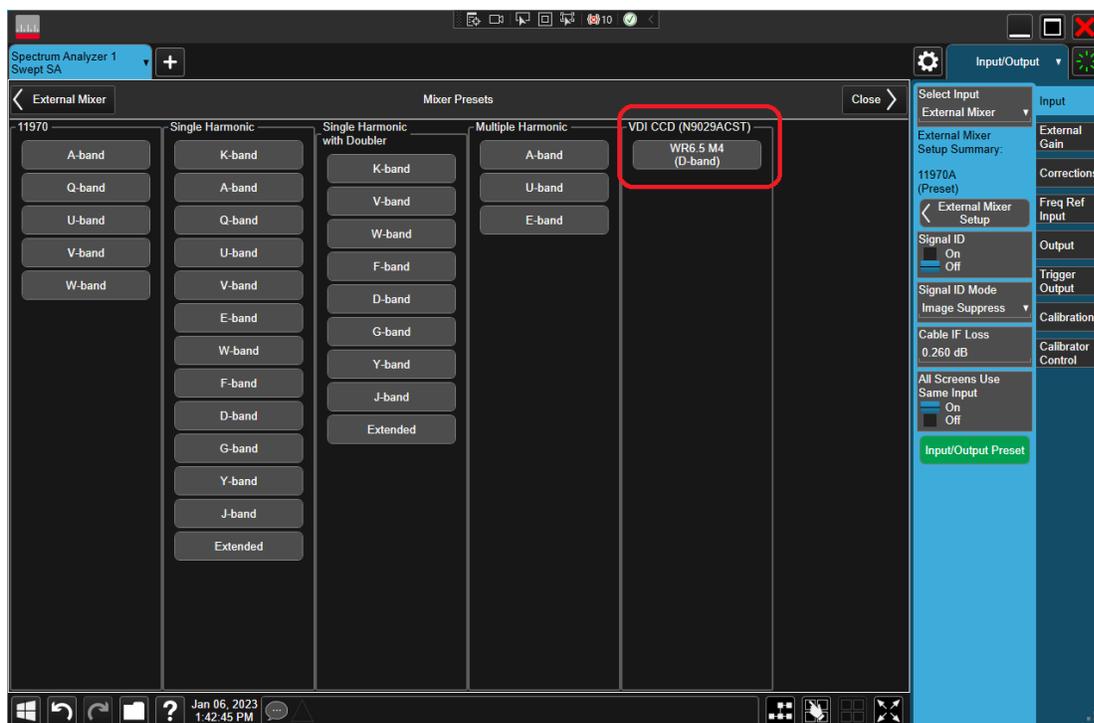

These presets select a setup that uses a single harmonic and no LO doubling.

This setup is used with an external mixer in the series VDI CCD (N9029ACST). The currently supported example is the D-band mixer VDI WR6.5CCD-M4.

Mixer	Readout on setup dialog and menu panel	Harm #	RF start	RF stop	RF center
WR6.5 M4 (D-band)	VDI WR6.5CCD-M4	-4	110	170	140

This mixer setup is enabled only for model SP900S with the EXW option. You must connect cables from this external mixer to the High LO Out and High IF In ports (not the Ext Mixer port) of the SP900S, as illustrated below:

6 Input/Output
6.2 Input

11970

Allows you to preset for a model in the HP/Agilent/Keysight 11970 series.

Because the X-Series has an LO range of 3.8 - 14 GHz, and older analyzers had an LO range of 3.0 - 6.8 GHz, the harmonic numbers used in the X-Series may differ from those used on older analyzers for the same mixers. Additionally, some of the 11970 mixers cannot be operated over their full range with the X-Series without switching harmonics. Consequently, you will find that some of the bands (A-Band, for example) are broken into two ranges for use with the X-Series.

Below are the 11970A presets. The 11970U and the 11970W use a single harmonic. The other three switch harmonic mid-band. Both harmonic ranges are shown in the table. None of these mixers use LO doubling.

The 11970 K-band mixer and the 11974 preselected mixer series are not supported.

Preset	Readout on setup dialog and menu panel	Range	Harm #	RF start	RF stop	RF center
A-band	11970A	1	-6	26.5	30.45	28.475
		2	-8	30.35	40	35.175
Q-band	11970Q	1	-8	33	40.8	36.9
		2	-10	39.8	50	44.9
U-band	11970U	..	-10	40	60	50
V-band	11970V	1	-12	50	66	58
		2	-14	53	75	64
W-band	11970W	..	-18	75	110	92.5

Single Harmonic

These presets select a setup that uses a single harmonic and no doubling for the LO.

Mixer	Readout on setup dialog and menu panel	Harm #	RF start	RF stop	RF center
K-band	K-band Single Harmonic, no doubler	-4	18	26.5	22.25
A-band	A-band Single Harmonic, no doubler	-6	26.5	40	33.25
D-band	D-band Single Harmonic, no doubler	-20	110	170	140
E-band	E-band Single Harmonic, no doubler	-12	60	90	75
F-band	F-band Single Harmonic, no doubler	-18	90	140	115
Q-band	Q-band Single Harmonic, no doubler	-6	33	50	41.5
U-band	U-band Single Harmonic, no doubler	-8	40	60	50
V-band	V-band Single Harmonic, no doubler	-10	50	75	62.5
W-band	W-band Single Harmonic, no doubler	-14	75	110	92.5

6 Input/Output
6.2 Input

Mixer	Readout on setup dialog and menu panel	Harm #	RF start	RF stop	RF center
	no doubler				
G-band	G-band Single Harmonic, no doubler	-26	140	220	180
Y-band	Y-band Single Harmonic, no doubler	-30	170	260	215
J -band	J-band Single Harmonic, no doubler	-38	220	325	272.5
Extended	Extended Single Harmonic, no doubler	-40	155	345	250

Single Harmonic with doubler

These presets select a setup that uses a single harmonic and doubling for the LO.

Mixer	Readout on setup dialog and menu panel	Harm #	RF start	RF stop	RF center
D-band	D-band Single Harmonic w/doubler	-14	110	170	140
F-band	F-band Single Harmonic w/doubler	-10	90	140	115
G-band	G-band Single Harmonic w/doubler	-16	140	220	180
J-band	J-band Single Harmonic w/doubler	-24	220	325	272.5
K-band	K-band Single Harmonic w/doubler	-2	18	26.5	22.25
Q-band	Q-band Single Harmonic w/doubler	-4	33	50	41.5
V-band	V-band Single Harmonic w/doubler	-6	50	75	62.5
W-band	W-band Single Harmonic w/doubler	-8	75	110	92.5
Y-band	Y-band Single Harmonic w/doubler	-20	170	260	215
Extended	Extended Single Harmonic w/doubler	-28	245	390	317.5

Multiple Harmonics

These presets select a setup that uses multiple harmonics and may or may not use doubling for the LO.

Mixer	Readout on setup dialog and menu panel	Range	Harm #	Dblr?	RF start	RF stop	RF Center
A-band	A-band	1	-4	N	26.5	34.1	30.3
	Multiple Harmonic	2	-4	Y	33.1	40	36.55
E-band	E-band	1	-6	Y	60	83	71.5
	Multiple Harmonic	2	-8	Y	65	90	77.5
U-band	U-band	1	-6	N	40	51.5	45.75
	Multiple Harmonic	2	-6	Y	49.5	60	54.75
Coaxial	Coaxial	1	-4	N	26.5	34	30.25
	Multiple Harmonic	2	-4	Y	32.5	55	43.75
		3	-6	Y	50	70	60

6.2.13.2 Mixer Bias

Adjusts an internal bias source for use with external mixers. The bias signal is present on the center conductor of the IF input connector on the front panel. The shunt current range is from -10 mA to 10 mA and it can be set whether Mixer Bias state is On or Off, but it will only be applied if it is On.

The bias remains as set if you switch to another input (for example, the RF Input).

Remote Command	<pre>[:SENSe]:MIXer:BIAS <real> [:SENSe]:MIXer:BIAS? [:SENSe]:MIXer:BIAS:STATe OFF ON 0 1 [:SENSe]:MIXer:BIAS:STATe?</pre>
Example	<pre>:MIX:BIAS 0 :MIX:BIAS? :MIX:BIAS:STAT 0 :MIX:BIAS:STAT?</pre>
Preset	Unaffected by Preset, but set to OFF (0) by Restore Input/Output Defaults OFF
State Saved	Saved in instrument state
Min	-10 mA
Max	10 mA
Annunciation	When the bias is turned on this (together with the bias polarity) is indicated in the Meas Bar with a

plus or minus sign:

 otherwise it reads "Off"

6.2.13.3 Table Type

Determines the Custom Mixer configuration type. You can choose: Single Row, Harmonic Switching, or Doubler Switching. For details, see ["Available Types" on page 3026](#).

The Harmonic Table can be configured as:

- A single row (meaning only one harmonic number is used and the LO Doubler is either on or off)
- Two rows where the harmonic number switches between the first row and the second
- Two rows where the LO Doubler state switches between the first row and the second

Available Types

Table Type	Behavior
Single Row	The External Mixer always stays in the same Harmonic Number and the LO Doubler is either on or off and does not change state during a sweep. You may change the Harmonic Number and you may change the state of the Doubler
Harmonic Switching	The External Mixer switches the Harmonic Number in the middle of the sweep. The LO Doubler may be on or off, but it is the same for both Harmonic Numbers. You can set the initial Harmonic Number, and when it switches it decrements by two when the harmonic is negative and increments by two when the harmonic is positive For example, if you set the initial number to -6, when it switches it will go to -8. If you set the harmonic number to 8, when it switches it will go to 10
Doubler Switching	The External Mixer switches the doubler from Off to On in the middle of the sweep. You can set the Harmonic Number, but it stays the same for the Doubler Off state as for the Doubler On state. The LO Doubler control is grayed-out in this table type

Editable Fields

Table Type	Fields you can edit
Single Row	Harmonic and LO Doubler cells
Harmonic Switching	Harmonic and LO Doubler cells (only the first row)
Doubler Switching	Harmonics cell (only the first row)

Note that you cannot add or delete rows from the table; you can only modify the rows that are already there.

Remote Command	<code>[:SENSe]:MIXer:TTYPe SINGle HARMonic DOUBLer</code> <code>[:SENSe]:MIXer:TTYPE?</code>
Example	<code>:MIX:TTYP SING</code>
Couplings	When you change the Table Type, the Mixer Selection changes to Custom
Preset	Depends on the current Mixer Preset. Unaffected by Mode Preset , but Restore Input/Output Defaults presets the Mixer to 11970A, for which the Table Type is Harmonic Switching
State Saved	Saved in instrument state

6.2.13.4 Harmonic

Lets you enter the **Harmonic** value with its associated sign (mixing mode). Only the first row of the table is editable. When you edit a value or change "Table Type" on [page 3026](#), the Mixer Selection changes to **Custom**.

In **Custom** mode, the maximum start and stop frequencies are strictly set by the LO range and the harmonic number you have chosen. The undoubled LO range is approximately 3.8 – 8.7 GHz, and (for LOs that support doubling) the doubled range is approximately 8.0 – 14.0 GHz. That range times the harmonic you have selected determines the tuning range. If your frequency is currently outside that range when you edit the Harmonic Table, the frequency will be changed to fall at the edge of the range. To change it back, go to the **Mixer Presets** menu and select a Preset.

The harmonic number is a signed integer, where the sign distinguishes between positive and negative mixing products. Desired mixing products occur at an IF frequency that equals the difference between the RF frequency (f_{RF}) and the LO frequency (Nf_{LO}). When this difference is positive, we can say $f_{IF} = f_{RF} - Nf_{LO}$. When this difference is negative, we can say $f_{IF} = Nf_{LO} - f_{RF}$. Thus, a negative harmonic means the instrument will be tuned such that the harmonic of the LO is higher than the indicated frequency by the frequency of the first IF. A positive harmonic means the instrument will be tuned such that the harmonic of the LO is lower than the indicated frequency by the frequency of the first IF.

Remote Command	<code>[:SENSe]:MIXer:HARMonic <integer></code> <code>[:SENSe]:MIXer:HARMonic?</code>
Example	<code>:MIX:HARM -28</code> <code>:MIX:HARM?</code>
Notes	The query returns the harmonic value of the first row of the harmonic table
Couplings	When you set a value for Harmonic via SCPI, the Mixer Selection changes to Custom
Preset	Unaffected by Mode Preset , but Restore Input/Output Defaults turns editing off, the Harmonic Table returns to normal, and the Mixer is preset to 11970A, which has -6 in the first row of its Harmonic Table

State Saved	Saved in instrument state
Min	-400
Max	400

6.2.13.5 LO Doubler

Lets you specify whether the Doubler is on or off. Only the first row of the table is editable, and the LO Doubler field is only editable in Single Row and Harmonic Switching table types. When you edit a value or change the Table Type, the Mixer Selection changes to **Custom**.

The LO Doubler setting controls the choice of the LO doubler state for LO's that support doubled operation. In Single Row mode it is either on or off for the one row in the table. In Harmonic Switching mode it is on for both rows or off for both rows. In Doubler switching it is off for row 1 and on for row 2, so it is not editable.

In LOs that support doubling, the fundamental band is approximately 3.8 – 8.7 GHz, and the doubled band is approximately 8.0 – 14 GHz. The higher LO frequency can result in a lower mixer harmonic and reduced mixer conversion loss.

Remote Command	<code>[:SENSe]:MIXer:LODoubler ON OFF 0 1</code> <code>[:SENSe]:MIXer:LODoubler?</code>
Example	<code>:MIX:LOD 0</code> <code>:MIX:LOD?</code>
Notes	The query returns the doubler value of the first row of the harmonic table
Dependencies	Grayed-out and set to OFF when " Table Type " on page 3026 is set to Doubler Switching Grayout message: "-221 Settings conflict; Function unavailable while Table Type=Doubler Switching"
Couplings	When you set a value via SCPI, the Mixer Selection changes to Custom
Preset	Unaffected by Mode Preset , but Restore Input/Output Defaults turns off editing, the Harmonic Table returns to normal, and the Mixer is preset to 11970A, which has the doubler Off in the first row of its Harmonic Table
State Saved	Saved in instrument state

6.2.13.6 Refresh USB Mixer Connection

Re-reads the USB devices and refreshes connection to Keysight USB mixers. This operation is the same as physically removing and reinserting the mixer's USB connection.

Example	<code>:MIX:BAND USB</code>
Notes	When using Keysight USB Mixers, if Restore All Defaults (:SYSTEM:DEFault) has been performed, either remove and reinsert the USB cable or press Refresh USB Mixer Connection

6.2.14 Mixer Path

Determines which path you wish to use when using M1971 series USB mixers:

- **NORMa1**, in which they function as a classic external mixer with a single conversion
- **DUAL** Conversion, in which the first conversion is to a higher IF frequency (nominally 1.5 GHz) and you provide a 10 MHz signal to which an internal PLL is locked, to effect a second downconversion. The higher IF frequency used in Dual Conversion increases the image frequency offset, giving you a wider image-free conversion range. This reduces aliasing effects and improves the image suppress functionality for wideband signals
- **AUX** Equipment, wherein the first mixer output drives an output connector on the mixer and the instrument is out of the circuit. When you connect an M1971 Mixer to USB, the instrument will pull the IF and RF flatness data from the USB mixer and write this data to a user-accessible file in CSV format for your use when Aux Equipment is selected

Remote Command	<code>[:SENSe]:MIXer:MPATH NORMa1 DUAL AUX</code> <code>[:SENSe]:MIXer:MPATH?</code>
Example	<code>:MIX:MPAT NORM</code>
Dependencies	<p>Only appears when an M1971 series Mixer is connected to the USB port of the instrument</p> <p>When AUX Equipment is the selection, Sig Id is turned off to avoid shifting the LO. It is <i>not</i> turned back on when a different path is selected</p> <p>When AUX Equipment is the selection, there is no valid result, so the instrument displays a “No Result; Meas invalid with Aux Equip” error condition message (error 135)</p> <p>DUAL Conversion is grayed-out unless in the Swept SA measurement. If grayed-out and the command is sent, generates error:“-221, Settings Conflict; Dual Conversion mixer path is only available in Swept SA”</p> <p>If in DUAL Conversion and you exit Swept SA, reverts to NORMa1 setting. If you subsequently return to Swept SA, does <i>not</i> automatically return to DUAL Conversion</p> <p>When DUAL Conversion is selected, if no signal is sensed at the 10 MHz input port, an error condition is generated, “Ref missing or out of range; M1971” (error 521). This also lights the Error LED on the mixer itself</p>
Couplings	When AUX path is selected, the instrument switches to Zero Span
Preset	NORMa1
State Saved	Saved in instrument state
Annotation	<p>In the Meas Bar, if an M1971 series Mixer is connected to the USB port of the instrument, the field Mixer Path appears and says:</p> <ul style="list-style-type: none"> – Normal for Normal

-
- 2xConv for Dual Conversion
 - Aux for Aux Equipment

6.2.15 User IF Freq

Specifies the desired IF frequency when using the **AUX** Equipment path. This setting determines the LO frequency that the instrument will drive into the mixer to correspond to the specified center frequency. Note that the **AUX** Equipment path *a/ways* uses “Negative Mixing”, that is, the LO frequency is always higher than the RF frequency.

Remote Command	<code>[:SENSe]:MIXer:UIFFreq <real></code> <code>[:SENSe]:MIXer:UIFFreq?</code>
Example	<code>:MIX:UIFF 300 MHz</code>
Dependencies	Only appears if an M1971 mixer is connected to USB and the Mixer Path is AUX Equipment
Preset	1.2 GHz
State Saved	Saved in Input/Output state
Min	0 GHz
Max	4 GHz

6.2.16 Signal ID On/Off

Toggles the Signal ID (signal identification) function On or Off. This function lets you identify multiple responses of a single input signal that are generated when using un-preselected external mixers. The use of mixers without pre-selecting filters offers the advantage of improved receiver sensitivity because of the absence of the filter insertion loss, but results in multiple responses due to images and undesired harmonic mixing products.

While in **Signal ID**, basic spectrum analyzer functions work normally (for example, you can change Span normally), but some functions are disabled (for example, some traces are unavailable).

There are two forms of **Signal ID**, Image Suppress and Image Shift. Choose the one most appropriate for your application. For Image Shift, an LO-shifted and an unshifted trace are taken in Trace 1 and Trace 2 and displayed together. Any peaks that are not the same in both traces are images. For Image Suppress, image cancellation is performed in the background using two hidden traces, and the result is displayed in Trace 1, which shows only the valid signals.

When **Signal ID** is **ON**, this is indicated in the Meas Bar as Signal ID: On. The annotation is displayed in amber to alert you, because it can cause unexpected behavior if you are not aware that it is on.

Remote Command	<code>[:SENSe]:SIDentify[:STATe] OFF ON 0 1</code> <code>[:SENSe]:SIDentify[:STATe]?</code>
Example	<code>:SID 0</code> <code>:SID?</code>
Notes	Signal ID uses data from two successive sweeps. Therefore, if the instrument is in single sweep mode, two sweep triggers are used to generate the data needed for signal identification For the Log Plot measurement in the Phase Noise Mode, Signal ID works only in the segment of LO sweeping where the offsets are greater than the Rejection Offset setting. When turning it on, you may notice a discontinuity in the Phase Noise trace at the Rejection Offset setting frequency by a few dB due to the under response inherent to Signal ID
Dependencies	Only appears when External Mixer is selected as the Input Not available in some measurements. If Signal ID does not appear or is grayed-out while in your measurement, then it is not available Because Signal ID uses data from two successive sweeps, several trace and sweep functions are grayed-out in Signal ID . See the documentation for your measurement for details on which trace functions are grayed-out Not available with Signal Track, in which case Signal ID is grayed-out Turned off when External Mixer is turned off. Signal ID cannot be turned on when using internal mixing Rules for auto coupling of the Sweep and FFT controls are changed with Signal IDON . For both the dynamic range case and the speed case, swept is chosen whenever any form of Signal ID is on. If Manual FFT is selected, Signal ID is grayed-out If Signal ID is selected in a measurement that does not support it, a warning message is generated
Couplings	The Auto Rules for detector selection select Normal for all active traces when Signal ID is turned ON
Preset	Unaffected by Preset, but set to OFF by Restore Input/Output Defaults
Annunciation	When Signal ID is on this is indicated in the Meas Bar as Signal ID: On. The annotation is displayed in amber color to alert you to the fact that Signal ID is on, as it can cause unexpected behavior if you are not aware that it is on

6.2.17 Signal ID Mode

Determines the **Signal ID** mode to use, either Image Suppress or Image Shift.

Image Suppress

Mathematically removes all image and multiple responses of signals present at the mixer input. Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression

effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals, others are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

NOTE

When changing from Image Shift to Image Suppress mode, Trace 2 is blanked, as it was used for Image Shift and contains data that you will probably not want to see in Image Suppress

Image Shift

Like the Image Suppress mode, Image Shift is a two-sweep sequence. The data from the first sweep is placed in Trace 1 and the data from the second (LO frequency shifted by $2 * IF / N$) sweep is placed in Trace 2. On alternate sweeps, the alternate trace (trace 2) is placed in front of trace 1. This way, you can see a signal at the same place on alternate sweeps, showing in yellow (trace1) and blue (trace2). Signal responses of Trace 1 and Trace 2 that have the same horizontal position are considered to be in the current band and therefore can be analyzed with the amplitude and frequency measurement systems of the SA. All other responses are invalid and should be ignored.

NOTE

This function takes control of and uses Trace 1 and Trace 2. Any data in these traces prior to activating Image Shift will be lost.

Remote Command	<code>[:SENSe]:SIDentify:MODE ISUPpress ISHift</code> <code>[:SENSe]:SIDentify:MODE?</code>
Example	<code>:SID:MODE ISUP</code> <code>:SID:MODE ISH</code> <code>:SID:MODE?</code>
Dependencies	Only appears when External Mixer is selected as the Input
Preset	Unaffected by Preset, but set to ISUPpress by Restore Input/Output Defaults
State Saved	Saved in instrument state

6.2.18 Cable IF Loss

The loss at the IF in the IF/LO cable can be compensated for with this function, by entering the loss in dB for your cable.

The cable loss will depend on the IF frequency. The IF frequency varies depending on which IF path your measurement is using. For best accuracy, characterize your cable's loss for the IF frequency or frequencies you will be using.

IF Frequencies

10 MHz path	322.5 MHz
25 MHz path	322.5 MHz
40 MHz path	250 MHz
140 MHz path	300 MHz

Remote Command	<code>[:SENSe] :MIXer :CIFLoss <rel_amp1></code> <code>[:SENSe] :MIXer :CIFLoss?</code>
Example	<code>:MIX :CIFL 0.23 DB</code> <code>:MIX :CIFL?</code>
Dependencies	Only appears when External Mixer is selected as the Input
Preset	0.26 dB
State Saved	Saved in instrument state
Min	-100
Max	100

6.2.19 I/Q Path

Selects which I/Q input channels are active. The LED next to each I/Q input port will be on when that port is active.

The analysis bandwidth for each channel is the same as that of the instrument. For example, the base N9020A has a bandwidth of 10 MHz. With I/Q input the I and Q channels would each have an analysis bandwidth of 10 MHz, giving 20 MHz of bandwidth when the I/Q Path is I+jQ. With option B25, the available bandwidth becomes 25 MHz, giving 25 MHz each to I and Q and 50 MHz to I+jQ.

I/Q voltage to power conversion processing is dependent on the I/Q Path selected:

- With I+jQ input, we know that the input signal may not be symmetrical about 0 Hz, because it has a complex component. Therefore, above 0 Hz only the positive frequency information is displayed, and below 0 Hz only the negative frequency information is displayed
- With all other Input Path selections, the input signal has no complex component and therefore is always symmetrical about 0 Hz. In this case, by convention, the power conversion shows the combined voltage for both the positive and negative frequencies. The information displayed below 0 Hz is the mirror of the

6 Input/Output
6.2 Input

information displayed above 0 Hz. This results in a power reading 6.02 dB higher (for both) than would be seen with only the positive frequency voltage. Note also that, in this case the real signal may have complex modulation embedded in it, but that must be recovered by further signal processing

Remote Command	<code>[:SENSe]:FEED:IQ:TYPE IQ IONLy QONLy</code> For option details, see More Information <code>[:SENSe]:FEED:IQ:TYPE?</code>
Example	Set the input to be both the I and Q channels, combined as $I + j * Q$: <code>:FEED:IQ:TYPE IQ</code> Set the input to be only the I channel: <code>:FEED:IQ:TYPE IONL</code> Set the input to be only the Q channel: <code>:FEED:IQ:TYPE QONL</code> Turn on both I and Q channels and treat I as channel 1 and Q as channel 2: <code>:FEED:IQ:TYPE IND</code>
Dependencies	Only appears when I/Q is the selected input
Preset	<code>IQ</code>
State Saved	Yes Unaffected by Preset, but set to the default value by Restore Input/Output Defaults or Restore System Defaults->All
Notes	For R&S FSQ-B71 compatibility
Preset	<code>IQ</code>
Backwards Compatibility SCPI	<code>:INPut[1]:IQ:TYPE IQ I Q</code> <code>:INPut[1]:IQ:TYPE?</code>

More Information

I+jQ

Sets the signal input to be both the I and Q channels. The I and Q channel data will be combined as $I + j * Q$.

I Only

Sets the signal input to be only the I channel. The Q channel will be ignored. The data collected is still complex. When the center frequency is 0 the imaginary part will always be zero, but for any other center frequency both the real and imaginary parts will be significant.

Q Only

Sets the signal input to be only the Q channel. The I channel will be ignored. The Q channel will be sent to the digital receiver block as $Q+j0$. The receiver's output is still complex. When the center frequency is 0 the imaginary part will always be zero, but for any other center frequency both the real and imaginary parts will be significant. Note that since the receiver's real output is displayed as the "I" data, when the center frequency is 0, the Q Only input appears as the "I" data.

6.2.20 Reference Z

Sets the value of the impedance to be used in converting voltage to power for the I and Q channels. This does not change the hardware's path impedance (see "Input Z" on page 3036).

Remote Command	<code>:INPut:IMPedance:REFerence <integer></code> <code>:INPut:IMPedance:REFerence?</code>
Example	Set the I/Q reference impedance to 50 Ω <code>:INP:IMP:REF 50</code>
Dependencies	Only appears when I/Q is the selected input
Preset	50 Ω
State Saved	Yes Unaffected by a Preset, but set to the default value by Restore Input/Output Defaults or Restore System Defaults->All
Min/Max	1 Ω - 1 M Ω

6.2.21 I/Q Setup

Allows you to set up and calibrate various parameters for the I/Q inputs.

Dependencies	Only appears when I/Q is the selected input
--------------	---

6.2.21.1 I Setup

Accesses the channel setup parameters for the I channel.

Differential

Selects differential input on or off for the I channel. For differential input (also called balanced input), the instrument uses both main and complementary ports. When differential input is off (also called single-ended or unbalanced input), the instrument uses only the main port.

Remote	<code>:INPut:IQ[:I]:DIFFerential OFF ON 0 1</code>
--------	--

6 Input/Output
6.2 Input

Command	<code>:INPut:IQ[:I]:DIFFerential?</code>
Example	Put the I channel in Differential mode: <code>:INP:IQ:DIFF ON</code> Put the I channel in Single Ended mode: <code>:INP:IQ:DIFF OFF</code>
Notes	When I Differential Input = On, the instrument checks for attenuation mismatches between the I and I-bar ports. If the difference in attenuation values exceeds 0.5 dB, a Settings Alert error condition, error 159 is set When I Differential Input = On, and IQ Path is I+jQ, the Q Differential input must also be On. Similarly, when I Differential Input = Off, and IQ Path is I+jQ, the Q Differential input must also be Off. If the states of the two inputs do not match, an error condition message is generated, 159, Settings Alert; I/Q mismatch: Differential
Couplings	Some active probes include built-in differential capability. When one of these probes is sensed, this key is disabled. Since the differential capability is handled in the probe, the Instrument will use only the main port and the key will show that the Instrument's Differential Input mode is Off (indicating that the complementary port is not in use) When Q Same as I is On, the value set for I will also be copied to Q
Preset	OFF (Single Ended) Unaffected by Mode Preset, but set to the default value by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Yes
Annotation	The LED on the I-bar port indicates the Differential Input setting
Notes	For R&S FSQ-B71 compatibility, with no independent settings for the I and Q channels. Therefore, it is tied only to the I channel and does not provide an equivalent for the Q channel. For proper operation of the backwards compatibility command, Q Same as I should be ON
Preset	OFF
Backwards Compatibility SCPI	<code>:INPut[1]:IQ:BALanced[:STATE] OFF ON 0 1</code> <code>:INPut[1]:IQ:BALanced[:STATE]?</code>

Input Z

Selects the input impedance for the I channel. The impedance applies to both the I and I-bar ports.

The input impedance controls the hardware signal path impedance match. It is not used for converting voltage to power. The voltage to power conversion always uses the Reference Z parameter. The Reference Z parameter applies to both I and Q channels.

Remote Command	<code>:INPut[1]:IQ[:I]:IMPedance LOW HIGH</code> <code>:INPut[1]:IQ[:I]:IMPedance?</code>
----------------	--

Example	Set the I channel input impedance to 1 M Ω : <code>:INP:IQ:IMP HIGH</code> Set the I channel input impedance to 50 Ω : <code>:INP:IQ:IMP LOW</code>
Notes	LOW = 50 Ω , HIGH = 1 M Ω When IQ Path is I+jQ, the I Input Z setting must be the same as the Q Input Z setting. If the settings of the two inputs do not match, an error condition message is generated, 159; Settings Alert; I/Q mismatch: Input Z
Couplings	Input impedance is a built-in characteristic of a probe. Therefore, whenever a probe is sensed, this key is disabled, and the value is set to match the probe When no probe is sensed on Q and Q Same as I is On, the value set for I will also be copied to Q
Preset	LOW Unaffected by Mode Preset, but set to the default value by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Yes
Annotation	"I:<I Input Z>" (examples, "I:50 Ω " or "I:1M Ω ") in the Measurement Bar. The annotation shows both the I and Q Input Z values

Skew

Sets the skew factor for the I channel. The skew will shift the channel's data in time. Use this to compensate for differences in the electrical lengths of the input paths due to cabling.

Remote Command	<code>[:SENSe]:CORRection:IQ[:I]:SKEW <seconds></code> <code>[:SENSe]:CORRection:IQ[:I]:SKEW?</code>
Example	Delay the data for the I channel by 10 ns: <code>:CORR:IQ:SKEW 10 ns</code>
Preset	0
State Saved	Yes Unaffected by Mode Preset, but set to the default value by Restore Input/Output Defaults or Restore System Defaults->All
Range	0 s to 100 ns
Min	0 s
Max	+100 ns

Combined Differential/Input Z (Remote Command Only)

For backwards compatibility only. It combines the Differential Input and Input Z selections into a single command.

6 Input/Output
6.2 Input

Example	<pre>:INPut:IMPedance:IQ U50</pre> <p>This is equivalent to the following two SCPI commands:</p> <pre>:INP:IQ:DIFF OFF</pre> <pre>:INP:IQ:IMP 50</pre>								
Notes	<p>Provided for E4406A code compatibility</p> <p>The enum values translate as follows:</p> <table border="1"> <tr> <td>U50</td> <td>Differential Input = Off, Input Z = 50 Ω</td> </tr> <tr> <td>B50</td> <td>Differential Input = On, Input Z = 50 Ω</td> </tr> <tr> <td>U1M</td> <td>Differential Input = Off, Input Z = 1 MΩ</td> </tr> <tr> <td>B1M</td> <td>Differential Input = On, Input Z = 1 MΩ</td> </tr> </table> <p>Combines the Input Z (50 Ω or 1 M Ω) parameter with the Differential Input (Off = "Unbalanced", On = "Balanced") parameter into a single enumeration</p> <p>This backwards-compatibility command was for an instrument without independent settings for the I and Q channels. Therefore, it is tied only to the I channel and does not provide an equivalent for the Q channel. For proper operation of the backwards-compatibility command, Q Same as I should be set to ON</p> <p>Note also the subtle difference between this command and the backwards-compatibility command for Input Z. The Input Z SCPI has "IQ" before "IMP", while this command has that order reversed</p>	U50	Differential Input = Off, Input Z = 50 Ω	B50	Differential Input = On, Input Z = 50 Ω	U1M	Differential Input = Off, Input Z = 1 MΩ	B1M	Differential Input = On, Input Z = 1 MΩ
U50	Differential Input = Off, Input Z = 50 Ω								
B50	Differential Input = On, Input Z = 50 Ω								
U1M	Differential Input = Off, Input Z = 1 MΩ								
B1M	Differential Input = On, Input Z = 1 MΩ								
Couplings	Does not have an independent parameter, but instead is tied to the Differential Input and Input Z parameters. The coupling for those parameters apply to this command too								
Preset	U50								
Backwards Compatibility SCPI	<pre>:INPut:IMPedance:IQ U50 B50 U1M B1M</pre> <pre>:INPut:IMPedance:IQ?</pre>								

6.2.21.2 I Probe

Access the probe setup parameters for the I channel.

Dependencies	<p>Only appears when I/Q is the selected input</p> <p>The set of I/Q probe setup parameters will change based on the type of probe that is sensed. All probe types have the Attenuation parameter, and all probe types can be calibrated. The remaining parameters are only available for some probe types and will not be shown when not available. The probe type is determined by and reported for only for the I and Q ports, never the I-bar or Q-bar ports. The menu title will be "<ch>: <probe id>", where "<ch>" is either "I" or "Q" and "<probe id>" is the type of probe. For example, for the I Probe setup with an Keysight 1130A probe connected to the I port, the title will be "I: 1130A".</p> <p>Probe calibration data is stored for each probe type for each channel. When no probe is sensed, the probe type "Unknown" is used, and this is also treated like a</p>
--------------	---

probe type with its own calibration data. When a probe is changed, the calibration data for that probe type for that port is restored. An advisory message will be displayed showing the new probe type and the calibration status. The calibration data is stored permanently (survives a power cycle) and is not affected by a Preset or any of the Restore commands. When the probe has EEPROM identification (most newer Keysight probes have this), the calibration data is stored by probe serial number and port, so if you have two probes of the same type, the correct calibration data will be used for each. For probes that do not have EEPROM identification, the calibration data is stored by probe type and port and the instrument cannot distinguish between different probes of the same type. In all cases (with or without EEPROM identification), the calibration data is port specific, so it will not follow a specific probe from port to port if the probe is moved.

The "Unknown" probe type is used whenever no probe is sensed. When no calibration data exists for "Unknown" the latest cable calibration data is used.

Attenuation

The attenuation is part of the calibration data stored with the probe type and is initially the value that was returned by the last calibration. You can modify this value and any changes will be stored with the calibration data and will survive power cycles and presets. When a probe calibration is performed the attenuation value will be overwritten by the calibration.

Remote Command	<code>[:SENSe]:CORRection:IQ:I:ATTenuation:RATio <real></code> <code>[:SENSe]:CORRection:IQ:I:ATTenuation:RATio?</code>
Example	Set the attenuation for the current I probe to 100.00:1: <code>:CORR:IQ:I:ATT:RAT 100</code>
Notes	Each probe type has its own attenuation setting. As probes are changed the attenuation value will reflect the new probe's setting. Changing the attenuation affects only the current probe type's setting and leaves all others unchanged When the IQ Path is I+jQ, the Q probe attenuation setting must match the I Probe attenuation setting within 1 dB. If this is not the case, an error condition message is generated, 159; Settings Alert; I/Q mismatch: Attenuation
Preset	1
State Saved	Saved with probe calibration data. Survives a power cycle and is not affected by Preset or Restore
Min/Max	0.001/10000 This is an alternate form of the SCPI command that allows input as a power instead of a ratio.
Remote Command	<code>[:SENSe]:CORRection:IQ:I:ATTenuation <rel_ampl></code> <code>[:SENSe]:CORRection:IQ:I:ATTenuation?</code>
Example	Set the attenuation for the current I probe type to 100.00:1: <code>:CORR:IQ:I:ATT 20 dB</code>

Min/Max -60 dB /+80 dB

Offset

Some active probes have DC offset capability. When one of these probes is connected, this control will be visible. The signal is adjusted for the DC offset before entering the instrument's port. This allows for removal of a DC offset before reaching the instrument's input port voltage limits. For example, a signal that varies 1 V peak-to-peak with a DC offset equal to the instrument's max input voltage would exceed the input limits of the instrument for half its cycle. Removing the DC offset allows the instrument to correctly process the entire signal.

Remote Command	<code>:INPut:OFFSet:I <voltage></code> <code>:INPut:OFFSet:I?</code>
Example	Remove a DC offset of -0.5 V from the I channel input: <code>:INP:OFFS:I -0.5</code>
Notes	Only some probe types support Offset . For those that do, each probe type has its own Offset setting. As probes are changed, the Offset value will reflect the new probe's setting. Changing Offset affects only the current probe type's setting and leaves all others unchanged
Preset	0 V
State Saved	Saved with probe calibration data. Survives power cycle and is not affected by Preset or Restore
Min/Max	-18 V/+18 V

Coupling

Some probe types allow coupling to reject low frequencies. This filters out the DC component of a signal that is composed of a DC bias plus some AC signal. This control is visible only for probe types that have this capability.

Remote Command	<code>:INPut:COUPling:I DC LFR1 LFR2</code> <code>:INPut:COUPling:I?</code>
Example	Turn off low frequency rejection on the I channel, allowing signals down to DC: <code>:INP:COUP:I DC</code> Turn on low frequency rejection on the I channel for frequencies lower than 1.7 Hz: <code>:INP:COUP:I LFR1</code> Turn on low frequency rejection on the I channel for frequencies lower than 0.14 Hz: <code>:INP:COUP:I LFR2</code>
Notes	Only some probe types support Coupling . For those that do, each probe type has its own Coupling setting. As probes are changed, the Coupling value will reflect the new probe's setting. Changing Coupling affects only the current probe type's setting and leaves all others unchanged

Preset	DC
State Saved	Saved with probe calibration data. Survives a power cycle and is not affected by a Preset or Restore
Range	DC AC 1.7 Hz LFR1 AC 0.14 Hz LFR2

Clear Calibration

Clears the calibration data for the current port and probe. It does not clear the data for other probe types or other ports. If the sensed probe has EEPROM identification, only the data for that specific probe is cleared. After this command has completed, the probe calibration state will be the same as if no probe calibration had ever been performed for the specified channel and probe. The probe attenuation will be the default value for that probe type and the Cable Calibration frequency response corrections will be used. This command is dependent on the Differential Input state. When Differential Input is on, both the data for the probe attached to the main port and the data for the probe attached to the complementary port are cleared. When Differential Input is off, only data for the probe attached to the main port is cleared.

Remote Command	<code>:CALibration:IQ:PROBe:I:CLEar</code>
Example	Clear the calibration data for the I channel and the current probe (with EEPROM identification) or probe type (without EEPROM identification): <code>:CAL:IQ:PROBe:I:CLE</code>

6.2.21.3 Calibrate

Invokes the guided probe calibration. The guided probe calibration is context sensitive and depends on the channel (I or Q) and the Differential Input state. The calibration is only performed on the selected channel. When the Differential control is switched to Differential, both the probe attached to the main port and the probe attached to the complementary port are calibrated. When the Differential control is switched to Single Ended, only the probe attached to the main port is calibrated.

Calibrating the Baseband I/Q ports requires several steps and manual connections. The Guided Calibration will interactively step you through the required steps, displaying diagrams to help with the connections. The steps will vary depending on the setup.

In the Guided Calibration windows, the date and time of the last calibration are displayed. If any of the items listed are displayed in yellow, this indicates that the calibration for that item is inconsistent with the latest calibration, and you should complete the entire calibration process before you exit the calibration. For passive probes with Differential On, any calibration that is more than a day older than the most recent calibration will be displayed with the color amber.

6 Input/Output

6.2 Input

The I/Q probe calibration creates correction data for one of the front panel I/Q channels. When the probe has EEPROM identification, the data is unique to that specific probe. When the probe does not have EEPROM identification, the data will be used for all probes of the same type. The data is also unique to the channel, so calibration data for the I channel will not be used for the Q channel and vice versa.

The guided calibration (front panel only) will show connection diagrams and guide you through the I/Q Isolation Calibration and through calibrating each port. The calibration data for each port is stored separately, so as soon as a port is calibrated that data is saved and will be used. If a user presses "Exit" to exit the calibration process, the data for the port already completed will still be used. It is recommended that a calibration be completed once started, or if exited, that it be properly done before the next use of the probe. The "Next" button will perform the calibration for the current port and then proceed to the next step in the calibration procedure. The "Back" button will return to the prior port in the procedure. Both softkeys and dialog buttons are supplied for ease of use. The dialog buttons are for mouse use and the softkeys for front panel use.

The calibration can also be done via SCPI, but no connection diagrams will be shown. You will need to make the correct connections before issuing each port calibration command. Again, it is recommended that all ports be calibrated at the same time.

For Active probes or when Differential is Off, only the main port is calibrated, otherwise both the main and complementary ports are calibrated.

The instrument state remains as it was prior to entering the calibration procedure except while a port is actually being calibrated. Once a port is calibrated it returns to the prior state. A port calibration is in process only from the time the "Next" button is pressed until the next screen is shown. For SCPI, this corresponds to the time from issuing the CAL:IQ:PROB:I|B|Q|QB command until the operation is complete.

For example, if the prior instrument state is Cal Out = Off, Input = I+jQ, and Differential = Off, then up until the time the "Next" button is pressed the I Input and Q Input LEDs are on and the Cal Out, I-bar Input and Q-bar Input LEDs are off. Once the "Next" button is pressed for the I port calibration, only the Cal Out and I Input LEDs will be on, and the others will be off. When the screen progresses to the next step ("Next" button again enabled), the prior state is restored and only the I Input and Q Input LEDs are on (Cal Out is off again).

I/Q Isolation Calibration

I/Q Isolation Calibration must be run before calibrating any port with either the I/Q Cable Calibration or I/Q Probe Calibration. This calibration is performed with nothing connected to any of the front panel I/Q ports. This is the first step in both the I/Q Cable Calibration and the I/Q Probe Calibration. This dialog appears if the Calibration is being run for the first time. It can also be accessed by pressing Back

from the I Input Cal, the Q Input Cal, or the I/Q Cable Cal. Pressing Next from this dialog runs the calibration

Remote Command	<code>:CALibration:IQ:ISOLation</code>
Example	<code>:CAL:IQ:ISOL</code>
Notes	All front panel I/Q ports must be unconnected
State Saved	No

I/Q Isolation Calibration Time (Remote Query Only)

Returns the last date and time that the I/Q Isolation Calibration was performed.

Remote Command	<code>:CALibration:IQ:ISOLation:TIME?</code>
Example	<code>:CAL:IQ:ISOL:TIME?</code>
Notes	Returns 6 integer values: year, month, day, hour, minute, second. When no calibration has been performed, all values are 0
Annunciation	Guided Calibration, Isolation Calibration, Last Calibration

I Port

The I port calibration is performed with the probe body attached to the front panel's I port and the probe tip connected via an adapter to the Cal Out port. The guided calibration will show a diagram of the required connections.

Remote Command	<code>:CALibration:IQ:PROBe:I</code>
Example	<code>:CAL:IQ:PROB:I</code>
Notes	The I port must be connected to the Cal Out port before issuing the command The calibration data is saved as soon as the port is calibrated and will survive power cycles. It is not reset by any preset or restore data commands
State Saved	No

I Port Probe Calibration Time (Remote Query Only)

Return the last date and time that the I/Q Probe Calibration was performed for a specific port.

Remote Command	<code>:CALibration:IQ:PROBe:I :TIME?</code>
Example	<code>:CAL:IQ:PROB:I:TIME?</code>
Notes	This returns 6 integer values: year, month, day, hour, minute, second. When no calibration has been

performed, all values are 0. The value is specific to both the port and probe, so the value will change as probes are connected or disconnected

I-bar Port

The I-bar port calibration is performed with the probe body attached to the front panel's I-bar port and the probe tip connected via an adapter to the Cal Out port. The I-bar probe calibration is only available for passive probes with Differential On. The guided calibration will show a diagram of the required connections.

Remote Command `:CALibration:IQ:PROBe:IBar`

Example `:CAL:IQ:PROB:IB`

Notes The I-bar port must be connected to the Cal Out port before issuing the command
The calibration data is saved as soon as the port is calibrated and will survive power cycles. It is not reset by any preset or restore data commands

State Saved No

I-bar Port Probe Calibration Time (Remote Query Only)

Return the last date and time that the I/Q Probe Calibration was performed for a specific port.

Remote Command `:CALibration:IQ:PROBe:IBAR:TIME?`

Example `:CAL:IQ:PROB:IBAR:TIME?`

Notes Returns 6 integer values: year, month, day, hour, minute, second. When no calibration has been performed, all values are 0. The value is specific to both the port and probe, so the value will change as probes are connected or disconnected

Annunciation Guided Calibration, Probe Calibration, Last Calibration

6.2.21.4 Q Setup

Access the channel setup parameters for the Q channel.

Dependencies Only appears when I/Q is the selected input

Q Same as I

Many, but not all, usages require the I and Q channels have an identical setup. To simplify channel setup, the Q Same as I will cause the Q channel parameters to be

mirrored from the I channel. That way you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time Q Same as I is turned off the I and Q channel setups will be identical. This does not apply to Probe settings or to parameters that are determined by the probe.

Remote Command	<code>:INPut:IQ:MIRROred OFF ON 0 1</code> <code>:INPut:IQ:MIRROred?</code>
Example	Turn off the mirroring of parameters from I to Q: <code>:INP:IQ:MIRR OFF</code>
Couplings	Only displayed for the Q channel. When Yes, the I channel values for some parameters are mirrored (copied) to the Q channel. However, when a parameter is determined by the type of probe and a probe is sensed, the probe setting is always used and the I channel setting is ignored. The following parameters are mirrored: Differential Input (when not determined by probe) Input Z (when not determined by probe)
Preset	Unaffected by Preset, but set to the default value (Q Same as I set to ON) by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state
Range	OFF ON

Differential

Selects differential input on or off for the Q channel. For differential input (also called balanced input), the instrument uses both the Q and Q-bar ports. When differential input is off (also called single-ended or unbalanced input), the instrument uses only the Q port.

Remote Command	<code>:INPut:IQ:Q:DIFFerential OFF ON 0 1</code> <code>:INPut:IQ:Q:DIFFerential?</code>
Example	Put the Q channel in Differential mode: <code>:INP:IQ:Q:DIFF ON</code> Put the Q channel in Single Ended mode: <code>:INP:IQ:Q:DIFF OFF</code>
Notes	When Differential Input = ON , the instrument checks for attenuation mismatches between the Q and Q-bar ports. If the difference in attenuation values exceeds 0.5 dB a Settings Alert error condition, error 159 will be set When Q Differential Input = ON , and IQ Path is I+jQ, the I Differential input must also be ON . Similarly, when Q Differential Input = OFF , and IQ Path is I+jQ, the I Differential input must also be OFF . If the states of the two inputs do not match, an error condition message is generated, 159; Settings Alert; I/Q mismatch: Differential
Couplings	Some active probes include built-in differential capability. When one of these probes is sensed, this key is disabled. Since the differential capability is handled in the probe, the Instrument will use only the main port and the key will show that the Instrument's Differential Input mode is Off (indicating that the

6 Input/Output
6.2 Input

	complementary port not in use) When a differential probe is not sensed and Q Same as I is On, the value set for I will be copied to Q. This key is disabled when Q Same as I is On
Preset	OFF
State Saved	Yes Unaffected by a Preset, but set to the default value by Restore Input/Output Defaults or Restore System Defaults->All
Range	OFF ON
Annotation	The LED on the Q-bar port indicates the Differential Input setting

Input Z

Selects the input impedance for the Q channel. The impedance applies to both the Q and Q-bar ports.

The input impedance controls the hardware signal path impedance match. It is not used for converting voltage to power. The voltage to power conversion always uses the Reference Z parameter. The Reference Z parameter applies to both I and Q channels.

Remote Command	:INPut[1]:IQ:Q:IMPedance LOW HIGH :INPut[1]:IQ:Q:IMPedance?
Example	Set the Q channel input impedance to 1 M Ω : :INP:IQ:Q:IMP HIGH Set the Q channel input impedance to 50 Ω : :INP:IQ:Q:IMP LOW
Notes	LOW = 50 Ω , HIGH = 1 M Ω When IQ Path is I+jQ, the I Input Z setting must be the same as the Q Input Z setting. If the settings of the two inputs do not match, an error condition message is generated, 159; Settings Alert; I/Q mismatch: Input Z
Couplings	Input impedance is a built-in characteristic of a probe. Therefore, whenever a probe is sensed, this key is disabled, and the value is set to match the probe When no probe is sensed and Q Same as I is On, the value set for I will also be copied to Q. This key is disabled when Q Same as I is On
Preset	LOW
State Saved	Yes Unaffected by a Preset, but set to the default value by Restore Input/Output Defaults or Restore System Defaults->All
Range	50 Ω 1 M Ω
Annotation	"Q:<Q Input Z>" (examples, "Q:50 Ω " or "Q:1M Ω ") in the Measurement Bar. The annotation shows both the I and Q Input Z values

Skew

Sets the skew factor for the Q channel. The skew will shift the channel's data in time. Use this to compensate for differences in the electrical lengths of the input paths due to cabling and probes.

Remote Command	<code>[:SENSe]:CORRection:IQ:Q:SKEW <seconds></code> <code>[:SENSe]:CORRection:IQ:Q:SKEW?</code>
Example	Delay the data for the Q channel by 10 ns <code>:CORR:IQ:Q:SKEW 10 ns</code>
Preset	0
State Saved	Yes Unaffected by a Preset, but set to the default value by Restore Input/Output Defaults or Restore System Defaults->All
Min/Max	0 s/ 100 ns

6.2.21.5 Q Probe

Accesses the probe setup parameters for the Q channel. See "[Combined Differential/Input Z \(Remote Command Only\)](#)" on page 3037.

Dependencies	Only appears when I/Q is the selected input
--------------	---

Attenuation

The attenuation is part of the calibration data stored with the probe type and is initially the value that was returned by the last calibration. You can modify this value and any changes will be stored with the calibration data and will survive power cycles and presets. When a probe calibration is performed the attenuation value will be overwritten by the calibration.

Remote Command	<code>[:SENSe]:CORRection:IQ:Q:ATTenuation:RATio <real></code> <code>[:SENSe]:CORRection:IQ:Q:ATTenuation:RATio?</code>
Example	Set the attenuation for the current Q probe to 100.00:1: <code>:CORR:IQ:Q:ATT:RAT 100</code>
Notes	Each probe type has its own attenuation setting. As probes are changed the attenuation value will reflect the new probe's setting. Changing the attenuation affects only the current probe type's setting and leaves all others unchanged When the IQ Path is I+jQ, the Q probe attenuation setting must match the I Probe attenuation setting within 1 dB. If this is not the case, an error condition message is generated, 159; Settings Alert; I/Q mismatch: Attenuation

6 Input/Output

6.2 Input

Preset	Each probe type has its own default. The default for the "Unknown" probe type is 1:1
State Saved	Saved with probe calibration data. Survives a power cycle and is not affected by Preset or Restore
Min/Max	0.001/10000 This is an alternate form of the SCPI command that allows input as a power instead of a ratio.
Remote Command	<code>[:SENSe]:CORRection:IQ:Q:ATTenuation <rel_ampl></code> <code>[:SENSe]:CORRection:IQ:Q:ATTenuation?</code>
Example	Set the attenuation for the current Q probe type to 100.00:1: <code>:CORR:IQ:Q:ATT 20 dB</code>
Min/Max	-60 dB /+80 dB

Offset

Some active probes have DC offset capability. When one of these probes is connected this control will be visible. The signal is adjusted for the DC offset before entering the instrument's port. This allows for removal of a DC offset before reaching the instrument's input port voltage limits. For example, a signal that varies 1 V peak-to-peak with a DC offset equal to the instrument's max input voltage would exceed the input limits of the instrument for half its cycle. Removing the DC offset allows the instrument to correctly process the entire signal.

Remote Command	<code>:INPut:OFFSet:Q <voltage></code> <code>:INPut:OFFSet:Q?</code>
Example	Remove a DC offset of -0.5 V from the Q channel input: <code>:INP:OFFS:Q -0.5</code>
Notes	Only some probe types support Offset . For those that do, each probe type has its own Offset setting. As probes are changed, the Offset value will reflect the new probe's setting. Changing Offset affects only the current probe type's setting and leaves all others unchanged
Preset	0 V
State Saved	Saved with probe calibration data. Survives power cycle and is not affected by Preset or Restore
Min/Max	-18 V/+18 V

Coupling

Some probe types allow coupling to reject low frequencies. This filters out the DC component of a signal that is composed of a DC bias plus some AC signal. This control is visible only for probe types that have this capability.

Remote Command	<code>:INPut:COUPling:Q DC LFR1 LFR2</code> <code>:INPut:COUPling:Q?</code>
----------------	--

Example	<p>Turn off low frequency rejection on the Q channel, allowing signals down to DC: <code>:INP:COUP:Q DC</code></p> <p>Turn on low frequency rejection on the Q channel for frequencies lower than 1.7 Hz: <code>:INP:COUP:Q LFR1</code></p> <p>Turn on low frequency rejection on the Q channel for frequencies lower than 0.14 Hz: <code>:INP:COUP:Q LFR2</code></p>
Notes	Only some probe types support Coupling . For those that do, each probe type has its own Coupling setting. As probes are changed, the Coupling value will reflect the new probe's setting. Changing Coupling affects only the current probe type's setting and leaves all others unchanged
Preset	DC
State Saved	Saved with probe calibration data. Survives a power cycle and is not affected by a Preset or Restore
Range	DC AC 1.7 Hz LFR1 AC 0.14 Hz LFR2

Clear Calibration

Clears the calibration data for the current port and probe. It does not clear the data for other probe types or other ports. If the sensed probe has EEPROM identification, only the data for that specific probe is cleared. After this command has completed, the probe calibration state will be the same as if no probe calibration had ever been performed for the specified channel and probe. The probe attenuation will be the default value for that probe type and the Cable Calibration frequency response corrections will be used. This command is dependent on the Differential Input state. When Differential Input is on, both the data for the probe attached to the main port and the data for the probe attached to the complementary port are cleared. When Differential Input is off, only data for the probe attached to the main port is cleared.

Remote Command	<code>:CALibration:IQ:PROBe:Q:CLEar</code>
Example	<p>Clear the calibration data for the Q channel and the current probe (with EEPROM identification) or probe type (without EEPROM identification): <code>:CAL:IQ:PROBe:I:CLE</code></p>

6.2.21.6 Calibrate

Invokes the guided probe calibration. The guided probe calibration is context sensitive and depends on the channel (I or Q) and the Differential Input state. The calibration is only performed on the selected channel. When the Differential control is switched to Differential, both the probe attached to the main port and the probe attached to the complementary port are calibrated. When the Differential control is switched to Single Ended, only the probe attached to the main port is calibrated.

The I/Q Isolation Calibration must be run before calibrating any port with either the I/Q Cable Calibration or I/Q Probe Calibration. See "[I/Q Isolation Calibration](#)" on [page 3042](#)

Q Port

The Q port calibration is performed with the probe body attached to the front panel's Q port and the probe tip connected via an adapter to the Cal Out port. The guided calibration will show a diagram of the required connections.

Remote Command	<code>:CALibration:IQ:PROBe:Q</code>
Example	<code>:CAL:IQ:PROB:Q</code>
Notes	The Q port must be connected to the Cal Out port before issuing the command The calibration data is saved as soon as the port is calibrated and survives power cycles. It is not reset by any preset or restore data commands
State Saved	No

Q Port Probe Calibration Time (Remote Query Only)

Return the last date and time that the I/Q Probe Calibration was performed for a specific port.

Remote Command	<code>:CALibration:IQ:PROBE:Q:TIME?</code>
Example	<code>:CAL:IQ:PROB:Q:TIME?</code>
Notes	Returns 6 integer values: year, month, day, hour, minute, second. When no calibration has been performed, all values are 0. The value is specific to both the port and probe, so the value will change as probes are connected or disconnected
Annunciation	Guided Calibration, Probe Calibration, Last Calibration

Q-bar Port

The Q-bar port calibration is performed with the probe body attached to the front panel's Q-bar port and the probe tip connected via an adapter to the Cal Out port. The Q-bar probe calibration is only available for passive probes with Differential On. The guided calibration will show a diagram of the required connections.

Remote Command	<code>:CALibration:IQ:PROBE:QBar</code>
Example	<code>:CAL:IQ:PROB:QB</code>
Notes	The Q-bar port must be connected to the Cal Out port before issuing the command

	The calibration data is saved as soon as the port is calibrated and will survive power cycles. It is not reset by any preset or restore data commands
State Saved	No

Q-bar Probe Calibration Time (Remote Query Only)

Return the last date and time that the I/Q Probe Calibration was performed for a specific port.

Remote Command	<code>:CALibration:IQ:PROBe:QBAR:TIME?</code>
Example	<code>:CAL:IQ:PROB:QBAR:TIME?</code>
Notes	Returns 6 integer values: year, month, day, hour, minute, second. When no calibration has been performed, all values are 0. The value is specific to both the port and probe, so the value will change as probes are connected or disconnected
Annunciation	Guided Calibration, Probe Calibration, Last Calibration

6.2.22 I/Q Cable Calibrate

The I/Q cable calibration creates correction data for each of the front panel I/Q ports. This calibration data is used whenever no probe specific calibration data is available. It is important that all ports are calibrated using the same short BNC cable so that the data is comparable from port to port.

The guided calibration (front panel only) will show connection diagrams and guide you through the isolation calibration and calibrating each port. The calibration data for each port is stored separately, so as soon as a port is calibrated that data is saved and will be used. If you press "Exit" to exit the calibration process, the data for the ports already completed will still be used. It is recommended that a calibration be completed once started, or if exited, that it be properly done before the next use of the I/Q ports. The "Next" button will perform the calibration for the current port and then proceed to the next step in the calibration procedure. The "Back" button will return to the prior port in the procedure. Both keys and dialog buttons are supplied for ease of use. The dialog buttons are for mouse use and the softkeys for front panel use.

The calibration can also be done via SCPI, but no connection diagrams will be shown. You will have to make the correct connections before issuing each port calibration command. Again, it is recommended that all ports be calibrated at the same time.

The instrument state remains as it was prior to entering the calibration procedure except while a port is actually being calibrated. Once a port is calibrated it returns to the prior state. A port calibration is in process only from the time the "Next" button is

6 Input/Output
6.2 Input

pressed until the next screen is shown. For SCPI, this corresponds to the time from issuing the CAL:IQ:FLAT:I|IB|Q|QB command until the operation is complete.

For example, if the prior instrument state is Cal Out = Off, Input = I+jQ, and Differential = Off, then up until the time the "Next" button is pressed the I Input and Q Input LEDs are on and the Cal Out, I-bar Input and Q-bar Input LEDs are off. Once the "Next" button is pressed for the I port calibration, only the Cal Out and I Input LEDs will be on and the others will be off. When the screen progresses to the next step ("Next" button again enabled), the prior state is restored and only the I Input and Q Input LEDs are on (Cal Out is off again).

The last calibration date and time for each port will be displayed. Any calibrations that are more than a day older than the most recent calibration will be displayed with the color amber.

The I/Q Isolation Calibration must be run before calibrating any port with either the I/Q Cable Calibration or I/Q Probe Calibration. See "[I/Q Isolation Calibration](#)" on [page 3042](#)

Dependencies	Only appears when I/Q is the selected input
--------------	---

6.2.22.1 I Port

The I port calibration is performed with the front panel's I port connected via a short BNC cable to the Cal Out port. The guided calibration will show a diagram of the required connections.

Remote Command	<code>:CALibration:IQ:FLATness:I</code>
----------------	---

Example	<code>:CAL:IQ:FLAT:I</code>
---------	-----------------------------

Notes	<p>The recommended procedure is to use the same BNC cable to calibrate all I/Q ports. All I/Q ports should be calibrated sequentially during the procedure</p> <p>The calibration data is saved as soon as the port is calibrated and will survive power cycles. It is not reset by any preset or restore data commands</p> <p>The I port must be connected to the Cal Out port before issuing the command</p>
-------	--

State Saved	No
-------------	----

6.2.22.2 I-bar Port

The I-bar port calibration is performed with the front panel's I-bar port connected via a short BNC cable to the Cal Out port. The guided calibration will show a diagram of the required connections.

Remote Command	<code>:CALibration:IQ:FLATness:IBAR</code>
----------------	--

Example	<code>:CAL:IQ:FLAT:IBAR</code>
Notes	<p>The recommended procedure is to use the same BNC cable to calibrate all I/Q ports. All I/Q ports should be calibrated sequentially during the procedure</p> <p>The calibration data is saved as soon as the port is calibrated and will survive power cycles. It is not reset by any preset or restore data commands</p> <p>The I-bar port must be connected to the Cal Out port before issuing the command</p>
State Saved	No

6.2.22.3 Q Port

The Q port calibration is performed with the front panel's Q port connected via a short BNC cable to the Cal Out port. The guided calibration will show a diagram of the required connections.

Remote Command	<code>:CALibration:IQ:FLATness:Q</code>
Example	<code>:CAL:IQ:FLAT:Q</code>
Notes	<p>The recommended procedure is to use the same BNC cable to calibrate all I/Q ports. All I/Q ports should be calibrated sequentially during the procedure</p> <p>The calibration data is saved as soon as the port is calibrated and will survive power cycles. It is not reset by any preset or restore data commands</p> <p>The Q port must be connected to the Cal Out port before issuing the command</p>
State Saved	No

6.2.22.4 Q-bar Port

The Q-bar port calibration is performed with the front panel's Q-bar port connected via a short BNC cable to the Cal Out port. The guided calibration will show a diagram of the required connections.

Remote Command	<code>:CALibration:IQ:FLATness:QBAR</code>
Example	<code>:CAL:IQ:FLAT:QBAR</code>
Notes	<p>The recommended procedure is to use the same BNC cable to calibrate all I/Q ports. All I/Q ports should be calibrated sequentially during the procedure</p> <p>The calibration data is saved as soon as the port is calibrated and will survive power cycles. It is not reset by any preset or restore data commands</p> <p>The Q-bar port must be connected to the Cal Out port before issuing the command</p>
State Saved	No

6.2.22.5 I/Q Cable Calibration Time (Remote Query Only)

Returns the last date and time that the I/Q Cable Calibration was performed for a specific port.

Remote Command	<code>:CALibration:IQ:FLATness:I IBAR Q QBAR:TIME?</code>
Example	<code>:CAL:IQ:FLAT:I:TIME?</code>
Notes	Returns 6 integer values: year, month, day, hour, minute, second. When no calibration has been performed, all values are 0
Annunciation	Guided Calibration, Cable Calibration, Last Calibration

6.2.23 Audio Input Channel

Determines which Audio Input to be used for audio measurements.

Remote Command	<code>[:SENSe]:FEED:AFINput:PORT CH1 CH2</code> <code>[:SENSe]:FEED:AFINput:PORT?</code>
Example	<code>:FEED:AFIN CH1</code>
Dependencies	Only appears in Radio Test Mode Only appears in modular products, and only if an M9260A Audio Analyzer module is installed
Preset	Unaffected by Mode Preset, but set to Channel 1 by Input/Output Preset

6.2.24 Audio Calibrator

Lets you turn on the internal calibrator in the X-Series Audio board.

Remote Command	<code>[:SENSe]:FEED:AFALign OFF REF10</code> <code>[:SENSe]:FEED:AFALign?</code>
Example	<code>:FEED:AFAL REF10</code>
Dependencies	Only appears in Measuring Receiver Mode's Audio Measurements when Option 107 is present
Preset	<code>OFF</code>

6.2.25 Audio Coupling

Lets you set AC or DC coupling for the currently selected audio input.

Remote Command	<code>[:SENSe]:AFINput[1] 2:COUPling AC DC</code> <code>[:SENSe]:AFINput[1] 2:COUPling?</code>
----------------	---

Example	<code>:AFIN:COUP AC</code>
Dependencies	Only appears in Measuring Receiver Mode and Radio Test Mode In Measuring Receiver Mode, only appear in Audio Measurements, and only if Option 107 is present In Radio Test Mode, only appears in modular products, and only if an M9260A Audio Analyzer module is installed
Preset	<code>AC</code>

6.2.26 Audio Input Ground

Lets you float or ground the low side of the currently selected audio input channel. When you choose `FLOat`, the low side of the input is disconnected from ground.

Remote Command	<code>[:SENSe]:AFINput[1] 2:LOW FLOat GROund</code> <code>[:SENSe]:AFINput[1] 2:LOW?</code>
Example	<code>:AFIN2:LOW FLO</code>
Dependencies	Only appears in Radio Test Mode Only appears in modular products, and only if an M9260A Audio Analyzer module is installed
Preset	Unaffected by Mode Preset, but set to <code>GROund</code> by Input/Output Preset

6.2.27 Audio In Impedance

Lets you set the Impedance of the currently selected audio input channel. The value you enter is rounded up to the nearest allowed value.

Remote Command	<code>[:SENSe]:AFINput[1] 2:IMPedance 50 600 1000000</code> <code>[:SENSe]:AFINput[1] 2:IMPedance?</code>
Example	<code>:AFIN:IMP 50</code>
Dependencies	Only appears in Radio Test Mode Only appears in modular products, and only if an M9260A Audio Analyzer module is installed
Preset	Unaffected by Mode Preset, but set to 600 by Input/Output Preset

6.2.28 Input/Output Preset

Resets the group of settings and data associated with the **Input/Output** front-panel key to their default values. These settings are not affected by **Mode Preset** because they are generally associated with connections to the instrument, which you generally would not want to reset every time you press **Mode Preset**.

6 Input/Output

6.2 Input

This is the same as the control in the **Preset** dropdown, and also the same as **Input/Output** button in the **Restore Defaults** menu under **System**.

All the variables set under the **Input/Output** front panel key are reset by **Input/Output Preset**, including Amplitude Corrections and Data (described in the **Corrections** section), with the exception of RF Source settings, which are unaffected.

By using **Input/Output Preset** and **Restore Mode Defaults**, a full preset of the current mode will be performed, with the caveat that since **Input/Output Preset** is a global function it will affect *all* Modes.

When **Input/Output Preset** is selected, a message appears saying:

“This will reset all of the Input/Output variables to their default state, including which input is selected, all Amplitude Correction settings and data, all External Mixing settings, all Frequency Reference settings and all Output settings.

It will not affect Alignment data or settings.

It will not affect RF Source settings.

This action cannot be undone. Do you want to proceed?”

Use the **OK** or **Cancel** buttons to affirm or cancel the operation.

Example

```
:SYST:DEF INP
```

presets all Input/Output variables to their factory default values

6.3 External Gain

Contains controls that allow you to compensate for gain or loss in the measurement system outside the instrument. The External Gain is subtracted from the amplitude readout (or the loss is added to the amplitude readout). So, the displayed signal level represents the signal level at the output of the device-under-test, which can be the input of an external device that provides gain or loss.

Entering an External Gain value does not affect the Reference Level, therefore the trace position on screen changes, as do all of the values represented by the trace data. Thus, the values of exported trace data, queried trace data, marker amplitudes, trace data used in calculations such as N dB points, trace math, peak threshold, etc., are all affected by External Gain. Changing the External Gain, even on a trace that is not updating, immediately changes all of the above, without new data needing to be taken.

NOTE

Changing the External Gain causes the instrument to immediately stop the current sweep and prepare to begin a new sweep. The data will not change until the trace data updates because the offset is applied to the data as it is taken. If a trace is exported with a nonzero External Gain, the exported data will contain the trace data with the offset applied.

In Spectrum Analyzer Mode, a Preamp is the common external device providing gain or loss. In a measurement application mode like GSM or W-CDMA, the gain or loss could be from a BTS (Base Transceiver Station) or an MS (Mobile Station). So, in the Spectrum Analyzer mode MS and BTS would be grayed out and the only choice would be Ext Preamp. Similarly, in some of the digital communications applications, Ext Preamp will be grayed out and you would have a choice of MS or BTS.

The Ext Preamp, MS, and BS controls may be grayed-out depending on which measurement is currently selected. If any of the grayed-out controls are pressed, or the equivalent SCPI command is sent, an advisory message is generated.

6.3.1 External Preamp

This function is similar to the reference level offset function. Both affect the displayed signal level. Ref Lvl Offset is a mathematical offset only, no instrument configuration is affected. Ext Preamp gain is used when determining the auto-coupled value of the Attenuator. The External Gain value and the Maximum Mixer Level settings are both part of the automatic setting equation for the RF attenuation setting. (10 dB of Attenuation is added for every 10 dB of External Gain.)

6 Input/Output
6.3 External Gain

Note that the Ref Lvl Offset and Maximum Mixer Level are described in the Amplitude section. They are reset by Mode Preset. The External Preamp Gain is reset by the "Restore Input/Output Defaults" or "Restore System Defaults->All" functions.

The Swept SA Measurement in SA Mode only supports the "Ext Preamp" function under External Gain. The other External Gain functions are grayed-out, and generate a settings conflict, if the SCPI for them is sent.

See ["More Information" on page 3058](#)

Remote Command	<code>[:SENSe] :CORRection:SA[:RF]:GAIN <rel_amp1></code> <code>[:SENSe] :CORRection:SA[:RF]:GAIN?</code>
Example	Set the Ext Gain value to 10 dB: <code>:CORR:SA:GAIN 10</code> Set the Ext Gain value to -10 dB (that is, an attenuation of 10 dB): <code>:CORR:SA:GAIN -10</code>
Notes	Does not auto return This command is new in X-Series
Dependencies	The reference level limits are determined in part by the External Gain/Atten, Max Mixer Level, and RF Atten Grayed-out in Modes that do not support External Gain
Preset	Unaffected by Preset, but set to 0 dB by Restore Input/Output Defaults or Restore System Defaults->All 0.00 dB, Gain
State Saved	Saved in instrument state
Min	-120 dB
Max	120 dB
Annotation	Displayed in the Meas Bar as "Ext Gain <value>". When the gain is zero, no annotation is shown
Backwards Compatibility SCPI	<code>[:SENSe] :CORRection:OFFSet[:MAGNitude]</code> The legacy Ext Preamp Gain key is now called Ext Gain and the sub-menu has choices of Ext Preamp MS BTS for backwards compatibility

More Information

The U7227A USB Preamplifier is an accessory for the X-Series Signal Analyzer that provides gain externally, and whose gain settings are automatically loaded into the instrument over USB whenever it is connected to one of the instrument's USB ports.

While the USB Preamplifier is plugged into one of the instrument's USB ports, the instrument will consider it to be in the signal path of the RF Input and will apply the calibration data from the USB Preamp to measurements taken at the RF Input (on 2

input boxes, it will be considered to be in the signal path of RF Input 1; it is not supported for RF Input 2).

The USB Preamplifier contains its own cal data. This includes a noise trace suitable for use with NFE, for those models which support NFE. The act of connecting the Preamp to USB will cause the cal data to be downloaded from the preamp. When this happens, an informational message is provided saying “Cal data loaded from USB Preamp”. The instrument will then automatically apply the calibration factors loaded from the Preamp in any measurement that supports the USB Preamp.

The External Preamp Gain setting may still be used, even though it is not required for the USB Preamp (since the USB Preamp supplies its own gain data to the instrument which is applied automatically). Connecting the USB Preamp does not change the External Preamp Gain setting, however unless you have another gain or attenuation element in the signal path, the appropriate setting for External Preamp Gain is 0 dB.

Overload detection and reporting will apply when the USB preamplifier is connected to USB. The USB Preamplifier has its own overload detector which reports overloads to the instrument over USB. This generates an error condition, “Input Overload; USB Preamp.”

If, while the USB Preamp is connected to USB, a measurement is selected that does not support the USB preamplifier, the "No result; Meas invalid with Preamp" error condition is generated.

6.3.2 External Gain - MS

Sets an external gain/attenuation value for MS (Mobile Station) tests.

Remote Command	<code>[:SENSe]:CORRection:MS[:RF]:GAIN <rel_amp1></code> <code>[:SENSe]:CORRection:MS[:RF]:GAIN?</code>
Example	Set the Ext Gain value to 10 dB: <code>:CORR:MS:GAIN 10</code> Set the Ext Gain value to -10 dB (that is, a loss of 10 dB): <code>:CORR:MS:GAIN -10</code>
Notes	Does not auto return
Dependencies	The reference level limits are determined in part by the External Gain, Max Mixer Level, RF Atten Grayed-out in modes that do not support MS
Preset	Unaffected by Preset, but set to 0 dB by Restore Input/Output Defaults or Restore System Defaults->All 0.00 dB, Gain
State Saved	Saved in instrument state
Min	-100 dB
Max	100 dB

6 Input/Output

6.3 External Gain

Example	<p>Set the Ext Gain value to -10 dB, and subsequently querying :LOSS will give 10 dB: :CORR:MS:LOSS 10</p> <p>Set the Ext Gain value to 10 dB. Subsequently querying :LOSS will return -10 dB: :CORR:MS:LOSS -10</p>
Notes	<p>A positive value of <rel_amp1> in the above command means a loss and a negative value indicates a gain</p> <p>If :LOSS is set, :GAIN is set to the negative value of the parameter sent</p> <p>If :LOSS is queried, it returns the negative of :GAIN</p>
Preset	Unaffected by Preset, but set to 0 dB by Restore Input/Output Defaults or Restore System Defaults->All
Min	100 dB
Max	-100 dB
Backwards Compatibility SCPI	<p>[:SENSe]:CORRection:MS[:RF]:LOSS <rel_amp1></p> <p>[:SENSe]:CORRection:MS[:RF]:LOSS?</p>

6.3.3 External Gain - BTS

Sets an external attenuation value for BTS (Base Transceiver Station) tests.

Remote Command	<p>[:SENSe]:CORRection:BTS[:RF]:GAIN <rel_amp1></p> <p>[:SENSe]:CORRection:BTS[:RF]:GAIN?</p>
Example	<p>Set the Ext Gain value to 10 dB: :CORR:BTS:GAIN 10</p> <p>Set the Ext Gain value to -10 dB (that is, a loss of 10 dB): :CORR:BTS:GAIN -10</p>
Notes	Does not auto return
Dependencies	The reference level limits are determined in part by the External Gain, Max Mixer Level, RF Atten Grayed-out in modes that do not support BTS
Preset	Unaffected by Preset, but set to 0 dB by Restore Input/Output Defaults or Restore System Defaults->All 0.00 dB, Gain
State Saved	Saved in instrument state
Min	-100 dB
Max	100 dB
Example	<p>Set the Ext Gain value to -10 dB, and subsequently querying :LOSS will give 10 dB: :CORR:BTS:LOSS 10</p> <p>Set the Ext Gain value to 10 dB. Subsequently querying :LOSS will return -10 dB:</p>

	<code>:CORR:BTS:LOSS -10</code>
Notes	A positive value of <code><rel_amp1></code> in the above command means a loss and a negative value indicates a gain If <code>:LOSS</code> is set, <code>:GAIN</code> is set to the negative value of the parameter sent If <code>:LOSS</code> is queried, it returns the negative of <code>:GAIN</code>
Preset	Unaffected by Preset, but set to 0 dB by Restore Input/Output Defaults or Restore System Defaults->All
Min	100 dB
Max	-100 dB
Backwards Compatibility SCPI	<code>[:SENSe]:CORRection:BTS[:RF]:LOSS <rel_amp1></code> <code>[:SENSe]:CORRection:BTS[:RF]:LOSS?</code>

6.3.4 I Ext Gain

Affects the I channel input. However, when Q Gain in I+jQ is set to Same as I Gain, this value is applied to both I and Q channel inputs.

Remote Command	<code>[:SENSe]:CORRection:IQ:I:GAIN <rel_amp1></code> <code>[:SENSe]:CORRection:IQ:I:GAIN?</code>
Example	Set the I Ext Gain to 10 dB: <code>:CORR:IQ:I:GAIN 10</code> Set the I Ext Gain to -10 dB (that is, a loss of 10 dB): <code>:CORR:IQ:I:GAIN -10</code>
Dependencies	Not available unless option BBA is installed Grayed-out when I/Q Path is Q Only
Preset	0 dB Unaffected by Preset, but set to 0 dB by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Yes
Min	-100 dB
Max	100 dB
Annotation	Ext Gain: <I Ext Gain> dB No annotation is shown when Input is not I/Q. Also not shown when I Ext Gain is 0.00 dB. I Ext Gain is not shown for Input Path Q Only. When the Input Path is Independent I and Q and I Ext Gain is not the same as Q Ext Gain, both are shown. "Ext Gain: <I Ext Gain> dB, <Q Ext Gain> dB"

6.3.5 Q Ext Gain

Affects the Q channel input.

6 Input/Output

6.3 External Gain

Remote Command	<code>[:SENSe]:CORRection:IQ:Q:GAIN <rel_amp></code> <code>[:SENSe]:CORRection:IQ:Q:GAIN?</code>
Example	Set the Q Ext Gain to 10 dB: <code>:CORR:IQ:Q:GAIN 10</code> Set the Q Ext Gain to -10 dB (that is, a loss of 10 dB): <code>:CORR:IQ:Q:GAIN -10</code>
Dependencies	Not available unless option BBA is installed Grayed-out when Q gain in I+jQ is set to Same as I Gain
Preset	0 dB Unaffected by Preset, but set to 0 dB by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state
Min	-100 dB
Max	100 dB
Annotation	Ext Gain: <Q Ext Gain> dB No annotation is shown when Input is not I/Q. Also not shown when Q Ext Gain is 0.00 dB. Q Ext Gain is not shown for Input Path I Only or I+jQ. When Input Path is Independent I and Q and when I and Q Ext Gain are both non-zero but are the same the annotation will be "Ext Gain: <Ext Gain> dB" and when I Ext Gain is not the same as Q Ext Gain, both are shown. "Ext Gain: <I Ext Gain> dB, <Q Ext Gain> dB"

6.3.6 Q Gain in I+jQ

When Same as I Gain (**ON**) is selected, I Ext Gain value is applied to both I and Q channel input if the Input Path is I+jQ.

When Independent (**OFF**) is selected, I and Q Ext Gain values are applied to I and Q channel input independently.

Remote Command	<code>[:SENSe]:CORRection:IQ:Q:GAIN:COUPle ON OFF 0 1</code> <code>[:SENSe]:CORRection:IQ:Q:GAIN:COUPle?</code>
Example	<code>:CORR:IQ:Q:GAIN:COUP ON</code> <code>:CORR:IQ:Q:GAIN:COUP?</code>
Preset	ON
State Saved	Yes
Range	Same as I Gain Independent

6.4 Data Source

Contains controls that let you select the source of the data being fed to the instrument analysis engine.

The ability to Save and Record files of I/Q data is an important feature of some X-Series applications, and the Data Source controls allow you to switch back and forth from actual data at the instrument input and recorded data from a File.

In addition, some measurements allow you to retain a single measurement record in a Capture Buffer, and some measurements allow you to retain a specified length data record internally in a Recorded data area.

So, for measurements that support it, the controls on this tab allow you to select data from the instrument inputs, a recalled recording File, the Capture Buffer, or the Recorded data area. For measurements that do not support these features, the **Data Source** tab does not appear, and if `:FEED:DATA SCPI` is sent, an Undefined Header error is generated.

The available choices depend on which measurement you are running. All measurements support Input; Capture Buffer and File are only available in certain measurements, as shown in the table below. The choice of the internal Recorded data area is only available in Pulse Mode.

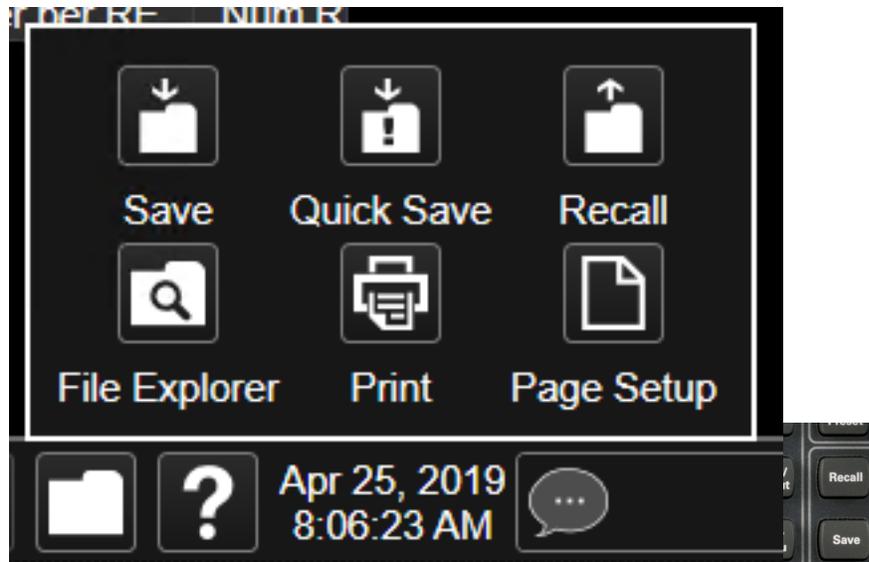

Measurement	Capture Buffer	File
WCDMA Code Domain	x	
WCDMA Mod Accuracy	x	
VMA Digital Demod		x
VMA Custom OFDM		x
5G NR Modulation Analysis		x
FDD LTE-A Modulation Analysis		x
TDD LTE-A Modulation Analysis		x
WLAN Modulation Analysis	x	x
WLAN Spectral Flatness		x
WLAN MIMO Modulation Analysis		x
Analog Demod AM		x
Analog Demod PM		x
Analog Demod FM		x
Analog Demod FM Stereo		x
Bluetooth Transmit Analysis	x	x
IoT & SRComms LoRa CSS Demod		x

How to Record and Playback I/Q Data

In several Demod measurements (and certain other measurements), it is possible to record I/Q data to files on your hard drive or network, and then recall these files for subsequent playback. These are the measurements shown in the table above with an “x” in the **File** column.

The Recording and Playback of signal data files is a multi-step process which involves controls in several menus (listed below).

Menus involved in Record/Playback:

- **Save, Recording** (under the **Save** hardkey or the **Save** icon in the **File** panel)
- **Recall, Recording** (under the **Recall** hardkey or the **Recall** icon in the **File** panel)
- **Sweep, Recording** tab
- **Sweep, Playback** tab
- **Input/Output, Data Source** tab (this tab)

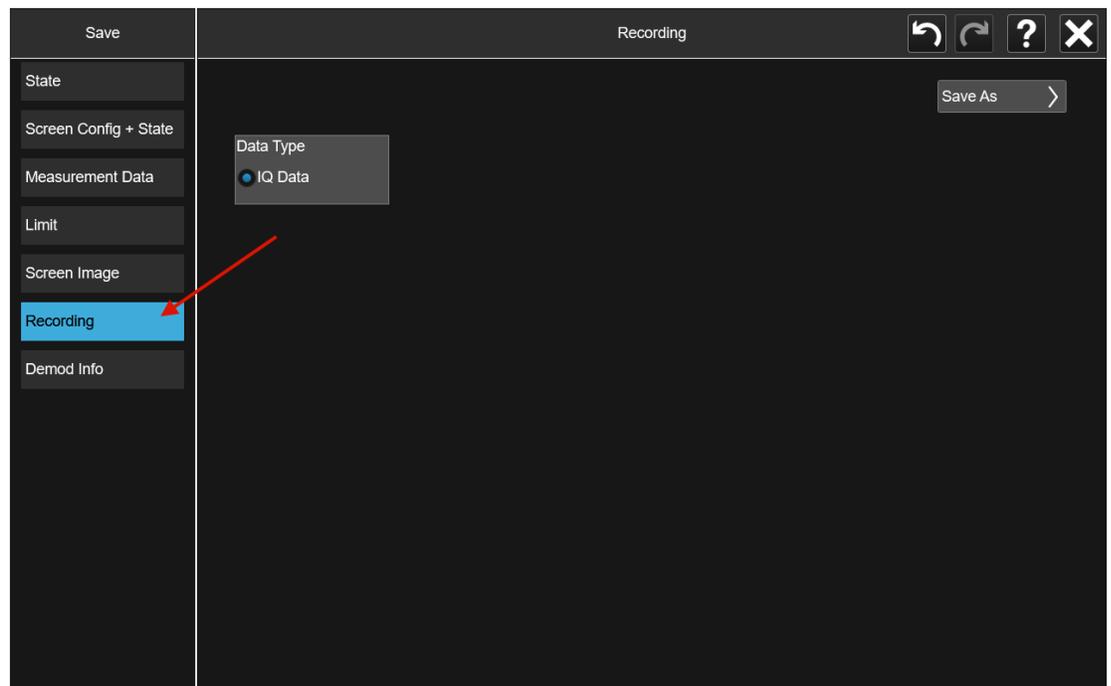

Saving a Recording

When you save a recording, a certain number of measurement records are saved to a Recording file. The amount of data that is saved varies depending on the measurement and measurement settings. The following example uses VMA Digital Demod to illustrate the process.

If you press the **Recording** tab in the **Sweep** menu, you will see a certain number of parameters displayed on the menu panel. Before you save a Recording, these parameters are all 0, as shown below:

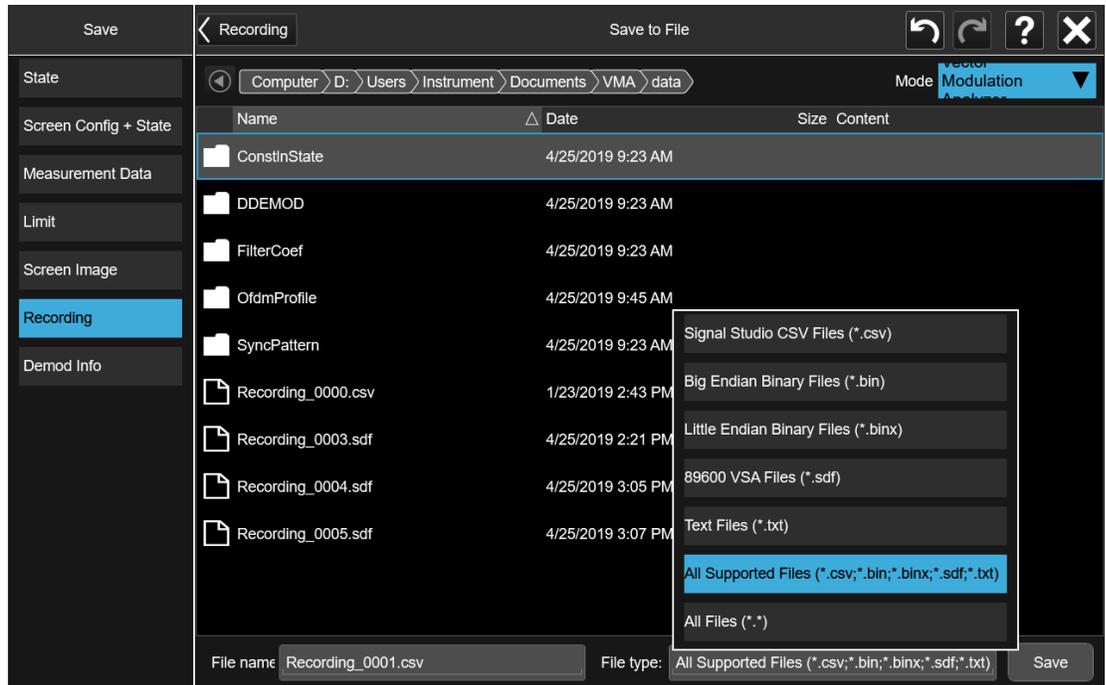

To save the data for the current measurement, press the **Save** hardkey (or the **Save** icon in the **File** panel) and press the **Recording** tab on the left side of the **Save** panel:

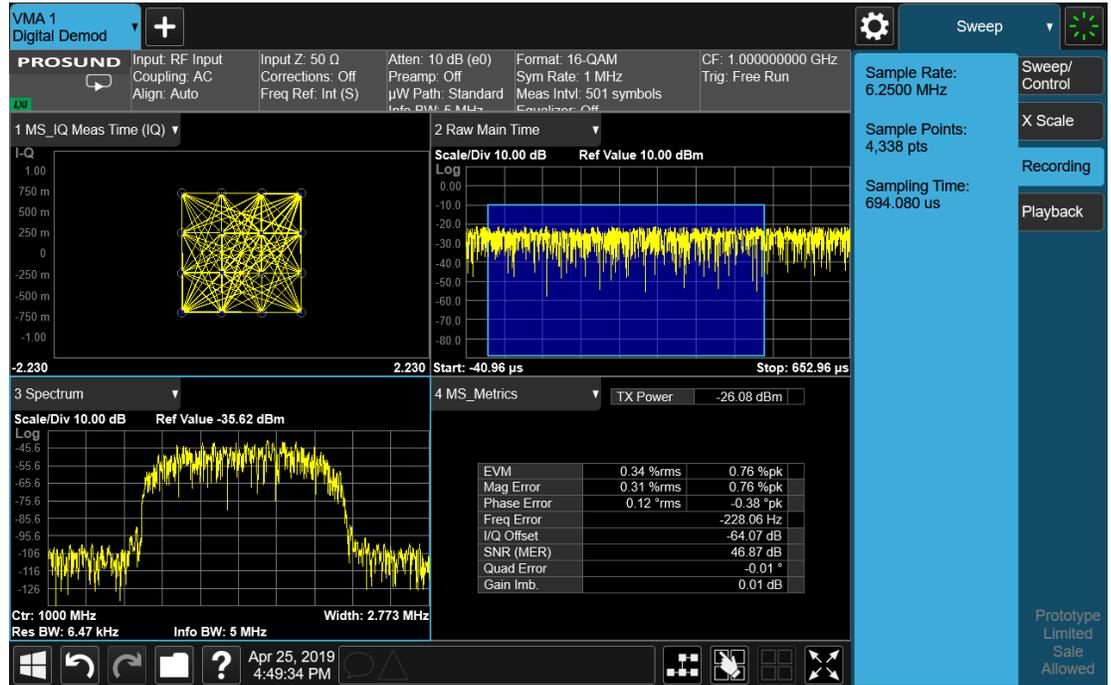

6 Input/Output
6.4 Data Source

Then press **Save As** and choose the file type you would like to use for the Save (**CSV**, **SDF**, **TXT**, **BIN**, **BINX**). You can find details of the file formats in **Save > Recording**.

Then press **Save** to save the raw I/Q data of the current measurement.

After the Save, you will see that the data on the Recording panel has changed to describe the data in the file you just saved. You should note this data in case you need to refer to it when you recall the file, particularly as not all file formats include the Sample Rate that was used to save the data. In particular, **BIN** and **BINX** files do not include sampling rate information inside the file, so after recalling one of these file types, you will need to set the Sample Rate manually in the **Sweep, Playback** menu.

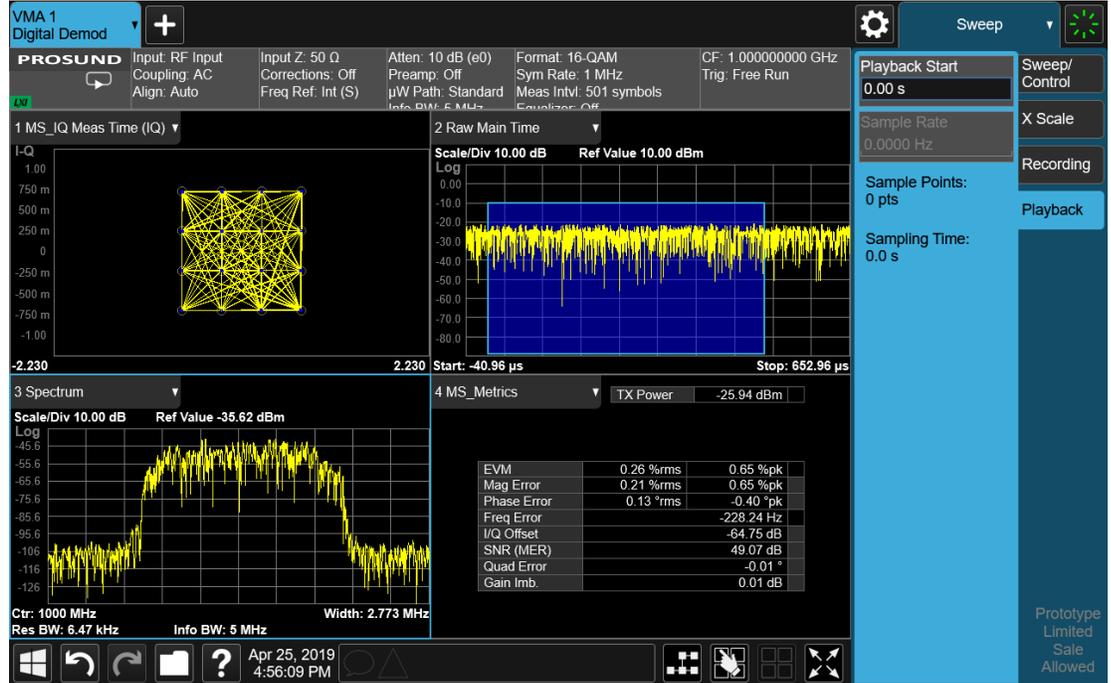

Step 2: Recalling a Recording

If you press the **Playback** tab in the **Sweep** menu, you will see a certain number of parameters displayed on the menu panel. Before you recall a Recording, these parameters are all 0, as shown below:

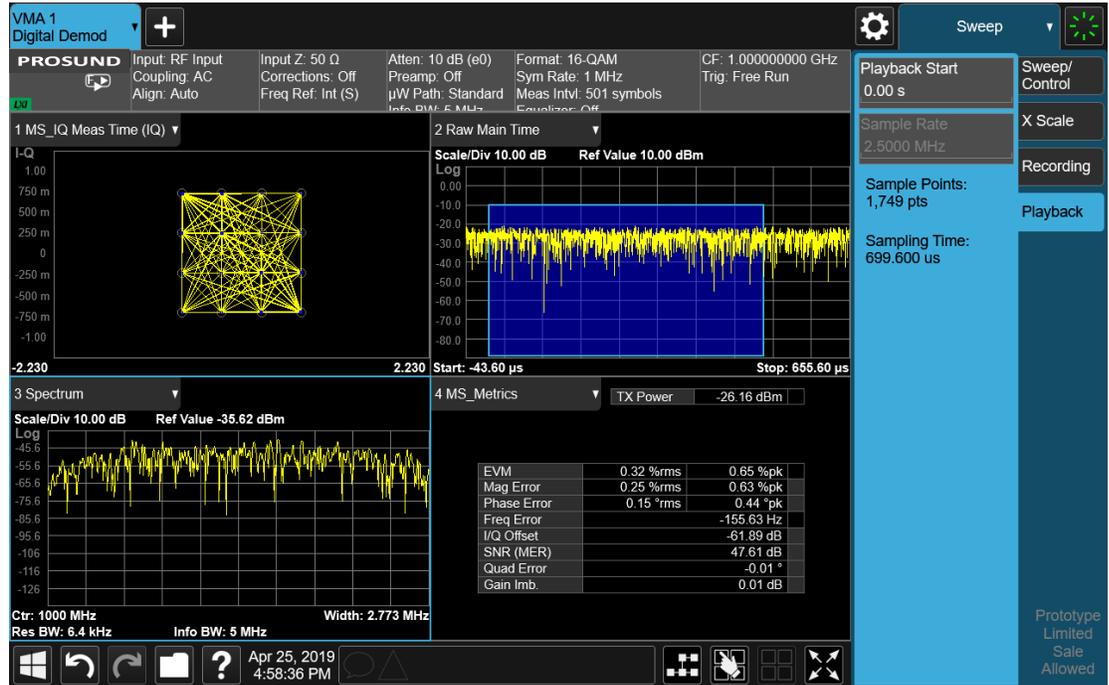

6 Input/Output

6.4 Data Source

To recall a Recording, press the **Recall** hardkey (or the **Recall** icon in the **File** panel) and press the **Recording** tab on the left side of the **Recall** panel. Then press **Recall From** and choose the file you would like to recall. This will read the raw I/Q data from the specified file and feed it to the current measurement.

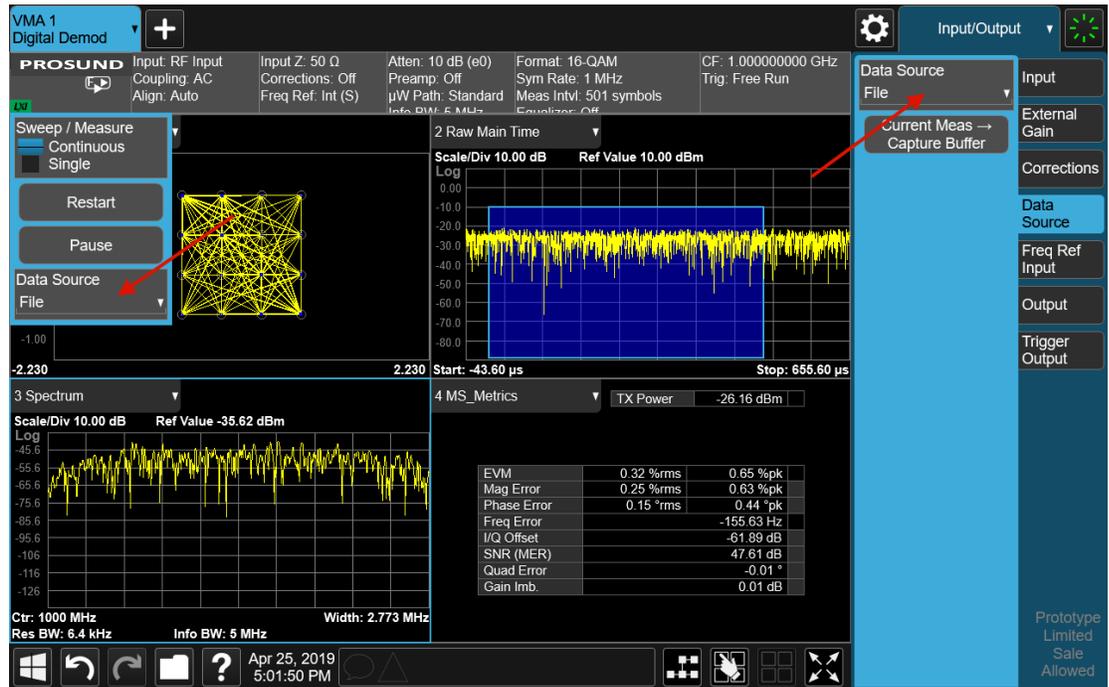

After the Recall, you will see that the data on the Recording panel has changed to describe the data in the file you just recalled:

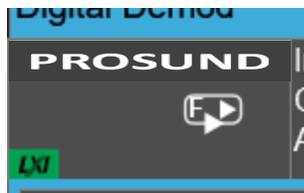

Note that the **Sample Rate** key is grayed out if the file type you loaded contains Sample Rate information. **BIN** and **BINX** files do not include sampling rate information inside the file, so after recalling one of these file types, you will need to set the Sample Rate. You should have noted the Sample Rate that was displayed on the **Sweep, Recording** menu panel after you saved the file.

After the recall is performed, you will also see that the **Data Source** control has switched to **File**. You can see this on the **Data Source** menu panel, and also on the dropdown from the Measurement Bar on the far-left side of the instrument:

6 Input/Output
6.4 Data Source

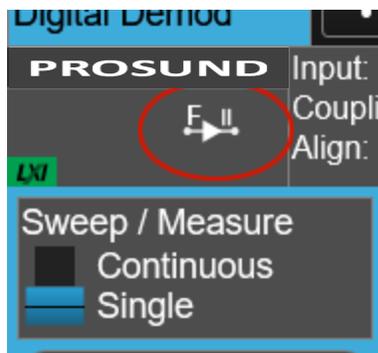

You can also see that the control indicator on the measurement bar has an “F” in it and the playback symbol (right facing triangle) displayed:

This indicates that the instrument is in **Continuous Playback** mode and is using data from a File.

If you select **Single** in the control dropdown, the indicator will change to show that it is in **Single Pause** mode as below:

You can now examine data in the recorded file which you loaded. How you do this depends on whether you are in **Continuous Playback** mode or **Single Pause** mode.

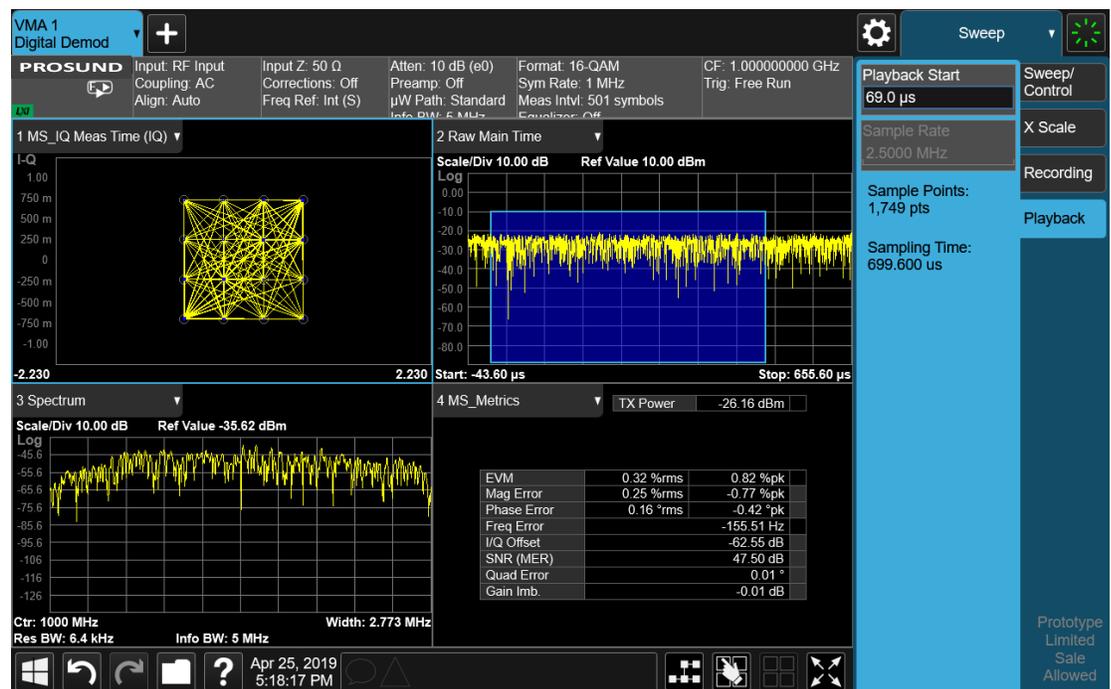

If you wish to return to looking at data at the instrument input, simply change the **Data Source** control from **File** back to **Input**.

Looking at your Recorded data

To examine the data you loaded, go to the **Playback** menu panel under **Sweep**. How you proceed from here depends on whether you are in **Continuous Playback** mode or **Single Pause** mode.

Continuous Playback mode

In this mode, turn the knob clockwise or use the **Up** key on the front panel to move through successive records in the recording. You will see the Playback Start control change from 0 to successively higher values as you move through the records.

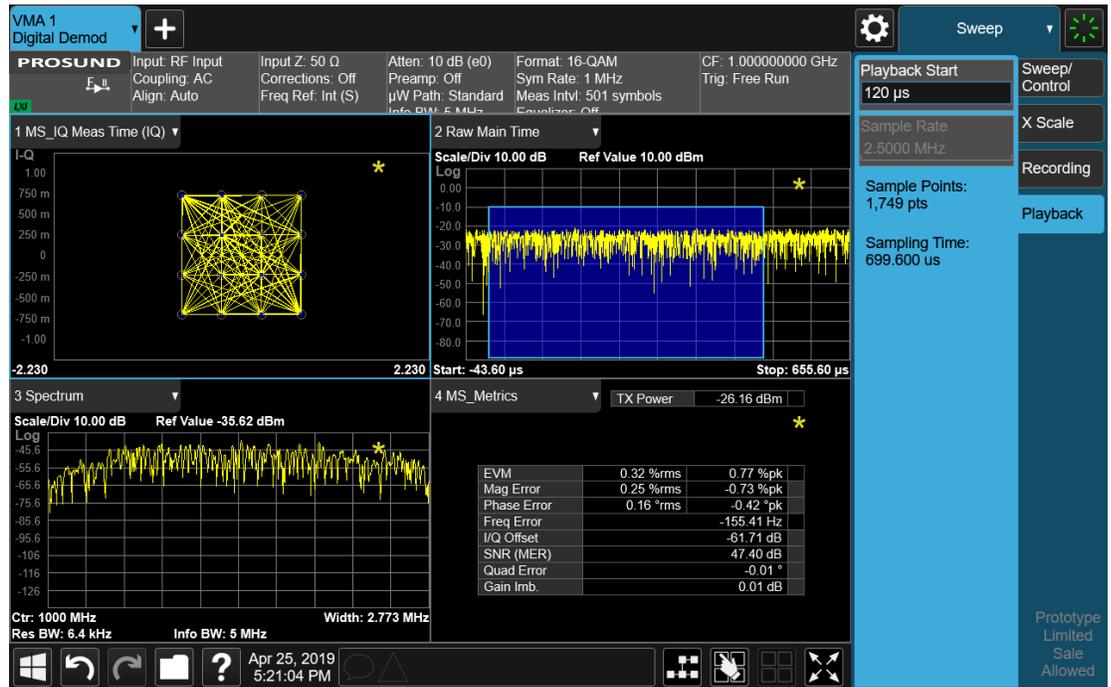

Single Pause mode

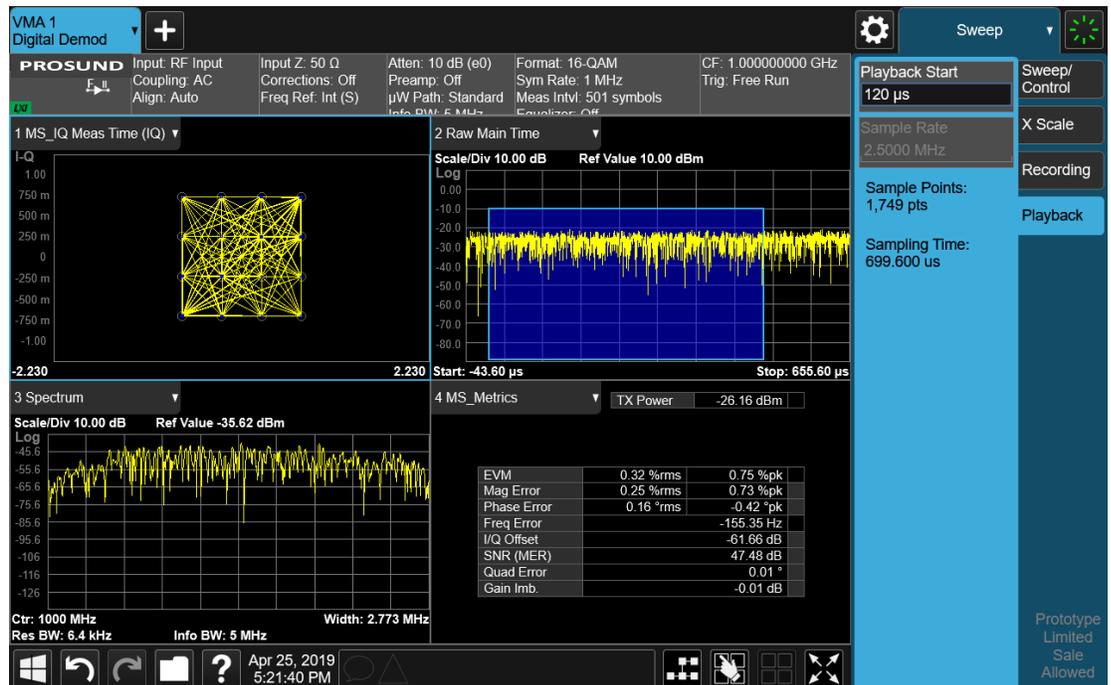

In this mode, you can only look at one record. Set the Playback Start time to the desired offset from zero and press **Restart**. A single record will be displayed.

Note that until you press **Restart**, the “invalid data” indicator (yellow asterisk) will be displayed in each window as below:

6 Input/Output
6.4 Data Source

Once you press **Restart**, the invalid data indicator will disappear, as below:

6.4.1 Data Source

Allows you to select the input to the analysis engine. The following options are available:

Input	INPut	A hardware input signal (the default). This causes the measurement to take its input data from the hardware input (for example RF, I/Q, or EXTMixer) currently selected on the Input tab under Input/Output
Capture Buffer	STORed	Data stored in a storage buffer from a single earlier acquisition. Selecting "Capture Buffer" allows you to use data that has been previously stored using the "Current Meas -> Capture Buffer" control. You can make a measurement and then, if you want to make a different measurement using the exact same data, store the raw data using the "Current Meas -> Capture Buffer" control and select "Capture Buffer" as the Data Source, then switch to the other measurement. You must have previously done a "Current Meas -> Capture Buffer" before the Capture Buffer choice is available for use
Recorded	RECORded	Data recorded to memory from a set of earlier acquisitions. Selecting "Recorded" lets you use the record buffer, previously filled by using the "Recording" tab in the Sweep menu, as the input (only available in the Pulse measurement)
File	FILE	Data recorded on a storage device from a set of earlier acquisitions. If you load a Recording using Recording under the Recall key, "File" is automatically selected, which lets you use the recorded data as though it were coming from the Input

See "[Data Source](#)" on page 3063 for a table of available choices on a per-measurement basis.

Remote Command	<code>[:SENSe]:FEED:DATA INPut STORed RECORded FILE</code> <code>[:SENSe]:FEED:DATA?</code>
Example	<code>:FEED:DATA INP</code> causes the measurement to look at the input selection <code>:FEED:DATA STOR</code> causes stored measurement data to be used with a different measurement that supports this <code>:FEED:DATA?</code>
Dependencies	If you switch to a measurement that does not support the currently selected Data Source, the instrument switches Data Source to "Input". Attempting to select an unavailable Data Source via SCPI generates an error The Data Source setting is independent for each mode. Not all Data Sources are available in all modes
Preset	Unaffected by Preset, but set to INPut by Restore Input/Output Defaults or Restore System

Defaults->All	
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>[:SENSe] : FEED : SOURce INPut STORed</code> <code>[:SENSe] : FEED : SOURce?</code>

6.4.2 Current Meas -> Capture Buffer

Stores the raw data of one measurement in the internal memory of the instrument where it can then be used by a different measurement by pressing **Stored Data**. When raw data is stored, then the data source selection switch automatically changes to **Stored Data**. Stored raw data cannot be directly accessed. There is no save/recall function to save the raw data in an external media. If you want to get the stored raw data, you must first perform a measurement using the stored raw data. Now you can access the used raw data, which is the same as stored raw data, using the `:FETch` or `:READ` commands.

Remote Command	<code>[:SENSe] : FEED : DATA : STORe</code>
Example	<code>: FEED : DATA : STOR</code> stores recorded data
Notes	Command only; no query
Dependencies	Grayed-out in the SA measurement
Backwards Compatibility SCPI	<code>[:SENSe] : FEED : SOURce : STORe</code>

6.5 Corrections

Accesses the **Corrections** menu, which lets you select, turn on and off, and configure and edit Corrections. You can also select, turn on and off and configure Complex Corrections and Corrections Groups.

Corrections arrays provide Amplitude Corrections, and can be entered by the user, sent over SCPI, or loaded from a file. They allow you to correct the response of the instrument for various use cases. X-Series supports eight separate Corrections arrays, each of which can contain up to 2000 points. They can be turned on and off individually and any or all can be on at the same time. Corrections Groups let you load several (Amplitude) Corrections at a time into a Correction Group.

Complex Correction arrays provide both Amplitude and Phase Corrections, and can be loaded from a file. Currently the file type supported has the extension .s2p. Complex Corrections operate in much the same manner as Corrections - the X-series supports eight separate Complex Corrections arrays, each of which can contain up to 30000 points, and each Complex Correction can be turned on and off individually and any or all can be on at the same time. Some Modes, such as Spectrum Analyzer Mode, only support only the Amplitude (Magnitude) element of Complex Corrections. Other Modes, such as IQ Analyzer Mode and VMA, support both the Amplitude and Phase elements of Complex Corrections. If a Complex Correction is turned on in a Measurement that does not support Phase, only the Magnitude information will be used for the Correction.

Trace data is in absolute units and corrections data is in relative units. You can edit the Corrections arrays in the Corrections editor using the “Edit Correction” dialog (you cannot edit the Complex Corrections arrays; they can only be loaded from a file).

In zero span measurements (such as Zero Span in the Swept SA measurement), where the frequency is always the center frequency of the instrument, we apply the (interpolated) correction for the center frequency to all points in the trace. In the event where there are two correction amplitudes at the center frequency, we apply the first one in the table.

Note that the corrections are applied as the data is taken; therefore, a trace in **View** (Update Off) will not be affected by changes made to the corrections after the trace is put in **View**.

The **Corrections** tab only appears in Modes and Measurements that support Corrections and/or Complex Corrections. In other Modes, sending SCPI for Corrections and/or Complex Corrections will generate a Settings Conflict message

Corrections and Complex Corrections arrays are not affected by a Preset, because they are in the Input/Output system. They also survive shutdown and restarting of the instrument application, which means they will survive a power cycle.

Corrections and Complex Corrections arrays are reset (deleted) by Restore Input/Output Defaults. The following commands delete the correction registers:

- User Preset the current mode :**SYST:PRES:USER**
- User Preset all modes :**SYST:PRES:USER ALL**
- Full mode preset :**SYST:PRES:FULL**
- Restore power on default :**SYST:DEF PON**
- Restore all defaults :**SYST:DEF; :SYST:DEF ALL**
- Preset Input/Output variables :**SYST:DEF INP**
- Delete all corrections :**CORR:CSET:ALL:DEL**

The instrument Save State and Save Screen Config + State includes the data in the correction registers. If a measurement setup is saved and then recalled at a later time, the correction data will be recalled as well. This feature is useful for recreating the full instrument condition, but the user has to be careful that the recalled correction data is the desired data. For example, if the state is recalled on a different instrument different correction data might be needed. Or if the system is recalibrated, the correction data in the save state would then be stale. Applications that use measured data for corrections will generally need to reload the correction data from file whenever a state is recalled; this ensures that the correction data is current and applies to hardware in use.

In the EXM and EXF, on the RF Input/Output panel, there are two full-duplex RF ports (RFIO1 and RFIO2), RF Input and RF Output. When RF Input is selected, it will correspond to one input port from two half-duplex RF ports (RFIO3 and RFIO4), and when RF Output is selected, it will correspond to one output port from two half-duplex RF ports (RFIO3 and RFIO4). So, there are 8 sets of corrections in all that can be applied to the RF ports. Ports cannot share the same set of corrections, but a single port can have multiple corrections applied to it. The correction data is applied to incoming signals as well as transmitted signals and is in the form of a list of spot frequencies and amplitude correction levels.

Annotation	In EMI Mode, you can choose to display the correction details in the graph area by turning on Display, Annotation, Correction Annotation
------------	--

6.5.1 Select Correction

Specifies the selected correction. The term "selected correction" is used throughout this document to specify which correction will be affected by the functions.

Notes	The selected correction is remembered even when not in the correction menu
Preset	Set to Correction 1 by Restore Input/Output Defaults

6.5.2 Correction On/Off

Turning the Selected Correction from **OFF** to **ON** allows the values in it to be applied to the data. This state transition also automatically turns on "Apply Corrections" (sets it to **ON**), otherwise the correction would not take effect.

A new sweep is initiated if an amplitude correction is switched on or off. Note that changing, sending or loading corrections data does *not* directly initiate a sweep, however in general these operations will turn corrections on, which *does* initiate a sweep.

Remote Command	<code>[:SENSe]:CORRection:CSET[1] 2 ... 16[:STATe] ON OFF 1 0</code> <code>[:SENSe]:CORRection:CSET[1] 2 ... 16[:STATe]?</code>
Example	<code>:SENS:CORR:CSET1 ON</code>
Dependencies	Changing this from OFF to ON automatically turns on "Apply Corrections" Note that if any Correction is turned on that has a transducer unit set (other than "None"), the Y-Axis Unit of the instrument is forced to that Transducer Unit. All other Y-Axis Unit choices are grayed-out This command generates an "Option not available" error unless you have the proper option installed in your instrument
Preset	Not affected by Preset. Set to OFF by Restore Input/Output Defaults
State Saved	Saved in instrument state
Annotation	If <i>any</i> Correction is turned on, Corr in the Meas Bar displays in amber to indicate Corrections are in use
Backwards Compatibility Notes	Unlike legacy instruments, Preset does not turn Corrections off (Restore Input/Output Defaults does)

6.5.3 Correction Port

Maps one of the sets of corrections to a particular I/O port. This control allows any Input port (including External Mixing, BBIQ, the RF2 input, etc.) to be mapped to a specific Correction, so that the Correction is only applied when that Port is being used by the current Screen. You can also map any internal source Output port to a specific Correction.

When Current Input (CINPut) is selected for **Correction Port**, it chooses the current input port of the current Screen for the selected Correction. In other words, the Correction applies to whichever input is selected. If the input changes, the correction applies to the new input.

When using the VXT SP900B/11A with Remote Radio Heads (such as the Keysight M1740A mmWave Transceiver for 5G), the choices in the dropdown menu appear as :

6 Input/Output
6.5 Corrections

Head h RFHD p

For example, if you have two Radio Heads (numbered 1 and 2), each of which have two RF half duplex ports, the choices for these ports appear as below:

Head and Port	Choice in dropdown	SCPI parameter
Head 1, port RF Tx/Rx 1	Head 1 RFHD 1	RRH1RFHD1
Head 1, port RF Tx/Rx 2	Head 1 RFHD 2	RRH1RFHD2
Head 2, port RF Tx/Rx 1	Head 2 RFHD 1	RRH2RFHD1
Head 2, port RF Tx/Rx 2	Head 2 RFHD 2	RRH2RFHD2

Remote Command `[:SENSe]:CORRection:CSET[1]|2|...|16:RF:PORT CINPut | RFIN | RFIN2 | AIQ | EMIXer | RFIO1 | RFIO2 | RFIO3 | RFIO4 | RFOut | RFHD | RFFD | ANT | GEN | TR | A1 | A2 | A3 | B1 | B2 | B3 | IFIO1 | IFIO2 | RRHnRFHDp | ERFIN`

`[:SENSe]:CORRection:CSET[1]|2|...|16:RF:PORT?`

Example `:CORR:CSET:RF:PORT CINP`

Set Correction Port for Correction 1 to apply to the currently selected input

`:CORR:CSET4:RF:PORT RRH1RFHD2`

Set Correction Port for Correction 4 to apply to Radio Head 1, RF Tx/Rx Port 2

Notes The **RF** node in this command is retained for backwards compatibility, even though the scope of the Correction Port command goes beyond the RF ports and includes BBIQ and External Mixing

Dependencies RFIN2|AIQ|EMIXer are only available on C/E/M/P/UXA analyzers with the appropriate options loaded
RFOut is only available on modular products such as VXT
ANT, GEN and TR are only available in VXT and only when the M9470A module is installed, such as in the M8920A. Option "HDX" is required to enable the TR port
RFHD and RFFD are only available on VXT, option HDX is required to enable RFHD port and option FDX is required to enable RFFD port
RFIO3 and RFIO4 are only available on EXM with hardware M9431A
RFIN and RFOut are not available on EXM with hardware M9431A
ERFIN requires option "EXW"

Preset Unaffected by Preset. Set as below by Restore Input/Output Defaults:

For VXT: **RFIN**

For EXM, EXF: **RFIO1**

For all other models: **CINPut** (the currently selected input)

State Saved Saved in State

Parameters, notes and examples. Note that the presence of these ports is highly hardware dependent.

Correction Port	Example	Note
Current Input	<code>:CORR:CSET:RF:PORT CINP</code>	The correction will be applied to whichever input is currently selected in the Input menu

Correction Port	Example	Note
RF Input	:CORR:CSET:RF:PORT RFIN	Main RF Port Not available on EXM with hardware M9431A
RF Input 2	:CORR:CSET:RF:PORT RFIN2	Second RF Port, labeled RF Input 2 Only available on certain instruments. Not available on modular instruments
BBIQ input	:CORR:CSET:RF:PORT AIQ	Requires option BBA Not available on modular instruments
External Mixer	:CORR:CSET:RF:PORT EMIX	Requires option EXM Not available on modular instruments
Antenna	:CORR:CSET:RF:PORT ANT	Antenna input port on M9470A, labeled Ant
Generator	:CORR:CSET:RF:PORT ANT	Generator output port on M9470A, labeled Gen
T/R	:CORR:CSET:RF:PORT TR	T/R port on M9470A, labeled T/R
RF Full Duplex	:CORR:CSET:RF:PORT RFFD	On modular instruments, labeled RFFD. Option "FDX" is required to enable RFFD port
RF Half Duplex	:CORR:CSET:RF:PORT RFHD	On modular instruments, labeled RFHD. Option "HDX" is required to enable RFHD port
A1	:CORR:CSET:RF:PORT A1	On E7760B
A2	:CORR:CSET:RF:PORT A2	On E7760B
A3	:CORR:CSET:RF:PORT A3	On E7760B
B1	:CORR:CSET:RF:PORT B1	On E7760B
B2	:CORR:CSET:RF:PORT B2	On E7760B
B3	:CORR:CSET:RF:PORT B3	On E7760B
IFIO1	:CORR:CSET:RF:PORT IFIO1	On E7760B
IFIO2	:CORR:CSET:RF:PORT IFIO2	On E7760B
RF Output	:CORR:CSET:RF:PORT RFO	Appears on some modular instruments Not available on EXM with hardware M9431A
RFIO1	:CORR:CSET:RF:PORT RFIO1	Appears on some modular instruments
RFIO2	:CORR:CSET:RF:PORT RFIO2	Appears on some modular instruments
RFIO3	:CORR:CSET:RF:PORT RFIO3	Only available in EXM with hardware M9431A
RFIO4	:CORR:CSET:RF:PORT RFIO4	Only available in EXM with hardware M9431A
GPS out	:CORR:CSET:RF:PORT GPS	Appears on some modular instruments

Correction Port	Example	Note
GNSS out	<code>:CORR:CSET:RF:PORT GNSS</code>	Appears on some modular instruments

6.5.4 Correction Direction

Selects whether corrections will be applied when the device associated with the specified correction is being used as an input, an output or in both directions. The choices are:

INPut	Correct the port only when the port is used as an Input
OUTPut	Correct the port only when the port is used as an Output
BOTH	Correct the port when the port is used as either an Input or an Output (or both)

A port that is only an Output is always corrected as an output if the Correction is On. A port that is only an Input is always corrected as an Input if the Correction is On. For a port that can be either an Input or an Output (or both), the Correction is determined by the Correction Direction setting. The default is **BOTH**, which means that by default a port that can be either an Input or an Output (or both) is corrected in both directions if the Correction is On.

Remote Command	<code>[:SENSe]:CORRection:CSET[1] 2 ... 16:DIRection INPut OUTPut BOTH [:SENSe]:CORRection:CSET[1] 2 ... 16:DIRection?</code>
Example	<code>:CORR:CSET2:DIR INP</code>
Dependencies	The Correction Direction control only appears when Correction Port selects a port that can either function as an input or an output (or both simultaneously), such as RFIO HD, RFFD or T/R. If the SCPI command is sent to any other port, it is accepted but ignored
Preset	Not affected by a Preset. Set to BOTH by Restore Input/Output Defaults
State Saved	Saved in State
Backwards Compatibility SCPI	The following SCPI results in the selection of BOTH (included for compatibility with early Multitouch implementations): <code>[:SENSe]:CORRection:CSET[1] 2 ... 8:DIRection BIDirectiona</code> included for compatibility with A-models modular products: <code>[:SENSe]:CORRection:CSET[1] 2 ... 8:RF:PORT:RFFD SOURce ANALyzer BOTH [:SENSe]:CORRection:CSET[1] 2 ... 8:RF:PORT:RFIO1 SOURce ANALyzer BOTH [:SENSe]:CORRection:CSET[1] 2 ... 8:RF:PORT:RFIO2 SOURce ANALyzer BOTH [:SENSe]:CORRection:CSET[1] 2 ... 8:RF:PORT:RFIO3 SOURce ANALyzer BOTH [:SENSe]:CORRection:CSET[1] 2 ... 8:RF:PORT:RFIO4 SOURce ANALyzer BOTH</code>

6.5.5 Edit Correction

Invokes the integrated editing facility for this correction set. When entering the menu, the editor window turns on, the selected correction is turned **On**, **Apply Corrections** is set to **On**, the amplitude scale is set to **Log**, and the Amplitude Correction (“Ampcor”) trace is displayed. The actual, interpolated correction trace is shown in green for the selected correction. Note that since the actual interpolated correction is shown, the correction trace may have some curvature to it. This trace represents only the correction currently being edited, rather than the total, accumulated amplitude correction for all amplitude corrections which are currently on, although the total, accumulated correction for all corrections which are turned on is still applied to the data traces.

Because corrections data is always in dB, but the Y-axis of the instrument is in absolute units, it is necessary to establish a reference line for display of the Corrections data. The reference line is halfway up the display and represents 0 dB of correction. It is labeled “0 dB CORREC”. It is drawn in blue. Corrections data is always in dB. Whatever dB value appears in the correction table represents the correction to be applied to that trace at that frequency. So, if a table entry shows 30 dB that means we ADD 30 dB to each trace to correct it before displaying it. By definition all points are connected. If a gap is desired for corrections data, enter 0 dB.

Note that a well-designed Corrections array should start at 0 dB and end at 0 dB. This is because whatever the high-end point is will be extended to the top frequency of the instrument, and whatever the low-end point is will be extended down to 0 Hz. So, for a Corrections array to have no effect outside its range, you should start and end the array at 0 dB.

NOTE

The table editor only operates properly if the instrument is sweeping, because its updates are tied to the sweep system. Thus, you should not try to use the editor in single sweep, and its response will be sluggish during compute-intensive operations like narrow-span FFT sweeps.

When exiting the edit menu (by using the **Return** key or by pressing an instrument front-panel key), the editor window turns off and the Ampcor trace is no longer displayed; however, **Apply Corrections** remains **On**, any correction that was on while in the editor remains on, and the amplitude scale returns to its previous setting.

Corrections arrays are not affected by a Preset, because they are in the Input/Output system. They also survive shutdown and restarting of the instrument application, which means they will survive a power cycle.

When editing a correction, the editor remembers which correction and which element in the correction array you were editing, and returns you to that correction and that element when you return to the editor after leaving it.

6.5.5.1 Select Correction

Specifies the selected correction. The term "selected correction" is used throughout this document to specify which correction will be affected by the functions.

Notes	The selected correction is remembered even when not in the correction menu
Preset	Set to Correction 1 by Restore Input/Output Defaults

6.5.5.2 Frequency

Touching a frequency value makes the touched row the current row and lets you edit the frequency.

Min	0
Max	1 THz

6.5.5.3 Amplitude

Touching an amplitude value makes the touched row the current row and lets you edit the amplitude.

Min	-1000 dB
Max	1000 dB

6.5.5.4 Go to Row

Lets you move through the table to edit the desired point.

Min	1
Max	2000

6.5.5.5 Insert Row Below

Inserts a point below the current point. The new point is a copy of the current point and becomes the current point. The new point is not yet entered into the underlying table, and the data in the row is displayed in light gray. To enter the row into the table, press the Enter key, or tap either value and edit it.

6.5.5.6 Delete Row

Deletes the currently-selected point, whether or not that point is being edited, and selects the Navigate functionality. The point following the currently-selected point (or the point preceding if there is none) will be selected.

6.5.5.7 Scale X Axis

Matches the X-Axis to the selected Correction, as well as possible. Sets the Start and Stop Frequency to contain the minimum and maximum Frequency of the selected Correction. The range between Start Frequency and Stop Frequency is 12.5% above the range between the minimum and maximum Frequency, so that span exceeds this range by one graticule division on either side. If in zero-span, or there is no data in the Ampcor table, or the frequency range represented by the table is zero, no action is taken. Standard clipping rules apply if the value in the table is outside the allowable range for the X-Axis.

Dependencies	If either the first or last point in the array is outside the frequency range of the current input, an error message is generated: “-221. Settings conflict; Start or Stop Freq out of range for current input settings”
--------------	---

6.5.5.8 Delete Correction

Deletes the correction values for this set. When this key is pressed, a prompt appears on the screen saying “Please press **Enter** or **OK** key to delete correction. Press **ESC** or **Cancel** to close this dialog.” The deletion is only performed if you press **OK** or **Enter**.

Remote Command	<code>[:SENSe]:CORRection:CSET[1] 2 ... 16:DElete</code>
----------------	---

Example	<code>:CORR:CSET:DEL</code> <code>:CORR:CSET1:DEL</code> <code>:CORR:CSET4:DEL</code>
---------	---

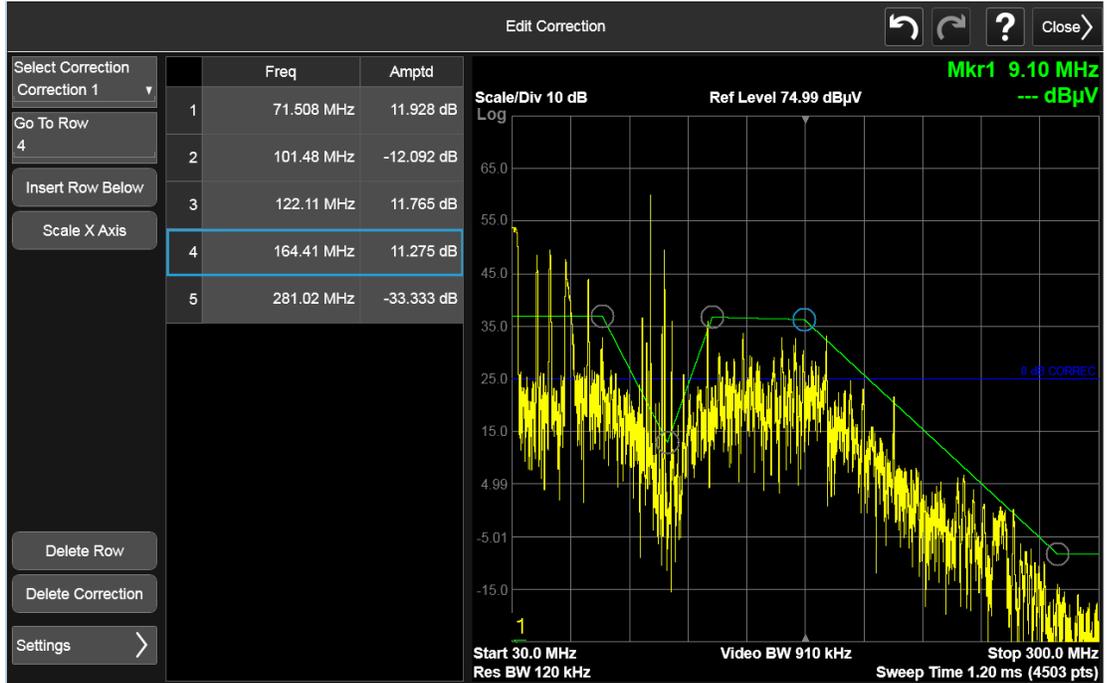

Notes	Pressing this key when no corrections are present is accepted without error
-------	---

6.5.5.9 Correction Graph

The **Correction Graph** embedded in the Edit Correction dialog lets you edit the Amplitude Correction visually. Each node in the Correction is represented by a gray circle. The current node has a blue outline in the table and a blue circle in the graph. Touch any circle and drag it where you want it to go.

6 Input/Output

6.5 Corrections

6.5.6 Edit Correction Settings

Opens another menu page that lets you set certain properties of the selected correction, such as Interpolation, Transducer Unit, Description and Comment.

6.5.6.1 Select Correction

Specifies the selected correction. The term "selected correction" is used throughout this document to specify which correction will be affected by the functions.

Notes	The selected correction is remembered even when not in the correction menu
Preset	Set to Correction 1 by Restore Input/Output Defaults

6.5.6.2 Freq Interpolation

Controls how the correction values per-bucket are calculated. We interpolate between frequencies in either the logarithmic or linear scale.

This setting is handled and stored individually per correction set.

VXT models SP900B/11A/15A/16A only support Linear Interpolation. For more details, see ["Interpolation" on page 3085](#)

Remote Command	<code>[:SENSe]:CORRection:CSET[1] 2 ... 16:X:SPACing LINear LOGarithmic</code>
Example	<code>:CORR:CSET:X:SPAC LIN</code>
Preset	Unaffected by a Preset. Set to Linear by Restore Input/Output Defaults
State Saved	Saved in instrument state

Interpolation

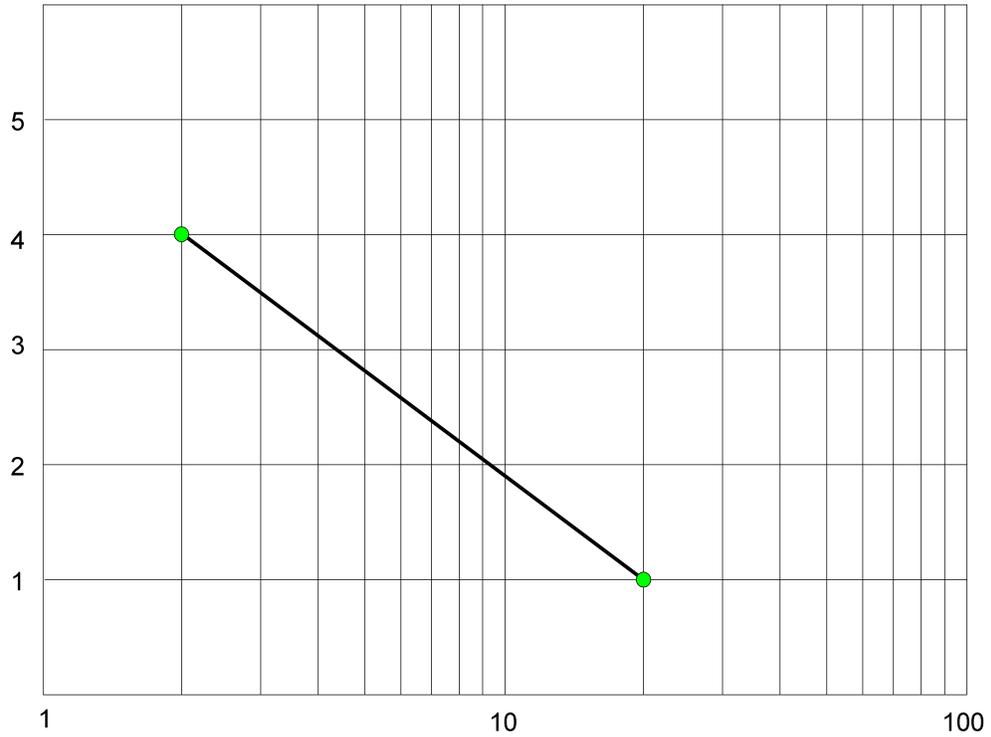

For each bucket processed by the application, all of the correction factors at the frequency of interest (center frequency of each bucket) are summed and added to the amplitude. All trace operations and post processing treat this post-summation value as the true signal to use.

To effect this correction, the goal, for any particular start and stop frequency, is to build a correction trace, whose number of points matches the current Sweep Points setting of the instrument, which will be used to apply corrections on a bucket-by-bucket basis to the data traces.

For amplitudes that lie between two user specified frequency points, we interpolate to determine the amplitude value. You may select either linear or logarithmic interpolation between the frequencies.

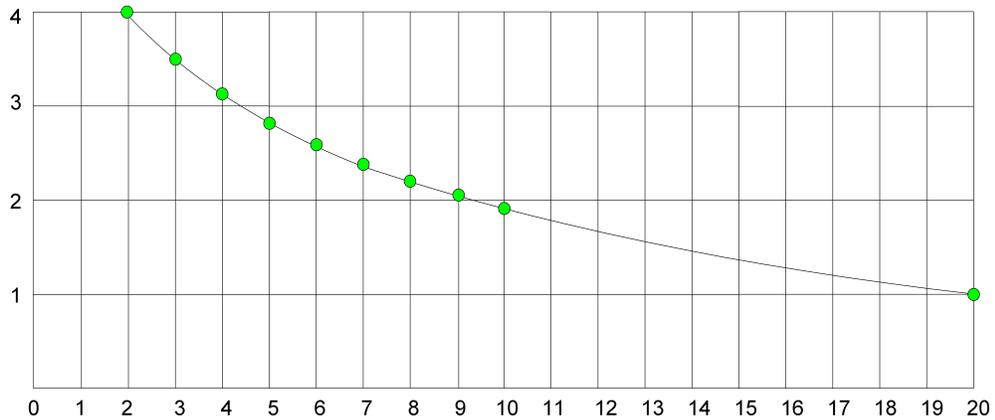

If we interpolate on a log scale, we assume that the line between the two points is a straight line on the log scale. For example, let's say the two points are (2,4) and (20,1). A straight line between them on a log scale looks like:

6 Input/Output
6.5 Corrections

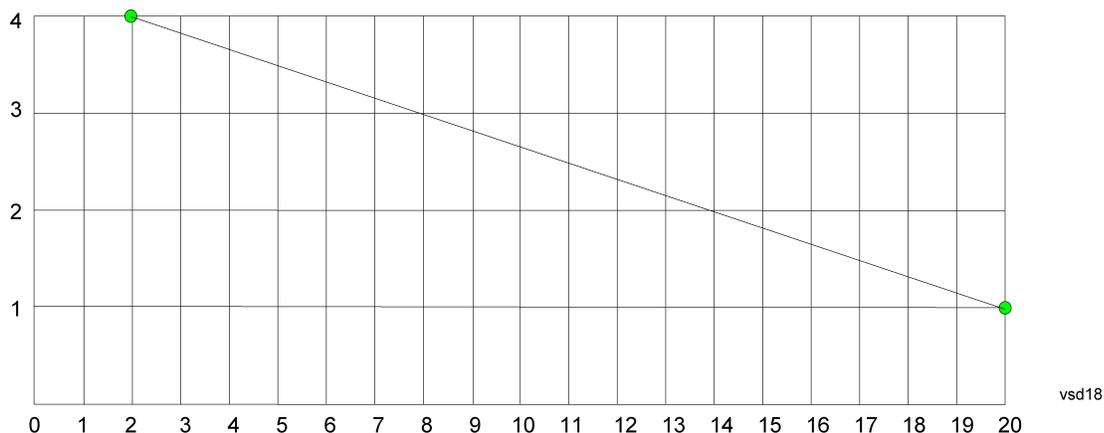

vsd17

On a linear scale (like that of the spectrum analyzer), this translates to:

vsd19

If we interpolate on a linear scale, we assume that the two points are connected by a straight line on the linear scale, as below:

The correction to be used for each bucket is taken from the interpolated correction curve at the center of the bucket.

6.5.6.3 Transducer Unit

For devices (like antennas) that make measurements of field strength or flux density, the correction array should contain within its values the appropriate conversion factors such that, when the data on the instrument is presented in dBμV, the display is calibrated in the appropriate units. The "Transducer Unit" used for the conversion is contained within the corrections array database. It may be specified or loaded in from an external file or SCPI.

When an array with a Transducer Unit other than "None" is turned on, the Y Axis Unit of the instrument is forced to that unit. When this array is turned on, and it contains a Transducer Unit other than "None", the Y Axis Unit of the instrument is forced to that Transducer Unit., and all other Y Axis Unit choices are grayed out.

Transducer Unit only appears in certain Modes, it does not appear in all Modes that support Corrections.

See ["Examples" on page 3088](#)

Remote Command	<code>[:SENSe]:CORRection:CSET[1] 2 ... 16:ANTenna[:UNIT] GAUSS PTES1a UVM UAM UA NOConversion [:SENSe]:CORRection:CSET[1] 2 ... 16:ANTenna[:UNIT]?</code>
Example	<code>:CORR:CSET:ANT GAUS</code>
Dependencies	Only one Transducer units can be on at any given time. Note that this means that if a correction file with a Transducer Unit is loaded into a particular Correction, all other Corrections are set to that same Transducer unit When Normalize is On (in the Trace, Normalize menu) Transducer Unit is grayed out and forced to None
Preset	Unaffected by Preset. Set to NOC by Restore Input/Output Defaults
State Saved	Saved in instrument state

Examples

The units that may be specified and what appears in the file and on the screen are shown below:

Transducer Unit	SCPI Example	In the Correction file	On the screen (also Y Axis Unit forced to)
dB μ V/m	:CORR:CSET:ANT UVM	Antenna Unit= μ V/m	dB μ V/m
dB μ A/m	:CORR:CSET:ANT UVA	Antenna Unit= μ A/m	dB μ A/m
dB μ A	:CORR:CSET:ANT UA	Antenna Unit= μ A	dB μ A
dBpT	:CORR:CSET:ANT PTES	Antenna Unit=pTesla	dBpT
DBG	:CORR:CSET:ANT GAUS	Antenna Unit=Gauss	DBG
None	:CORR:CSET:ANT NOC	Antenna Unit= (or no line at all)	none (not forced)

6.5.6.4 Description

Sets an ASCII description field which will be stored in an exported file. Can be displayed in the active function area by selecting as the active function, if desired to appear in a screen capture.

Remote Command	<code>[:SENSe]:CORRection:CSET[1] 2 ... 16:DESCription "text"</code> <code>[:SENSe]:CORRection:CSET[1] 2 ... 16:DESCription?</code>
Example	<code>:CORR:CSET1:DESC "11941A Antenna correction"</code>
Notes	45 chars max; may not fit on display if max chars used
Preset	Unaffected by a Preset. Set to empty by Restore Input/Output Defaults
State Saved	Saved in instrument state

6.5.6.5 Comment

Sets an ASCII comment field which will be stored in an exported file. Can be displayed in the active function area by selecting as the active function, if desired to appear in a screen capture.

Remote Command	<code>[:SENSe]:CORRection:CSET[1] 2 ... 16:COMMeNt "text"</code> <code>[:SENSe]:CORRection:CSET[1] 2 ... 16:COMMeNt?</code>
----------------	--

Example	<code>:CORR:CSET1:COMM "this is a comment"</code>
Notes	60 chars max; may not fit on display if max chars used
Preset	Unaffected by Preset. Set to empty by Restore Input/Output Defaults
State Saved	Saved in instrument state

6.5.7 Complex Corrections

This dialog is used to set up and display information about the **Complex Corrections** set. It also lets you view and edit certain information such as the Description and Comment for the selected Complex Correction.

Complex Corrections (loaded from `.s2p` files) support both magnitude and phase corrections, whereas standard corrections (loaded from standard Ampcor `.csv` files) support only magnitude corrections.

When loading an `.s2p` file, the component representing S21 is the one that is used to generate the complex correction. If no S21 component is present, a Mass Storage error is reported.

NOTE

Data types RI, MA, and DB are supported.

The phase components of the S2P file are taken to be in degrees, not in radians. You must provide the phase correction in degrees.

Unlike Correction files, S2P files describe device characteristics, rather than the correction required to compensate for those characteristics; so, when an S2P file is loaded, both the magnitude and phase are negated to turn it into a correction

Complex Corrections and standard corrections can be turned on at the same time. For example, you could turn on Correction 2, Correction 4, and Complex Correction 1 and 2, all at the same time. The magnitude part of all the corrections would add, and the phase part of the complex corrections would add.

You can have up to 64 Complex Corrections loaded simultaneously. Each Complex Correction can hold up to 30,000 points.

You can load a standard correction into Complex Corrections, but it will only provide a magnitude correction, not a phase correction.

NOTE

A standard correction (from a CSV file) can be loaded into a Complex Correction, but when it is loaded the Phase correction is set to 0 for all points.

Some measurements, like Swept SA, have no phase component to the measurement, but nonetheless support Complex Corrections. For such measurements, only the Magnitude part of the Complex Correction is applied.

6.5.7.1 Go To Row (Select Correction)

Specifies the selected complex correction. The selected correction will be identified by the blue outlined row in the dialog.

The "selected complex correction" is an important concept when sending SCPI commands to the Complex Corrections system, because in each case the SCPI command is directed to the currently selected Complex Correction and that will be the Correction which is modified by the SCPI command.

Remote Command	<code>[:SENSe]:CCORrection:CSET:SElect <integer></code> <code>[:SENSe]:CCORrection:CSET:SElect?</code>
Example	<code>:CCOR:CSET:SEL 3</code> <code>:CCOR:CSET:SEL?</code>
Notes	The selected correction is remembered even when not in the correction menu
Preset	Set to Correction 1 by Restore Input/Output Defaults
Min	1
Max	64

6.5.7.2 Delete Row

Deletes the currently-selected Complex Correction and clears all entries in that row to the default.

Remote Command	<code>[:SENSe]:CCORrection:CSET:DElete</code>
Example	Select correction 3: <code>:CCOR:CSET:SEL 3</code> Delete correction 3: <code>:CCOR:CSET:DEL</code>

6.5.7.3 Delete All

Deletes all complex corrections and clears all entries in all rows to the default.

When this key is pressed a prompt is placed on the screen that says "Please press Enter or OK key to delete all complex corrections. Press ESC or Cancel to close this dialog." The deletion is only performed if you press **OK** or **Enter**.

Remote Command	<code>[:SENSe]:CCORrection:CSET:ALL:DElete</code>
Example	<code>:CCOR:CSET:ALL:DEL</code>

6.5.7.4 Correction On

Checking or unchecking this box turns the Selected Complex Correction **ON** or **OFF**. Turning it **ON** causes the values in it to be applied to the data. This state transition also automatically turns on "Apply Corrections" (sets it to **ON**), otherwise the correction would not take effect.

A new sweep/acquisition is initiated if a complex correction is switched on or off. Note that changing, sending or loading corrections data does *not* directly initiate a sweep, however in general these operations will turn corrections on, which *does* initiate a sweep.

Remote Command	<code>[:SENSe]:CCORrection:CSET[:STATe] ON OFF 1 0</code> <code>[:SENSe]:CCORrection:CSET[:STATe]?</code>
Example	Select correction 3: <code>:CCOR:CSET:SEL 3</code> Turn correction 3 on: <code>:CCOR:CSET ON</code>
Dependencies	Changing this from OFF to ON automatically turns on "Apply Corrections" Grayed-out if Complex Corrections is not supported by the current measurement. A warning or SCPI error is generated if you try to turn it on under these circumstances: "Feature not supported for this measurement"
Preset	Not affected by Preset. Set to OFF by Restore Input/Output Defaults
State Saved	Saved in instrument state
Annotation	If <i>any</i> Complex Correction is turned on, CC in the Meas Bar will display in amber to indicate Complex Corrections are in use

6.5.7.5 Correction Port

Maps one of the sets of corrections to a particular I/O port. This control allows any Input port (including External Mixing, BBIQ, the RF2 input, etc.) to be mapped to a specific Correction, so that the Correction is only applied when that Port is being used by the current Screen. You can also map any internal source Output port to a specific Correction.

When Current Input (CINPut) is selected for **Correction Port**, it chooses the current input port of the current Screen for the selected Correction. In other words, the Correction applies to whichever input is selected. If the input changes, the correction applies to the new input.

When using the VXT SP900B/11A with Remote Radio Heads (such as the Keysight M1740A mmWave Transceiver for 5G), the choices in the dropdown menu will appear as

Head h RFHD p

For example, if you have two Radio Heads (numbered 1 and 2), each of which have two RF half duplex ports, the choices for these ports will appear as below:

Head and Port	Choice in dropdown	SCPI parameter
Head 1, port RF Tx/Rx 1	Head 1 RFHD 1	RRH1RFHD1
Head 1, port RF Tx/Rx 2	Head 1 RFHD 2	RRH1RFHD2
Head 2, port RF Tx/Rx 1	Head 2 RFHD 1	RRH2RFHD1
Head 2, port RF Tx/Rx 2	Head 2 RFHD 2	RRH2RFHD2

See also the parameters, notes and examples table under "[Correction Port](#)" on [page 3077](#).

Remote Command	<pre>[:SENSe]:CCORrection:CSET:PORT CINPut RFIN RFIN2 AIQ EMIXer RFOut RFIO1 RFIO2 RFIO3 RFIO4 RFHD RFFD ANT GEN TR A1 A2 A3 B1 B2 B3 IFIO1 IFIO2 RRHnRFHD ERFIN [:SENSe]:CCORrection:CSET:PORT?</pre>
Example	<pre>:CCOR:CSET:SEL 2</pre> <p>Select correction 2</p> <pre>:CCOR:CSET:PORT RFIN</pre> <p>Set correction 2 to RFIN</p> <pre>:CCOR:CSET:PORT RRH1RFHD2</pre> <p>Set Correction 2 to Radio Head 1, RF Tx/Rx Port 2</p>
Dependencies	<p>RFIN2 AIQ EMIXer are only available on C/E/M/P/UXA analyzers with the appropriate options loaded</p> <p>RFOut is only available on modular products such as VXT</p> <p>ANT, GEN and TR are only available in VXT and only when the M9470A module is installed, such as in the M8920A. Option "HDX" is required to enable the TR port</p> <p>RFHD and RFFD are only available on VXT, option HDX is required to enable RFHD port and option FDX is required to enable RFFD port</p> <p>RFIO3 and RFIO4 are only available on EXM with hardware M9431A</p> <p>RFIN and RFOut are not available on EXM with hardware M9431A</p> <p>ERFIN requires option "EXW"</p>
Preset	Not affected by Preset. Set to CINPut by Restore Input/Output Defaults
State Saved	Saved in State

6.5.7.6 Direction

Selects whether corrections will be applied when the device associated with the specified correction is being used as an input, an output or in both directions. The choices are:

INPut	Correct the port only when the port is used as an Input
OUTPut	Correct the port only when the port is used as an Output
BOTH	Correct the port when the port is used as either an Input or an Output (or both)

Remote Command	<code>[:SENSe]:CCORrection:CSET:DIRection INPut OUTPut BOTH</code> <code>[:SENSe]:CCORrection:CSET:DIRection?</code>
Example	<code>:CCOR:CSET:SEL 4</code> Select correction 4 <code>:CCOR:CSET:DIR INP</code> Set correction 4 to Input
Dependencies	For Inputs, the only choice is INPut , so an empty table cell is displayed. For Outputs, the only choice is OUTPut , so an empty table cell is displayed. If the SCPI command is sent while one of these ports is selected, it is accepted but ignored For a port that can be either an Input or an Output (or both), such as RFHD, RFFD or T/R, all three choices are available
Preset	Not affected by a Preset. Set to BOTH by Restore Input/Output Defaults
State Saved	Saved in State
Backwards Compatibility SCPI	The following SCPI will result in the selection of BOTH (included for compatibility with early Multitouch implementations): <code>[:SENSe]:CCORrection:CSET:DIRection BIDirectiona</code>

6.5.7.7 Description

Shows the Description field for the selected Complex Correction. The Description field is loaded from the second line of the `.s2p` file. (Note that, if line 2 begins with “!”, the ! is not displayed in the Description field.)

Remote Command	<code>[:SENSe]:CCORrection:CSET:DESCription "text"</code> <code>[:SENSe]:CCORrection:CSET:DESCription?</code>
Example	<code>:CCOR:CSET:SEL 4</code> Select correction 4 <code>:CCOR:CSET:DESC "PNA data import 1-1-18"</code>
Notes	45 chars max; may not fit on display if max chars used
Preset	Unaffected by Preset. Set to empty by Restore Input/Output Defaults
State Saved	Saved in instrument state

6.5.7.8 Comment

Shows the Comment field for the selected Complex Correction. The Comment field is loaded from the third line of the `.s2p` file. (Note that, if line 3 begins with “!”, the ! is not displayed in the Comment field.)

Remote Command	<code>[:SENSe]:CCORrection:CSET:COMMeNt "text"</code> <code>[:SENSe]:CCORrection:CSET:COMMeNt?</code>
----------------	--

Example	<code>:CCOR:CSET:SEL 4</code> Select correction 4 <code>:CCOR:CSET:COMM "this is a comment"</code>
Notes	60 chars max; may not fit on display if max chars used
Preset	Unaffected by Preset. Set to empty by Restore Input/Output Defaults
State Saved	Saved in instrument state

6.5.7.9 File

Shows the file from which the selected correction was loaded. If correction was loaded with a SCPI command (see ["Set Data \(Remote Command Only\)" on page 3094](#)) displays "(SCPI)". If no correction is loaded, displays "(No correction loaded)"

Notes	60 chars max; may not fit on display if max chars used
State Saved	Saved in instrument state

6.5.7.10 Freq Interpolation (Remote Command Only)

Controls how the correction values per-bucket are calculated. We interpolate between frequencies in either the logarithmic or linear scale.

This setting is handled and stored individually per correction set.

VXT models SP900B/11A/15A/16A only support Linear Interpolation.

See ["Interpolation" on page 3085](#) under Corrections.

Remote Command	<code>[:SENSe] :CCORrection :CSET : X : SPACing LINear LOGarithmic</code> <code>[:SENSe] :CCORrection :CSET : X : SPACing ?</code>
Example	Select correction 4: <code>:CCOR:CSET:SEL 4</code> Set linear interpolation: <code>:CCOR:CSET:X:SPAC LIN</code>
Preset	Unaffected by Preset. Set to Linear by Restore Input/Output Defaults
State Saved	Saved in instrument state

6.5.7.11 Set Data (Remote Command Only)

Allows you to set the magnitude part of a complex correction's data via a SCPI command. This is provided for compatibility with the similar command for standard corrections, to allow you to use Complex Corrections as an extension to standard corrections.

Sending this command sets the phase part of the selected correction to 0 for all points.

The command takes an ASCII series of alternating frequency and amplitude points, each value separated by commas.

The values sent in the command will totally replace all existing correction points in the specified set.

A Complex Correction array can contain 30000 points maximum.

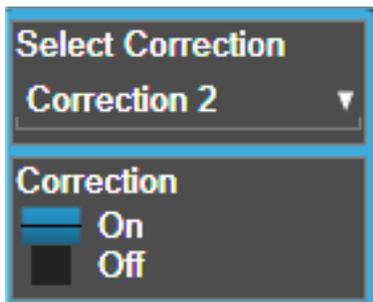

Remote Command	<code>[:SENSe]:CCORrection:CSET:DATA <freq>, <ampl>, ...</code> <code>[:SENSe]:CCORrection:DATA?</code>
Example	<code>:CCOR:CSET:SEL 4</code> Select correction 4 <code>:CCOR:CSET:DATA 10000000, -1.0, 20000000, 1.0</code> This defines two correction points at (10 MHz, -1.0 dB) and (20 MHz, 1.0 dB) for correction set 4
Preset	Empty after Restore Input/Output Defaults. Survives a shutdown or restart of instrument application (including a power cycle)
State Saved	Saved in instrument state
Min	Freq: 0 Hz Amptd: -1000 dBm
Max	Freq: 1 THz Amptd: +1000 dBm

6.5.8 Apply Corrections

When you turn on Apply Corrections, all of the Corrections that are turned On are applied to the measured data. When you turn off Apply Corrections, no Corrections are applied, even if they are turned On.

With this switch you can turn the entire Corrections system on and off without affecting the settings of any individual Corrections. Turning Apply Corrections On and Off has no effect on the On/Off switches under the individual Corrections.

Apply Corrections affects both normal Corrections and Complex Corrections. Normal Corrections are turned On and Off using the Correction switch under Select Correction:

Complex Corrections are turned On and Off using the checkboxes in the Complex Corrections dialog:

Correction	On	Port	Direction	
1	<input checked="" type="checkbox"/>	Current Input	Input	D
2	<input type="checkbox"/>	Current Input	Input	

See "[Correction On/Off](#)" on page 3077) and "[Complex Corrections](#)" on page 3089.

Remote Command	<code>[:SENSe]:CORRection:CSET:ALL[:STATe] ON OFF 1 0</code> <code>[:SENSe]:CORRection:CSET:ALL[:STATe]?</code>
Example	<code>:SENS:CORR:CSET:ALL OFF</code> This command makes sure that no amplitude corrections are applied, regardless of their individual on/off settings
Couplings	Whenever you turn on any Correction or Complex Correction, Apply Corrections is automatically set to ON
Preset	Not affected by Preset. Set to OFF by Restore Input/Output Defaults
State Saved	Saved in instrument state
Annunciation	When ON , 'CORREC' appears in the Meas Bar as long as at least one of the individual corrections is enabled

6.5.9 Delete All Corrections

Erases all correction values for all Amplitude Correction sets and Complex Corrections.

When this key is pressed a prompt is placed on the screen that says "Please press Enter or OK key to delete all corrections. Press ESC or Cancel to close this dialog." The deletion is only performed if you press **OK** or **Enter**.

Remote Command `[:SENSe]:CORRection:CSET:ALL:DELeTe`

Example `:CORR:CSET:ALL:DEL`

6.5.10 Correction Group On/Off

Turns the Correction Group on and off. The Correction Group allow you to preload Correction files and associate them with specific frequency ranges, so that they can be switched in and out during a sweep at the appropriate frequencies. Use the control “Edit Correction Group” below to set up your Correction Group.

The state of each Correction will be set dynamically depending on the active measurement frequency. Only the correction selected for the range that matches the active measurement frequency will be turned on, and vice versa.

Note that the Corrections in the Correction Group, although they are loaded into memory, are independent of the main Correction registers at the top of the Corrections menu, and will not display under the Select Correction, Correction On/Off or Edit Correction functions.

Remote Command `[:SENSe]:CORRection:CSET:GRoup[:STATe] ON | OFF | 1 | 0`

`[:SENSe]:CORRection:CSET:GRoup[:STATe]?`

Example `:SENS:CORR:CSET:GRO ON`

Dependencies Correction group is supported in EMI Receiver Mode, and in Spectrum Analyzer Mode if option EMC or EMI Receiver Mode is present. If you switch to other measurements or modes, correction group is turned off and the Correction Group functions are not visible

Couplings When on, Correction 1 through 8 is set to **OFF** and the correction on/off state keys are grayed out. If the grayed-out key is pressed, it generates an advisory message. If sending the SCPI to turn it on, this same message is generated as part of Settings conflict

Preset Not affected by Preset. Set to OFF by **Restore Input/Output Defaults**

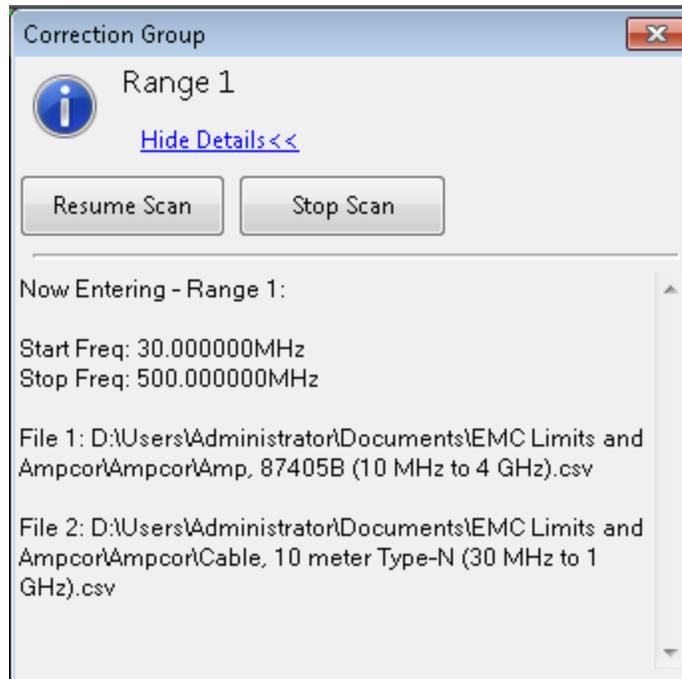

State Saved Saved in instrument state

6.5.11 Break

If break is turned on, the scan or sweep will be paused when it reaches the boundary of correction group ranges. At the same time, a window at the size of ~ 6.5cm x 3.5 cm is prompt at the upper right-hand corner of the graticule.

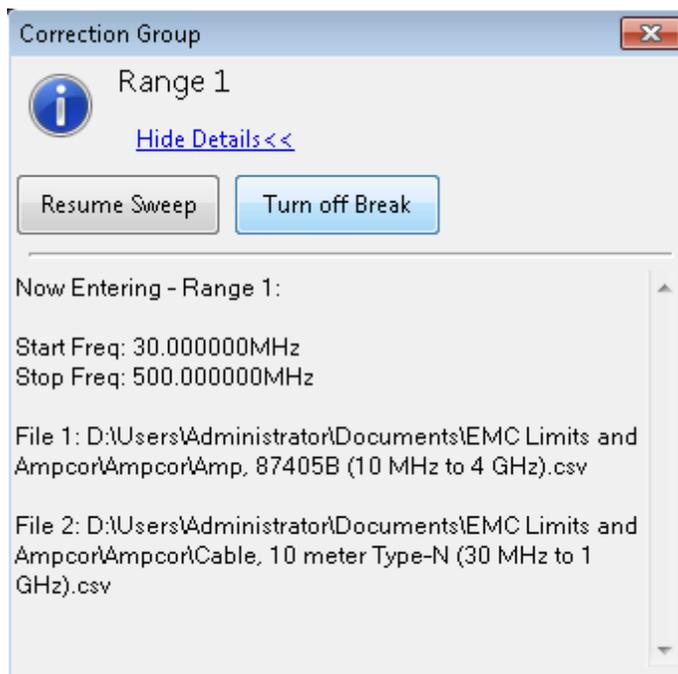

When running Frequency Scan measurement of Emi Receiver application, the message prompt is like below. You are given the option to resume the scan or stop the scan.

6 Input/Output
6.5 Corrections

When running the Swept SA measurement in Spectrum Analyzer Mode, the message prompt is as below. You are given the option to resume the sweep or turn off the break. If in Continuous sweep, the sweep will resume after the break is turned off.

Remote Command	<code>[:SENSe] :CORRection:CSET:GROup:BRak ON OFF 1 0</code> <code>[:SENSe] :CORRection:CSET:GROup:BRak?</code>
Example	<code>:SENS:CORR:CSET:GRO:BR ON</code>
Notes	<p>When running the Frequency Scan measurement in EMI Receiver Mode, if break is turned on when a SCPI is sent to start the scan, the scan pauses when it reaches the boundary of correction group ranges. Bit 8 (Paused) of status operation register is set to true. To resume, send <code>:INITiate2:RESume</code>. To stop the scan, send <code>:ABORt</code></p> <p>When running the Swept SA measurement in Spectrum Analyzer Mode, the break state does not affect the operation of sweep when SCPI to control the sweep is sent. Instead, the SCPI commands close the message prompt if it is showing at the point the commands are sent, and the break is turned off. The SCPI includes:</p> <pre> :INITitate:IMMEdiate :INITitate:REStart :INITitate:CONTinuous ON OFF 1 0 :ABORt </pre>
Dependencies	Correction group is supported in EMI Receiver Mode, and in Spectrum Analyzer Mode if option EMC or EMI Receiver mode is present. If you switch to other measurements or modes, correction group is turned off and the Correction Group functions (like Break) are not visible
Preset	Not affected by Preset. Set to OFF by Restore Input/Output Defaults
State Saved	Saved in instrument state

6.5.12 Reload Corrections From Files

Because the Correction data for the Correction Group is loaded into memory from Correction files at the time the Group is defined, it will be necessary to reload some or all of the data if any of the files changes. This function reloads all of the correction data from all of the correction files defined in all of the ranges in the Correction Group.

Remote Command	<code>[:SENSe] :CORRection :CSET :GR0up :RELoad</code>
Example	<code>:MMEM :STOR :CORR :GRO :REL</code>
Notes	If invalid data is found in the files, the correction group will be set to off and an Execution error is generated. Error icon appears on the status column correction group table
Dependencies	Correction group is supported in EMI Receiver Mode, and in Spectrum Analyzer mode if option EMC or EMI Receiver Mode is present. If you switch to other measurements or modes, correction group is turned off and the Correction Group functions (like Reload Correction From File) are not visible
Annotation	If reload fails, error icons appear in the status column of correction group editor for the range that has the error

6.5.13 Edit Correction Group

Opens the Table Editor for the correction group. The content of correction group table including the correction data loaded from the files is not affected by a Preset, it survives power cycle. You can set it to empty by restore Input/Output Defaults.

Dependencies	Correction group is supported in EMI Receiver Mode, and in Spectrum Analyzer Mode if option EMC or EMI Receiver Mode is present. If you switch to other measurements or modes, correction group is turned off and the Correction Group functions (like Edit Correction Group) are not visible
--------------	---

6.5.13.1 Go to Row

Lets you move through the table to edit the desired point.

Min	1
Max	2000

6.5.13.2 Insert Row Below

Inserts a point below the current point. The new point starts from the current range stop frequency and becomes the current point. The new point is not yet entered into the underlying table, and the data in the row is displayed in light gray.

6.5.13.3 Delete Row

Deletes the currently-selected point, whether or not that point is being edited, and selects the Navigate functionality. The point following the currently-selected point (or the point preceding if there is none) will be selected.

6.5.13.4 Select File

Indicate the correction files in which the specify file and remove file operations will take effect.

Notes	No SCPI. Front panel only
Preset	Unaffected by a Preset. Set to empty by Restore Input/Output Defaults

6.5.13.5 Specify File

Displays the file browsing menu. When a file is selected, correction data will be loaded from the file. The correction data remains until the file is removed or the range is deleted.

Notes	<p>If the file is empty, error -250 is reported. If the file does not exist error -256 is reported. If there is a mismatch of data type, error -250 is reported</p> <p>Only one file with antenna unit can be supported per range. If you try to add another file which contains an antenna unit, a Mass Storage error is generated</p> <p>All ranges have to use a common antenna unit. If you try to add a correction file that contains a different antenna unit, a Mass Storage error is generated</p> <p>If you try to add a correction file that contains data that does not cover the range frequency, the file cannot be added, and an Execution error is generated</p>
-------	---

6.5.13.6 Remove File

Removes the selected file. When a file is removed, correction data for that file will be removed as well.

Dependencies	The key is grayed-out if there the file has not been specified. If the grayed-out key is pressed, an advisory message is generated
--------------	--

6.5.13.7 Correction Trace Display

Enables you to view the correction traces of all corrections that are added to the range currently selected. A 2-column table in the function of frequency and the accumulated amplitude correction is displayed at the left pane.

Notes	No SCPI. Front panel only
Preset	OFF
State Saved	Saved in instrument state

6.5.13.8 Description

Provides a description of up to 60 characters by which you can easily identify the correction group. The descriptions will be stored in the exported file and can be displayed in the active function area by selecting them as the active function, if desired to be in a saved screen dump.

Remote Command	<code>[:SENSe]:CORRection:CSET:GROup:DESCRiption "text"</code>
Example	<code>:CORR:CSET:GRO:DESC "Radiated Setup"</code>
Notes	60 chars max; may not fit on display if max chars used
Preset	Unaffected by a Preset. Set to empty by Restore Input/Output Defaults
State Saved	Saved in instrument state

6.5.13.9 Comment

Provides a comment of up to 60 characters by which you can easily identify the correction group. The comments will be stored in the exported file and can be displayed in the active function area by selecting them as the active function, if desired to be in a saved screen dump.

Remote Command	<code>[:SENSe]:CORRection:CSET:GROup:COMMeNt "text"</code>
Example	<code>:CORR:CSET:GRO:COMM "For internal only"</code>
Notes	60 chars max; may not fit on display if max chars used
Preset	Unaffected by a Preset. Set to empty by Restore Input/Output Defaults
State Saved	Saved in instrument state

6.5.13.10 Start Frequency

Touching a **Start Frequency** value makes the touched row the current row and lets you edit the start frequency.

Notes	You cannot set the Start Frequency to a value greater than Stop Frequency or equal to Stop Frequency. You cannot set the Start Frequency to a value that would create a span of less than 10 Hz. If you try to do any of these, the Stop Frequency will change to maintain a minimum span of 10 Hz
-------	--

	<p>If you change the Start Frequency of the selected range to a value smaller than the previous range's Stop Frequency, the Stop Frequency of the previous range will be changed to the same value</p> <p>If you change the Start Frequency of the selected range to a value out of the correction data frequency range, an error icon appears on the status column and an Execution error is generated</p>
Preset	Unaffected by Preset. Set to empty by Restore Input/Output Defaults
Min	0
Max	1 THz

6.5.13.11 Stop Frequency

Touching a **Stop Frequency** value makes the touched row the current row and lets you edit the stop frequency.

Notes	<p>You cannot set the Stop Frequency to a value greater than Start Frequency or smaller than Start Frequency. You cannot set the Stop Frequency to a value that would create a span of less than 10 Hz. If you try to do any of these, the Start Frequency will change to maintain a minimum span of 10 Hz</p> <p>If you change the Stop Frequency of the selected range to a value greater the next range's Start Frequency, the Start Frequency of the next range will be changed to the same value</p> <p>If you change the Stop Frequency of the selected range to a value out of the correction data frequency range, an error icon appears on the status column and an Execution error is generated</p>
Preset	Unaffected by Preset. Set to empty by Restore Input/Output Defaults
Min	0
Max	1 THz

6.5.14 Merge Correction Data (Remote Command Only)

Accepts an ASCII series of alternating frequency and amplitude points, each value separated by commas. The difference between this command and **Set Data** is that this merges new correction points into an existing set.

If any new point has the same frequency as an existing correction point, the existing point's amplitude is replaced by that of the new point.

An Ampcor array can contain 2000 total points, maximum.

Remote Command	<code>[:SENSe]:CORRection:CSET[1] 2 ... 16:DATA:MERGe <freq>, <amp1>, ...</code>
Example	<p><code>:CORR:CSET1:DATA:MERGE 15000000,-5.0,25000000,5.0</code></p> <p>This adds two correction points at (15 MHz, -5.0 dB) and (25 MHz, 5.0 dB) to whatever values already exist in correction set 1</p>
Preset	Empty after Restore Input/Output Defaults . Survives shutdown/restart of instrument application (including power cycle)

Min	Freq: 0 Hz Amptd: -1000 dBm
Max	Freq: 1 THz Amptd: +1000 dBm

6.5.15 Set (Replace) Data (Remote Command Only)

Accepts an ASCII series of alternating frequency and amplitude points, each value separated by commas.

The values sent in the command totally replace all existing correction points in the specified set.

An Ampcor array can contain 2000 points maximum.

Remote Command	<code>[[:SENSe]:CORRection:CSET[1] 2 ... 16:DATA <freq>, <amp1>, ... [:SENSe]:CORRection:CSET[1] 2 ... 16:DATA?</code>
Example	<code>:CORR:CSET1:DATA 10000000,-1.0,20000000,1.0</code> This defines two correction points at (10 MHz, -1.0 dB) and (20 MHz, 1.0 dB) for correction set 1
Preset	Empty after Restore Input/Output Defaults . Survives a shutdown or restart of instrument application (including a power cycle)
State Saved	Saved in instrument state
Min	Freq: 0 Hz Amptd: -1000 dBm
Max	Freq: 1 THz Amptd: +1000 dBm

6.5.16 Correction Group Range Data (Remote Command Only)

Accepts an ASCII series of alternating start frequency, stop frequency and file names, each value separated by commas.

The values sent in the command replace the content of correction group.

The default path for CSV files is:

`D:\My Documents\amplitudeCorrections\`

Remote Command	<code>[[:SENSe]:CORRection:CSET:GRoup[1] 2 ... 10:DATA <startFre- q>,<stopFreq>,<filename1>,<filename2>,...,<filename8></code> See Notes below for explanation of the <filenameN> parameters <code>[[:SENSe]:CORRection:CSET:GRoup[1] 2 ... 10:DATA?</code>
Example	<code>:CORR:CSET:GRO:DATA 10000000,20000000,"myAmpcor.csv"</code>

	"myAmpcor.csv" refers to the Amplitude Correction data from the file myAmpcor.csv in the default path
Notes	<p><filename> is the string containing the path of the correction files</p> <p><filename2>, <filename3>, <filename4>, <filename5>, <filename6>, <filename7>, <filename8> are optional. You can define only <filename1>. The file name defined is added to corresponding File keys based on the sequence sent in the command. File keys with no file name set in the SCPI will be emptied</p> <p>Data for ranges 1 to 10 must be set in ascending order. If you try to set the data for a correction group range that is not connecting to the range currently available, a Data out of range error is generated</p> <p>If the file defined in data is empty, error -250 is reported. If the file does not exist, error -256 is reported. If there is a mismatch of data type, error -250 is reported</p> <p>Only one file with antenna unit can be supported per range. If you try to add another file that contains an antenna unit, a Mass Storage error is generated</p> <p>All ranges have to use a common antenna unit. If you try to add a correction file that contains a different antenna unit, a Mass Storage error is generated</p>
Preset	Reset to Not a Number (9.91e+37) for frequencies and "" for File 1 through File 8 after Restore Input/Output Defaults . Survives a shutdown or restart of instrument application (including a power cycle)
State Saved	Saved in instrument state
Min	Start Freq and Stop Freq: 0 Hz
Max	Start Freq and Stop Freq:1 THz

6.5.17 Delete Correction Group Range (Remote Command Only)

Deletes all range values of corrections Group.

Remote Command	<code>[:SENSe] :CORRection :CSET :GROup :DELeTe</code>
Example	<code>:CORR :CSET :GRO :DEL</code>
Notes	Sending this command when no range is defined in table is accepted without error

6.6 Freq Ref Input

Lets you configure the External Frequency Reference input on the rear panel.

6.6.1 Freq Ref Input

Specifies the frequency reference as being the internal reference, an external reference at the rear panel input labeled EXT REF IN, a 1 pulse per second signal at the EXT REF IN input, or automatically sensing the appropriate reference.

See "[More Information](#)" on page 3108

Remote Command	<code>[:SENSe]:ROSCillator:SOURce:TYPE INTernal EXTernal SENSe PULSe</code> <code>[:SENSe]:ROSCillator:SOURce:TYPE?</code>
Example	<code>:ROSC:SOUR:TYPE SENS</code> <code>:ROSC:SOUR:TYPE INT</code> <code>:ROSC:SOUR:TYPE EXT</code> <code>:ROSC:SOUR:TYPE PULS</code>
Dependencies	The PULSe parameter, and support of the 1 pps signal at the EXT REF IN input, are not available in some model numbers. If not available, the choice does not appear, and sending the PULSe parameter via SCPI generates an error For VXT models SP900B/10A/11A/15A the only available selection is EXTernal , unless SP900B/10A/11A/15A is configured in MIMO mode as Primary module. If configured in MIMO mode as Primary module, the available selection is INTernal EXTernal SENSe For EXM the only available selections are INTernal EXTernal SENSe For E7760B and M8920A the only available selections are INTernal EXTernal This control is not available in UXM
Preset	Unaffected by Preset, but set to EXTernal in VXT models SP900B/10A/11A/15A, INTernal for E7760B, and SENSe for other models, by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state
Annunciation	In the Meas Bar: If you set this to Internal and no external reference is plugged in: Freq Ref: Internal If you set this to Internal and an external reference between 1 and 50 MHz, or a 1 pps signal, IS plugged in: Freq Ref: Internal (in amber, as a warning sign) If you set this to External and an External Reference between 1 and 50 MHz is plugged in: Freq Ref: External If you set this to External and no External Reference is sensed:

	<p>Freq Ref: External (in amber, as a warning sign)</p> <p>When set to Pulse and a 1 pps signal is plugged in: Freq Ref: Pulse</p> <p>If you set this to Pulse and no Pulse Reference is sensed: Freq Ref: Pulse (in amber, as a warning sign)</p> <p>When set to Sense and neither a signal between 1 and 50 MHz nor a 1 pps signal is detected at the EXT REF IN input, "Sense:Int" is displayed: Freq Ref: Sense,Int</p> <p>When set to Sense and a signal within 5 ppm of the External Ref Freq (as set on the Ext Ref Freq control) is detected at the EXT REF IN input: Freq Ref: Sense,Ext</p> <p>When set to Sense and a 1 pps signal is detected at the EXT REF IN input, "Sense:Pulse" is displayed: Freq Ref: Sense,Pls</p>
Status Bits/OPC dependencies	<p>STATus:QUEStionable:FREQuency bit 1 set if unlocked</p> <p>Note: In EXM, the status bit is not set for non-controlling instances. To determine if the frequency reference is unlocked, the controlling instance must be queried</p>
Backwards Compatibility Notes	<p>Freq Ref In was not saved in state in the legacy instruments. It is part of state in the X-Series</p>
Remote Command	<p>[:SENSe] :ROSCillator:SOURce?</p>
Notes	<p>Returns the current switch setting. This means:</p> <ol style="list-style-type: none"> 1. If it was set to SENSe but there is no external reference nor 1pps signal, so the instrument is actually using the internal reference, then this query returns INTernal1, not SENSe 2. If it was set to SENSe and there is an external reference present, the query returns EXTernal1, not SENSe 3. If it was set to SENSe and there is a 1 pps signal present, the query returns PULSe, not SENSe 4. If it was set to EXTernal1, then the query returns EXTernal1 5. If it was set to INTernal1, then the query returns INTernal1 6. If it was set to PULSe, then the query returns PULSe <p>Note: In EXM, the SCPI query always returns INTernal1 for non-controlling instances</p>
Preset	<p>For VXT models SP900B/10A/11A/15A: EXTernal1</p> <p>For E7760B: INTernal1</p> <p>All other models: SENSe</p>
Backwards Compatibility Notes	<p>[:SENSe] :ROSCillator:SOURce? was query-only in ESA which always returned whichever reference the instrument was using. The instrument automatically switched to the ext ref if it was present</p>

	In PSA (which had no sensing), <code>[:SENSe]:ROSCillator:SOURce</code> set the reference (INT or EXT), so again its query returned the actual routing Thus, the query is 100% backwards compatible with both instruments
Notes	For PSA compatibility the command form is provided and is directly mapped to <code>[:SENSe]:ROSCillator:SOURce:TYPE</code> Note: In EXM, the command does nothing for non-controlling instances
Backwards Compatibility SCPI	<code>[:SENSe]:ROSCillator:SOURce INTernal EXTernal</code>

More Information

When the frequency reference is set to internal, the internal 10 MHz reference is used even if an external reference is connected.

When the frequency reference is set to external, the instrument will use the external reference. However, if there is no external signal present, or it is not within the proper amplitude range, a condition error message is generated. When the external signal becomes valid, the error is cleared.

When the frequency reference is set to Pulse, the instrument expects a 1 pulse per second signal at the EXT REF IN input. The instrument uses this signal to adjust the frequency of the internal reference.

If Sense is selected, the instrument checks whether a signal is present at the external reference connector. If it senses a signal within 5 ppm of the External Ref Freq (as set on the **External Ref Freq** control), it will automatically switch to the external reference. If it senses a 1 pulse per second signal, it enters Pulse mode, wherein the signal is used to adjust the internal reference. When no signal is present, it automatically switches to the internal reference. No message is generated as the reference switches between pulse, external and internal. The monitoring of the external reference occurs approximately on 1 millisecond intervals, and never occurs in the middle of a measurement acquisition, only at the end of the measurement (end of the request).

If for any reason the instrument's frequency reference is not able to obtain lock, Status bit 1 in the Questionable Frequency register will be true and a condition error message is generated. When lock is regained, Status bit 1 in the Questionable Frequency register will be cleared and the condition error will be cleared.

If an external frequency reference is being used, you must enter the frequency of the external reference if it is not exactly 10 MHz. The **External Ref Freq** key is provided for this purpose.

For VXT models SP900B/10A/11A/15A, there is no internal frequency reference. To work correctly, a 100MHz external frequency reference signal is needed to connect

to the front panel of the module. The default Freq Ref In setting is “External” and it cannot be set to any other types.

For VXT models SP900B/11A, External Freq Ref Input controls the “100 MHz In” port on the front panel. For VXT models SP900B/16A, External Freq Ref Input controls the “REF In” port on the front panel.

NOTE

In EXM, a common frequency reference module serves all instrument instances, but only one instance of the software application can change the reference input type (INT or EXT or SENSE). The software application allowed to change the reference input is called the primary or controlling instance; by default, the leftmost instrument instance is the controlling instance. This can be changed in the config file “E66XXModules.config” located in the folder E:\Keysight\Instrument. For the non-controlling instance(s) the reference input types (in SCPI commands, and in the Virtual Front Panel menus) are blanked and unavailable for use.

Sense

If **Sense** is selected, the instrument checks whether a signal is present at the external reference connector. If it senses a signal within 5 ppm of the External Ref Freq (as set by **External Ref Freq**), it uses this signal as an External Reference. If it senses a 1 pulse per second signal, it uses this signal to adjust the internal reference by adjusting the User setting of the Timebase DAC. When no signal is present, it automatically switches to the internal reference.

If set to **SENSe** and the instrument senses a 1 pulse per second signal, it sets the **System, Alignments, Timebase DAC** setting to **User**. This setting survives Preset and Power Cycle but is set to **Calibrated** by **System, Restore Defaults, Align** or **System, Restore Defaults, All**

Internal

The internal reference is used. A 1 pps signal at the EXT REF IN port, or a signal there between 1 and 50 MHz, causes a warning triangle to appear in the settings panel next to the word “INTERNAL”, but will otherwise be ignored.

External

The external reference is used.

Pulse

The internal reference continues to be the frequency reference for the instrument in that it determines the reference contribution to the phase noise, but its average frequency is adjusted to follow the 1 pps signal at the EXT REF IN input. Therefore, the instrument frequency accuracy will be dominated by the aging rate of the 1 pps signal instead of the aging rate of the internal reference, except during the time it takes to lock to a new 1 pps signal, approximately 10 minutes.

Sets the System, Alignments, Timebase DAC setting to “User”. This setting survives Preset and Power Cycle, but it set to “Calibrated” on a System, Restore Defaults, Align or a System, Restore Defaults, All

When a 1 pps signal is present at the EXT REF IN input, and either **Pulse** or **Sense** is selected, the internal reference frequency is affected by this signal; in effect, it “learns” a new accuracy setting. This setting can be seen by going to the **System, Alignments, Timebase Dac** menu, and looking at the **User** key in that menu. You will note that User has become automatically selected, and that the value shown on the **User** key is the updated value of the timebase DAC as “learned” from the 1 pps signal. Note that this replaces any value the user might have previously set on this key.

Once the setting is learned the user may remove the 1 pps signal; the User setting for the Timebase DAC is retained until you manually select “Calibrated” or execute a System, Restore Defaults, Align or a System, Restore Defaults, All. If you want to make the User setting permanent there is information in the Service Guide that tells you how to change the Calibrated setting of the Timebase DAC.

Note also that if the 1 pps signal is removed when Sense is selected, the instrument will simply switch to the normal state of the Internal reference and display SENSE:INT in the Settings Panel. However, if the 1 pps signal is removed when Pulse is selected, the instrument will generate an error

The J7203A Atomic Frequency Reference is an accessory for the X-Series Signal Analyzer that provides a highly accurate 1 pps timebase to use in conjunction with the Pulse setting. With the J7203A, the 1 pps signal is guaranteed to meet the input requirements of the EXT REF IN port, and the improved accuracy of the instrument’s internal frequency reference is specified. This is the only 1 pps signal that is guaranteed to function properly with the X-Series.

6.6.2 Ext Ref Freq

This key tells the instrument the frequency of the external reference. When the external reference is in use (either because the reference has been switched to External or because the Reference has been switched to Sense and there is a valid

external reference present) this information is used by the instrument to determine the internal settings needed to lock to that particular external reference signal.

For the instrument to stay locked, the value entered must be within 5 ppm of the actual external reference frequency. So, it is important to get it close, or you risk an unlock condition.

Note that this value only affects the instrument's ability to lock. It does not affect any calculations or measurement results. See "Freq Offset" in the Frequency section for information on how to offset frequency values.

Remote Command	<code>[:SENSe]:ROSCiillator:EXTernal:FREQuency <freq></code> <code>[:SENSe]:ROSCiillator:EXTernal:FREQuency?</code>	
Example	<code>:ROSC:EXT:FREQ 20 MHz</code> sets the external reference frequency to 20 MHz, but does not select the external reference <code>:ROSC:SOUR:TYPE EXT</code> selects the external reference	
Dependencies	Still available with Internal or Pulse selected, to allow setup for when External is in use. However, the setting has no effect if the Internal Reference is in use (Freq Ref In set to Internal, Pulse, or SENSE:INT or SENSE:PULSE) This control is not available in UXM For VXT models SP900B/10A/11A/15A/16A: only 100 MHz is available	
Preset	Unaffected by Mode Preset, Input/Output Preset , or Restore Defaults, Input/Output , but set to 100 MHz for VXT models and 10 MHz for other models, by Restore Defaults, Misc , or Restore Defaults, All , or by pressing Default External Ref Freq	
State Saved	Power On Persistent (survives power cycle)	
Min	CXA, EXA, N897xB, E7760B, M8920A, CXA-m	10 MHz
	VXT models	100 MHz
	All other models	1 MHz
Max	CXA, EXA, N897xB, M8920A, CXA-m	10 MHz
	EXA with option R13	20 MHz
	MXA, PXA, EXM	50 MHz
	VXT models SP900B/10A/11A/15A	100 MHz

6.6.3 Default External Ref Freq

Restores the External Ref Freq to its default of 10 MHz.

When you set an External Ref Freq value with the **Ext Ref Freq** control, that Frequency is persistent; is not affected by Mode Preset or Input/Output Preset, and survives shutdown and power cycle. This control allows you to reset the External Ref Freq to its default value.

NOTE

The persistence of the External Ref Freq is a new behavior as of firmware version A.18.00, necessitating the addition of this control. In versions before A.18.00, the frequency reset on a power cycle/restart. Thus, you may need to use this command to retain backwards compatibility.

Remote Command	<code>[:SENSe]:ROSCillator:EXTernal:FREQuency:DEFault</code>
Example	<code>:ROSC:EXT:FREQ:DEF</code> resets the external ref frequency
Notes	Command only; no query
Dependencies	Grayed-out if the Ext Ref Freq is already set to the default Does not appear in EXM, UXM, VXT models or M8920A

6.6.4 Ref Lock BW

Lets you adjust the Frequency Reference phase lock bandwidth. This control is available in some models of the X-Series.

It is possible to improve the phase noise of the instrument by several dB, even tens of dB, by using an external reference with excellent phase noise. When an external reference is used the instrument's close-in phase noise improves to match that of the reference.

Normally a narrow loop bandwidth is used to phase lock to the external reference. However, the Ref Lock BW control allows you to choose a wider loop bandwidth to reduce the phase noise at low offset frequencies, especially 4 to 400 Hz offset. The Wide setting represents about a 60 Hz loop bandwidth, the Narrow setting about 15 Hz.

When using an external reference with superior phase noise, Keysight recommends setting the external reference phase-locked-loop bandwidth to Wide to take advantage of that superior performance.

When using an external reference with inferior phase noise performance, Keysight recommends setting the bandwidth to Narrow.

In these relationships, inferior and superior phase noise are with respect to -134 dBc/Hz at 30 Hz offset from a 10 MHz reference. Because most reference sources have phase noise behavior that falls off at a rate of 30 dB/decade, this is usually equivalent to -120 dBc/Hz at 10 Hz offset.

In instruments with EP1 or EP2, this control only affects the external reference loop bandwidth. In instruments with EP0, this control also affects the loop bandwidth used when the Internal reference is selected (reference set manually to Internal or Pulse, or set to Sense and set by sensing to Internal or Pulse).

Remote Command	<code>[:SENSe]:ROSCillator:BANDwidth WIDE NARRow</code> <code>[:SENSe]:ROSCillator:BANDwidth?</code>
Example	<code>:ROSC:BAND WIDE</code>
Dependencies	In instruments with EP1 or EP2: the control is available (not grayed-out) even with Internal or Pulse selected, to allow setup for when External is in use. However, the setting has no effect if the Internal Reference is in use Only appears in instruments equipped with the required hardware Does not appear in EXM, UXM, VXT models or E7760B
Preset	Unaffected by Preset, but set to NARRow by Restore Input/Output Defaults or Restore System Defaults -> All
State Saved	Saved in Input/Output state

6.6.5 Reference Oscillator On/Off (Remote Command Only)

Provided for PSA code compatibility.

In PSA it turned the Reference Oscillator on and off, however in the X-Series the reference oscillator cannot be turned off, so no hardware is affected when it is received.

If queried it returns the state you set with the command, but note that this does not necessarily reflect the actual state of the Reference Oscillator, which is always **ON**.

Example	<code>:ROSCillator:OUTP ON</code>
Preset	Unaffected by Preset, but set to ON by Restore Input/Output Defaults or Restore System Defaults -> All
Backwards Compatibility SCPI	<code>[:SENSe]:ROSCillator:OUTPut[:STATe] ON OFF 1 0</code> <code>[:SENSe]:ROSCillator:OUTPut[:STATe]?</code>

6.6.6 PXIe Freq Ref

Modular products like VXT models SP900B/11A requires external reference signal. If there is a PXIe reference module such as M9300A installed in the same chassis as VXT, PXIe Freq Ref allows you to control that reference module.

When you start the first X-Apps, Reference control program will be start at the same time. And it will still run in background after you close the X-Apps. When multiple X-Apps instance are running, you can use any X-Apps instance to control the reference. the status of reference will be updated to all the X-Apps instance.

6 Input/Output

6.6 Freq Ref Input

when there are multiple Reference modules inside a chassis, we suggest you use the SFP of the Reference module to control them separately. Because this control can only set all the Reference modules with the same parameters.

Dependencies	Only available in PXIe modular products which require external reference signal, such as VXT models SP900B/11A/15A
--------------	--

6.6.6.1 Select Ref

Allows you to select the reference model to control.

Because Reference is a standard alone module, we don't save the reference status in a state file.

Remote Command	<code>[:SENSe]:ROSCillator:PXIReference:SElect NONE M9300a</code> <code>[:SENSe]:ROSCillator:PXIReference:SElect?</code>
----------------	---

Example	<code>:ROSC:PXIR:SEL M9300</code> <code>:ROSC:PXIR:SEL?</code>
---------	---

Dependencies	Only Keysight M9300A Frequency Reference is supported now
--------------	---

State Saved	No
-------------	----

6.6.6.2 Freq Ref In

Specifies the frequency reference as being the internal reference, an external reference at the front panel input labeled Ref In.

Remote Command	<code>[:SENSe]:ROSCillator:PXIReference:SOURce INTernal EXTernal</code> <code>[:SENSe]:ROSCillator:PXIReference:SOURce?</code>
----------------	---

Example	<code>:ROSC:PXIR:SOUR INT</code> <code>:ROSC:PXIR:SOUR?</code>
---------	---

Dependencies	Only available when Select Ref is not None
--------------	--

Preset	Internal
--------	----------

State Saved	Saved in instrument state
-------------	---------------------------

6.6.6.3 External Freq Ref

Tells the PXIe Ref module the frequency of the external reference. When the external reference is in use this information is used by the Ref module to determine the internal settings needed to lock to that particular external reference signal.

For the instrument to stay locked, the value entered must be within 5 ppm of the actual external reference frequency. So, it is important to get it close, or you risk an unlock condition.

Remote Command	<code>[:SENSe]:ROSCillator:PXIReference:EXTernal:FREQuency <freq></code> <code>[:SENSe]:ROSCillator:PXIReference:EXTernal:FREQuency?</code>
Example	<code>:ROSC:PXIR:EXT:FREQ 20 MHz</code> sets the external reference frequency to 20 MHz, but does not select the external reference <code>:ROSC:PXIR:SOUR EXT</code> selects the external reference
Dependencies	Only available when Select Ref is not None
Preset	10 MHz
State Saved	Yes
Min	1 MHz
Max	110 MHz

6.6.6.4 Ext Ref Locked (Remote Command Only)

Query the External Reference locked status

Remote Command	<code>[:SENSe]:ROSCillator:PXIReference:EXTernal:LOCK?</code>
Example	<code>:ROSC:PXIR:EXT:LOCK?</code>
Notes	Query only Returns "1" if the Freq Ref Input is External and Reference is locked. Otherwise returns "0" When the Freq Ref Input is External and Reference is unlocked, the following warning message appears in the status bar: <code>Settings Alert; M9300A Ext Ref Unlocked</code>
Dependencies	Only available when Select Ref is not None

6.7 Output

Accesses controls that configure various output settings, like the frequency reference output, IF outputs and analog output.

Not all measurements support all output functions. For example, the Swept SA Measurement does not support the Digital Bus function or the I/Q Cal Out function under the **Output** tab; although the controls display, the outputs do not function in this measurement.

In addition, if the appropriate license is not present, some controls may not appear. In Modes/Measurements that do not support particular controls, the controls may appear, but no output will be generated if they are selected.

This tab does not appear in EXM or VXT model SP900B.

6.7.1 Analog Out

Lets you control which signal is fed to the “Analog Out” connector on the instrument rear panel.

In the Auto state, the Analog Output will automatically be set to the most sensible setting for the current mode or measurement.

If you make a selection manually from the **Analog Out** menu, the manually selected choice will remain in force until you change it (or re-select Auto), even if you switch to a mode or measurement for which the selected output does not apply.

Remote Command	<pre>:OUTPut:ANALog OFF SVIDeo LOGVideo LINVideo DAUDio!For details of options, see More Information below :OUTPut:ANALog? :OUTPut:ANALog:AUTO OFF ON 0 1 :OUTPut:ANALog:AUTO?</pre>
Example	<pre>:OUTP:ANAL SVIDeo</pre> <p>causes the analog output type to be Screen Video</p> <pre>:OUTP:ANAL:AUTO ON</pre>
Preset	Unaffected by Preset, but set to DAUDio by Restore Input/Output Defaults or Restore System Defaults->All ON
State Saved	Saved in Input/Output State
Backwards Compatibility Notes	Prior to A.04.00, OFF was the default functionality except when in the Analog Demod application or with Tune and Listen, in which case it was DAUDio , and there was no selection menu. For backwards compatibility with earlier X-Series firmware versions, Auto (:OUTP:ANAL:AUTO ON) duplicates the prior behavior

The **DNWB** and **SANalyzer** parameters, which were legal in PSA but perform no function in the X-Series, are accepted without error

More Information

The Analog Output options are:

Source	Example	Notes
Off	<code>OUTP:ANAL OFF</code>	The Analog Output is off
Screen Video	<code>OUTP:ANAL SVID</code>	Selects the analog output to be the screen video signal. In this mode, the pre-detector data is output to the Analog Out connector. The output looks very much like the trace displayed on the instrument's screen, and depends on the Log/Lin display Scale, Reference Level, and dB per division, but is not influenced by the selected detector or any digital flatness corrections or trace post-processing (like Trace Averaging)
Log Video	<code>OUTP:ANAL LOGV</code>	Selects the analog output to be the log of the video signal. In this mode, the pre-detector data is output to the Analog Out connector with a Log scaling. The output is referenced to the current level at the mixer, does not depend on display settings like Reference Level or dB per division, and it is not influenced by the selected detector or any digital flatness corrections or trace post-processing (like Trace Averaging), but does change with input attenuation
Linear Video	<code>OUTP:ANAL LINV</code>	Selects the analog output to be the envelope signal on a linear (voltage) scale. In this mode, the pre-detector data is output to the Analog Out connector with a Linear scaling. The output is based on the current Reference Level, and is not influenced by the selected detector or any digital flatness corrections or trace post-processing (like Trace Averaging)
Demod Audio	<code>OUTP:ANAL DAUD</code>	Selects the analog output to be the demodulation of the video signal. When Demod Audio is selected, the demodulated audio signal appears at this output whenever the Analog Demod application is demodulating a signal or when Analog Demod Tune and Listen is operating in the Swept SA measurement When Analog Out is in the Auto state, this output is auto-selected when in the Analog Demod mode or when Analog Demod Tune and Listen is operating in the Swept SA measurement

The table below specifies the range for each output.

6 Input/Output
6.7 Output

Analog Out	Nominal Range exc (10% overrange)	Scale Factor	Notes
Off	0 V		
Screen Video	0 – 1 V open circuit	10%/division	8566 compatible
Log Video	0 – 1 V terminated	1/(192.66 dB/V)	dB referenced to mixer level, 1V out for –10 dBm at the mixer
Linear Video	0 – 1 V terminated	100%/V	Linear referenced to Ref Level, 1 V out for RF envelope at the Ref Level
Demod Audio	(varies with instrument setting)		

Notes about the Analog Outputs

Screen Video

This mode is similar to the Analog Output of the HP 8566 family and the Video Out (opt 124) capability of the Keysight PSA analyzer (E444x), although there are differences in the behavior.

Screen Video output changes while in FFT Sweeps, so for measurements that use exclusively FFT Sweeps, or if the user manually chooses FFT Sweeps, the Screen Video output will look different than it does in swept mode

Because the Screen Video output uses one of the two IF processing channels, only one detector is available while Screen Video is selected. All active traces will change to use the same detector as the selected trace when Screen Video is activated.

Screen Video output is not available while any EMI Detector is selected (Quasi Peak, RMS Average or EMI Average), because these detectors use both IF processing channels. Consequently, if the user chooses an EMI Detector, there will be no Screen Video output.

The output holds at its last value during an alignment and during a marker count. After a sweep:

- If a new sweep is to follow (as in Continuous sweep mode), the output holds at its last value during the retrace before the next sweep starts. If the instrument is in zero-span, there is no retrace, as the instrument remains tuned to the Center Frequency and does not sweep. Therefore, in zero-span, the output simply remains live between display updates
- If no new sweep is to follow (as in Single sweep mode), the output remains live, and continues to show the pre-detector data

This function depends on optional capability; the selection is not available, and the command will generate an “Option not available” error unless you have Option YAV or YAS licensed in your instrument.

The Screen Video function is intended to be very similar to the 8566 Video Output and the PSA Option 124. However, unlike the PSA, it is not always on; it must be switched on by the Screen Video key. Also, unlike the PSA, there are certain dependencies (detailed above) – for example, the Quasi Peak Detector is unavailable when Screen Video is on.

Furthermore, the PSA Option 124 hardware was unipolar, and its large range was padded to be exactly right for use as a Screen Video output. In the X-Series, the hardware is bipolar and has a wider range to accommodate the other output choices. Therefore, the outputs won't match up exactly and users may have to modify their setup when applying the X-Series in a PSA application.

Log Video

Log Video shows the RF Envelope with the Reference equal to the Mixer Level. The output is designed so that full scale (1 V) corresponds to -10 dBm at the mixer. The full range (0-1 V) covers 192.66 dB ; thus, 0 V corresponds to -202.66 dBm at the mixer.

Because the Log Video output uses one of the two IF processing channels, only one detector is available while Screen Video is selected. All active traces will change to use the same detector as the selected trace when Log Video is activated.

Log Video output is not available while any EMI Detector is selected (Quasi Peak, RMS Average or EMI Average), because these detectors use both IF processing channels. Consequently, if the user chooses an EMI Detector, there will be no Log Video output.

The output holds at its last value during an alignment, during a marker count, and during retrace (after a sweep and before the next sweep starts).

This function depends on optional capability. The choice will not appear, and the command will generate an “Option not available” error unless you have Option YAV licensed in your instrument.

Log Video output changes while in FFT Sweeps, so for measurements that use exclusively FFT Sweeps, or if the user manually chooses FFT Sweeps, the Log Video output will look different than it does in swept mode.

Linear Video

Linear Video shows the RF Envelope with the Reference equal to the Ref Level. The scaling is set so that 1 V output occurs with an instantaneous video level equal to the reference level, and 0 V occurs at the bottom of the graticule. This scaling gives you the ability to control the gain without having another setup control for the key.

6 Input/Output

6.7 Output

But it requires you to control the look of the display (the reference level) in order to control the analog output.

This mode is ideal for looking at Amplitude Modulated signals, as the linear envelope effectively demodulates the signal.

Because the Linear Video output uses one of the two IF processing channels, only one detector is available while Linear Video is selected. All active traces will change to use the same detector as the selected trace when Log Video is activated.

Linear Video output is not available while any EMI Detector is selected (Quasi Peak, RMS Average or EMI Average), because these detectors use both IF processing channels. Consequently, if the user chooses an EMI Detector, there will be no Linear Video output.

The output holds at its last value during an alignment and during a marker count and during retrace (after a sweep and before the next sweep starts).

This function depends on optional capability; the choice will not appear, and the command will generate an “Option not available” error unless you have Option YAV licensed in your instrument. Linear Video output changes while in FFT Sweeps, so for measurements that use exclusively FFT Sweeps, or if the user manually chooses FFT Sweeps, the Linear Video output will look different than it does in swept mode.

Demod Audio

When Analog Out is in the Auto state, this output is auto-selected when in the Analog Demod mode or when **Analog Demod Tune and Listen** is operating in the Swept SA measurement.

If any other Analog Output is manually selected when in the Analog Demod mode or when **Analog Demod Tune and Listen** is operating in the Swept SA measurement, a condition warning message appears. This choice only appears if the Analog Demod application (N9063A), the N6141A or W6141A application, or Option EMC is installed and licensed, otherwise the choice will not appear, and the command will generate an “Option not available” error.

The output holds at its last value during an alignment and during a marker count. It is not held between sweeps, in order for Tune and Listen to work properly.

When Demod Audio is the selected Analog Output, all active traces are forced to use the same detector, and the CISPR detectors (QPD, EMI Avg, RMS Avg) are unavailable

6.7.2 Screen Video Level

Lets you control the amplitude of the Analog Output when Screen Video is selected.

- The 1V (**NORMal**) setting provides a nominal output of 1V peak-to-peak into an open circuit. This matches the traditional behavior of X-series instruments
- The 2V (**COMPatible**) setting provides a nominal output of 2V peak-to-peak into an open circuit. This matches the legacy behavior of PSA and earlier analyzers

Remote Command	<code>:OUTPut:ANALog:SVIDeo NORMal COMPatible</code> <code>:OUTPut:ANALog:SVIDeo?</code>
Example	<code>:OUTP:ANAL:SVID COMP</code> causes the Screen Video level to be 2V
Dependencies	Only appears if Screen Video is the selected Analog Output
Preset	Unaffected by Preset, but set to NORM by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in Input/Output State

6.7.3 Digital Bus Out

Turns on the LVDS Digital Output port for outputting digital acquisition data.

- When Bus Out is **ON**, all acquisitions are streamed to the output port including acquisitions for internal purposes such as Alignment. The internal processing and routing of acquisitions continues as usual and is unaffected by the state of Bus Out
- When Bus Out is **OFF**, no signal appears on the LVDS port

Remote Command	<code>:OUTPut:DBUS[1][:STATe] ON OFF 1 0</code> <code>:OUTPut:DBUS[1][:STATe]?</code>
Example	<code>:OUTP:DBUS ON</code>
Dependencies	Requires option RTL or control is not displayed Digital Bus and Wideband Digital Bus cannot be on at the same time, so: <ul style="list-style-type: none"> – When Wideband Bus is turned ON, if Digital Bus is already ON, an advisory message is displayed, “Wideband Digital Bus On, Digital Bus (narrow band) forced to Off” – When Digital Bus is turned ON, if Wideband Digital Bus is already ON, an advisory message is displayed, “Digital Bus (narrow band) On, Wideband Digital Bus forced to Off”
Preset	OFF (set by Restore Input/Output Defaults)
State Saved	Saved in Input/Output State

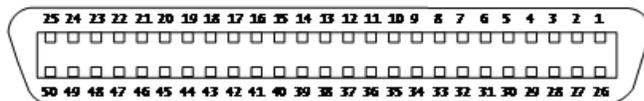

6.7.4 Wideband Digital Bus

Turns on the LVDS port on the Wideband IF, which causes the I/Q pairs from the current measurement to be sent to this port. The control is grayed-out unless in the RTSA Mode, which has the only measurement that supports wideband streaming.

- When Wideband Digital Bus is **ON**, the internal processing and routing of acquisitions continues as usual, and the display of measurement data is unaffected
- When Wideband Digital Bus is **OFF**, no signal appears on the LVDS port

Remote Command	<code>:OUTPut:DBUS2[:STATe] OFF ON 0 1</code> <code>:OUTPut:DBUS2[:STATe]?</code>
Example	<code>:OUTP:DBUS2 ON</code>
Notes	If this command is sent while running a measurement that does not support Wideband Digital Bus, the message “Settings conflict; Feature not supported for this measurement” is displayed
Dependencies	Requires option RTS or control is not displayed Digital Bus and Wideband Digital Bus cannot be on at the same time, so: <ul style="list-style-type: none"> – When Wideband Bus is turned ON, if Digital Bus is already ON, an advisory message is displayed, “Wideband Digital Bus On, Digital Bus (narrow band) forced to Off” – When Digital Bus is turned ON, if Wideband Digital Bus is already ON, an advisory message is displayed, “Digital Bus (narrow band) On, Wideband Digital Bus forced to Off”
Preset	OFF (set by Restore Input/Output Defaults)
State Saved	Saved in Input/Output State

Here is the Wideband LVDS connector as viewed from the rear panel. The pin assignments are listed below:

I-Cable

Stream_VALID	Data valid, when '1' then I/Q data is valid	
Stream_CLK	150 MHz DDR clock	
Stream_MARK_1	Stream Mark Bit 1	
Stream_MARK_2	Stream Mark Bit 2	
Stream_ALT	currently unused	

6.7.5 Data Stream

Lets you choose data or a test pattern to output to the Wideband IF LVDS port. This can help you set up your streaming target devices.

Remote Command	<code>:OUTPut:DBUS2:DATA MEASure TEST</code> <code>:OUTPut:DBUS2:DATA?</code>
Example	<code>:OUTP:DBUS2:DATA TEST</code>
Notes	Selecting TEST routes a test pattern to the Wideband Digital Bus stream output
Preset	MEAS (set by Restore Input/Output Defaults)
State Saved	Saved in Input/Output State

6.7.6 I/Q Cal Out

The Baseband I/Q "Cal Out" port can be turned on with either a 1 kHz or a 250 kHz square wave. This can be turned on independent of the input selection. Preset resets this to **OFF**.

Remote Command	<code>:OUTPut:IQ:OUTPut IQ1 IQ250 OFF</code> <code>:OUTPut:IQ:OUTPut?</code>
Example	<code>:OUTP:IQ:OUTP IQ1</code>
Dependencies	Only available with Option BBA
Couplings	An I/Q Cable Calibration or an I/Q Probe Calibration will change the state of the Cal Out port as needed by the calibration routine. When the calibration is finished the I/Q Cal Out is restored to the pre-calibration state
Preset	OFF
State Saved	Saved in instrument state
Range	1 kHz Square Wave 250 kHz Square Wave Off

6.7.7 Aux IF Out

Controls the signals that appear on the SMA output on the rear panel labeled “AUX IF OUT”

NOTE

Aux IF Out is valid for the RF Input and for the External Mixer input. In external mixing, the Aux IF output level is set by factory default to accommodate expected IF levels for the RF path. When using the External Mixing path, the Aux IF Out levels (for all three options CR3, CRP and ALV) will therefore be uncalibrated.

Remote Command	<code>:OUTPut:AUX SIF AIF LOGVideo OFF</code> For details of the options, see "More Information" on page 3125 and "Notes on the Aux IF Outputs" on page 3126 below <code>:OUTPut:AUX?</code>
Dependencies	Does not appear in models that do not support the Aux IF Out
Preset	Unaffected by Preset, but set to OFF by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in Input/Output state
Backwards Compatibility Notes	In the PSA, the IF output has functionality equivalent to the "Second IF" function in the X-Series' Aux IF Out menu. In the X-Series, it is necessary to switch the Aux IF Out to "Second IF" to get this functionality, whereas in PSA it is always on, since there are no other choices. Hence a command to switch this function to "Second IF" will have to be added by customers migrating from PSA who use the IF Output in PSA

More Information

The Aux IF Output options are:

Source	Example	Notes
Off	<code>OUTP:AUX</code>	In this mode nothing comes out of the “AUX IF OUT” connector

6 Input/Output
6.7 Output

Source	Example	Notes
	OFF	on the rear panel. The connector appears as an open-circuit (that is, it is not terminated in any way)
Second IF	OUTP : AUX SIF	In this mode the 2 nd IF output is routed to the rear panel connector. Annotation on the menu panel shows the current 2 nd IF frequency in use in the instrument
Arbitrary IF	OUTP : AUX AIF	In this mode the 2 nd IF output is mixed with a local oscillator and mixer to produce an arbitrary IF output between 10 MHz and 75 MHz with 500 kHz resolution. The phase noise in this mode will not be as good as in Second IF mode The IF output frequency is adjustable, through an active function which appears on the menu panel, from 10 MHz to 75 MHz with 500 kHz resolution Note that, in instruments with Options B2X or B5X, the Arbitrary IF Output is only practical when the IF Bandwidth is <= 40 MHz, IF Path is <= 40 MHz, or FFT Width is <= 40 MHz
Fast Log Video	OUTP : AUX LOGV	In this mode the 2 nd IF output is passed through a log amp and the log envelope of the IF signal is sent to the rear panel. The open circuit output level varies by about 25 mV per dB, with a top-of-screen signal producing about 1.6 Volts. The output impedance is nominally 50 ohms This mode is intended to meet the same needs as Option E4440A-H7L Fast Rise Time Video Output on the Keysight E4440A PSA Series, allowing you to characterize pulses with fast rise times using standard measurement suites on modern digital scopes

Notes on the Aux IF Outputs

Second IF

The frequency of the 2nd IF depends on the current IF signal path as shown in the table below:

IF Path Selected	Frequency of "Second IF" Output
10 MHz	322.5 MHz
25 MHz	322.5 MHz
40 MHz	250 MHz
85-160 MHz	300 MHz
255 MHz	750 MHz
510 MHz	877.1484375 MHz

The signal quality, such as signal to noise ratio and phase noise, are excellent in this mode.

The Second IF choice does not appear unless Option CR3 is installed.

Arbitrary IF

The bandwidth of this IF output varies with band and center frequency, but is about 40 MHz at the -3 dB width. When the output is centered at lower frequencies in its range, signal frequencies at the bottom of the bandwidth will “fold”. For example, with a 40 MHz bandwidth (20 MHz half-bandwidth), and a 15 MHz IF center, a signal -20 MHz relative to the spectrum analyzer center frequency will have a relative response of about -3 dB with a frequency 20 MHz below the 15 MHz IF center. This -5 MHz frequency will fold to become a +5 MHz signal at the IF output. Therefore, lower IF output frequencies are only useful with known band-limited signals.

The Arbitrary IF choice does not appear unless Option CRP is installed.

Fast Log Video

The output is off during an alignment but not during a marker count, and is not blanked during retrace (after a sweep and before the next sweep starts).

The Fast Log Video choice does not appear unless Option ALV is installed.

6.7.8 Arbitrary IF Freq

Sets the frequency of the Arbitrary IF when Aux IF Out is set to Arbitrary IF.

NOTE

In instruments with Options B2X or B5X, the Arbitrary IF Output is only practical when the IF Bandwidth is ≤ 40 MHz, IF Path is ≤ 40 MHz, or FFT Width is ≤ 40 MHz.

Remote Command	<code>:OUTPut:AUX:AIF <value></code> <code>:OUTPut:AUX:AIF?</code>
Example	<code>:OUTP:AUX:AIF 50 MHz</code>
Dependencies	Only appears if Arbitrary IF is the selected Aux IF Output
Preset	Unaffected by a Preset, but set to 70 MHz by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in Input/Output State
Min	10 MHz
Max	75 MHz

6.7.9 Ext/Wide IF Out

Causes the signal that is normally routed to the IF to be routed instead to the Ext IF Out connector on the rear panel (SP900S) or Wide IF Out connector on the front panel (SP900S) or rear panel (SP900P). This is available in SP900S when RF Input 2

6 Input/Output
6.7 Output

is the selected input port and in SP900P/SP900S on RF Input and, when V3050A is attached, External RF Input.

Only one IF output (Ext/Wide IF Out, IF2 Out, or Aux IF Out) can be selected at a time, so switching Ext/Wide IF Out to On changes IF2 Out and Aux IF Out to Off, and setting Aux IF Out to something other than Off or IF2 Out to On forces Ext/Wide IF Out to Off.

Remote Command	<code>:OUTPut:EIF ON OFF 1 0</code> <code>:OUTPut:EIF?</code>
Example	<code>:OUTP:EIF ON</code>
Dependencies	Only appears in SP900S, SP900P, and SP900S For SP900S, enabled when RF Input 2 is the selected input. When RF Input 2 is not selected, the control is grayed out and forced to Off and attempting to set it On will result in an error message For SP900P/SP900S, enabled on RF Input and on External RF Input when V3050A is attached When this switch is ON , no measurement is displayed, and the error “No result; meas invalid with Ext/Wide IF Out set to On” appears in the Status bar
Preset	Off (not affected by Mode Preset, but set to OFF by Input/Output Preset)
State Saved	Saved in Input/Output state
Annotation	None (but error message appears when on)
Status Bits/OPC dependencies	STATus:QUEStionable:INTEgrity bit 1 is set when Ext/Wide IF Out is On. This shows as an error because no valid data is on the screen or available via SCPI. However, the signal out the Ext/Wide IF Out port is still valid given the other settings

6.7.10 IF2 Out

The **IF2 Out** switch causes the signal which is normally routed to the IF, when the 1 GHz IF Path is selected, to be routed instead to the IF2 Out connector on the rear panel.

Only one IF output (Ext IF Out, IF2 Out, or Aux IF Out) can be selected at a time, so switching IF2 Out to On will change Ext IF Out and Aux IF Out to Off, and setting Aux IF Out to something other than Off or Ext IF Out to On will force IF2 Out to Off.

This control only appears if Option H1G is installed. It is only available when the 1 GHz IF Path is chosen, either directly or indirectly; in all other paths it is visible but grayed out and forced to Off. Attempting to set it On when the 1GHz path is not selected will result in an error.

- Direct selection of the 1 GHz path: Measurements that directly support the 1 GHz path have a 1 GHz selection in the IF Path menu in Meas Setup
- Indirect selection of the 1 GHz path: certain measurements, like CCDF, always choose the widest available path, and so will choose the 1 GHz path if it is available, even if there is no IF Path menu in the measurement. IF2 Out will be

visible when this results in the 1 GHz path being selected, even if there is no control or readout indicating that the 1 GHz path is chosen

Remote Command	<code>:OUTPut:IF2 ON OFF 1 0</code> <code>:OUTPut:IF2?</code>
Example	<code>:OUTP:IF2 ON</code>
Dependencies	Only appears in UXA and only when HIG is installed When this switch is ON , no measurement is displayed, and the error “No result; meas invalid with IF2 Out set to On” appears in the Status bar
Preset	OFF (not affected by Mode Preset but set to OFF by Input/Output Preset)
State Saved	Saved in Input/Output state
Annotation	None (but error message appears when on)
Status Bits/OPC dependencies	STATus:QUEStionable:INTEgrity bit 1 is set when IF2 Out is ON . This shows as an error because no valid data is on the screen or available via SCPI. However, the signal out the IF2 Out port is still valid given the other settings

6.8 Trigger Output

Accesses controls that configure the **Trigger Output** settings.

6.8.1 Trig 1 Out

Selects the type of output signal that will be output from the Trig 1 Out connector. It is the signal marked **Trigger 1** on the front panel of standalone instruments, and **Trigger 4** on the front panel of VXT model SP900B.

Although the **Trig 1 Out** control applies only to the Trig 1 output, the SCPI command (detailed in the table below) can be used for *any* of the Trig Out connectors, by using the appropriate TRIGGER parameter (for example **TRIG1**, **TRIG2**, etc.).

For full details of each option, see "[More Information](#)" on page 3131

NOTE	Option TARMed is <i>not</i> available in modular instruments.
Remote Command	<code>:TRIGger[1] 2 ... 4[:SEquence]:OUTPut HSWP MEASuring MAIN GATE GTRigger OEVEN TARMed SPOint SSweep SSETtled S1Marker S2Marker S3Marker S4Marker PARB FSYnc OFF</code> <code>:TRIGger[1] 2 ... 4[:SEquence]:OUTPut?</code>
Example	<code>:TRIG:OUTP HSWP</code> <code>:TRIG2:OUTP GATE</code>
Dependencies	You can only send TRIGn parameters for the hardware you have; for example, you cannot send a TRIG3 parameter if your hardware does not support TRIG3 . Sending the command for an output you do not have generates an error, "Hardware missing; Not available for this model number" Querying a nonexistent output returns OFF For VXT models SP900B/11A/15A/16A: <ul style="list-style-type: none"> - When the Trig Out Device is ANALyzer, only MEASuring, MAIN and OFF are available - When the Trig Out Device is SOURce, only S1Marker, S2Marker, S3Marker, S4Marker, PARB, FSYnc and OFF are available For VXT model SP900B,
Preset	Trigger 1: Sweeping (HSWP) Trigger 2: Gate Trigger 3: Sweeping (HSWP) (on models that support Trigger 3) Trigger 4: Gate (on models that support Trigger 4) Unaffected by Preset, but is preset to the above values by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state

More Information

Here are details of all Trigger Output options:

Source	Example	Notes
Off	<code>TRIG1:OUTP OFF</code> <code>TRIG2:OUTP OFF</code>	Selects no signal to be output to the Trig 1 or Trig 2 Out connector
Sweeping (HSWP)	<code>TRIG1:OUTP HSWP</code>	Selects the Sweeping Trigger signal to be output to the Trig 1 Out connector when a measurement is made. This signal has historically been known as "HSWP" (High = Sweeping), and is 5 V TTL level with 50 ohm output impedance
Measuring	<code>TRIG1:OUTP MEAS</code>	Selects the Measuring trigger signal to be output to the Trig 1 Out connector. This signal is true while the Measuring status bit is true
Main Trigger	<code>TRIG1:OUTP MAIN</code>	Selects the current instrument trigger signal to be output to the Trig 1 Out connector
Gate Trigger	<code>TRIG1:OUTP GTR</code>	Selects the gate trigger signal to be output to the Trig 1 Out connector. This is the source of the gate timing, not the actual gate signal
Gate	<code>TRIG1:OUTP GATE</code>	Selects the gate signal to be output to the Trig 1 Out connector. The gate signal has been delayed and its length determined by delay and length settings. When the polarity is positive, a high on the Trig Out connector represents the time the gate is configured to pass the signal
Odd/Even Trace Point	<code>TRIG1:OUTP OEV</code>	Selects either the odd or even trace points as the signal to be output to the Trig 1 Out connector when performing swept spectrum analysis. When the polarity is positive, this output goes high during the time the instrument is sweeping past the first point (Point 0) and every other following trace point. The opposite is true if the polarity is negative
Trigger Armed	<code>TRIG1:OUTP TARM</code>	Selects the "trigger armed" trigger signal to be output to the Trig 1 Out connector. This signal is true when the instrument reaches its trigger armed state <i>Not available in modular instruments</i>
Source Point Trigger	<code>TRIG1:OUTP SPO</code>	Selects the gate signal to be output to the Trig 1 Out connector for use as the Point Trigger when operating an external source in Tracking mode. When Ext Trigger 1 is selected as the Point Trigger under Source, the Source Point Trigger under Trig1 Out automatically gets selected. A similar pattern is

6 Input/Output
6.8 Trigger Output

Source	Example	Notes
		used for the other Ext Trigger inputs; for example, when Ext Trigger 2 is selected as the Point Trigger under Source, the Source Point Trigger under Trig 2 Out automatically gets selected
Source Marker 1	<code>TRIG2:OUTP S1M</code>	Selects the Trigger Output at Marker 1 in the Waveform file which is currently playing. Only available in VXT: for SP900B only for Trigger Output 2, for SP900B/11A/15A/16A available for both Trigger Output 1/2
Source Marker 2	<code>TRIG2:OUTP S2M</code>	Selects the Trigger Output at Marker 2 in the Waveform file which is currently playing. Only available in VXT: for SP900B only for Trigger Output 2, for SP900B/11A/15A/16A available for both Trigger Output 1/2
Source Marker 3	<code>TRIG2:OUTP S3M</code>	Selects the Trigger Output at Marker 3 in the Waveform file which is currently playing. Only available in VXT: for SP900B only for Trigger Output 2, for SP900B/11A/15A/16A available for both Trigger Output 1/2
Source Marker 4	<code>TRIG2:OUTP S4M</code>	Selects the Trigger Output at Marker 4 in the Waveform file which is currently playing. Only available in VXT: for SP900B only for Trigger Output 2, for SP900B/11A/15A/16A available for both Trigger Output 1/2
PerArb	<code>TRIG2:OUTP PARB</code>	Selects the Trigger Output as PerArb. PerArb is a synchronization trigger which is generated by the ARB at the beginning of each repetition of playing the signal. Only available in VXT Models SP900B/11A/15A/16A
FSYNc	<code>:TRIG:FRAM:SYNC EXT1 TRIG2:OUTP FSYNc</code>	Selects the Trigger Output as FSYNc. The FSYNc parameter means route the Periodic Timer Sync Source signal to the specified Trigger output. That is, the signal selected with the <code>:TRIGger[:SEQuence]:FRAMe:SYNC EXTernal1 EXTernal2 RFBurst PXI OFF</code> command will be routed to the specified trigger output The example code means that the External 1 trigger will be used as the Periodic Timer Sync Source, and this signal will then be routed to the Trigger 2 output Only available in VXT Models SP900B/11A/15A/16A
–		

6.8.2 Trig 1 Out Polarity

Sets the output to the Trig 1 Out connector to trigger on either the positive or negative polarity.

Although the **Trig 1 Polarity** control applies only to the Trig 1 output, the SCPI command (detailed in the table below) can be used for *any* of the Trig Out connectors, by using the appropriate **TRIGGER** parameter (for example **TRIG1**, **TRIG2**, etc.).

Remote Command	<code>:TRIGger[1] 2 ... 4[:SEquence]:OUTPut:POLarity POSitive NEGative</code> <code>:TRIGger[1] 2 ... 4[:SEquence]:OUTPut:POLarity?</code>
Example	<code>:TRIG1:OUTP:POL POS</code>
Dependencies	You can only send TRIG parameters for the hardware you have; for example, you cannot send a TRIG3 parameter if your hardware does not support TRIG3 . Sending the SCPI command for an output you do not have generates an error, “Hardware missing; Not available for this model number” Querying a non-existent output returns OFF
Preset	Unaffected by Preset, but set to POSitive by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state

6.8.3 Trig 1 Out Device

Sets the output to the Trig 1 Out connector to trigger on either **ANALyzer** or **SOURce**.

Although the **Trig 1 Out Device** control applies only to the Trig 1 output, the SCPI command (detailed in the table below) can be used for *any* of the Trig Out connectors, by using the appropriate **TRIGGER** parameter (for example, **TRIG1**, **TRIG2**, etc.).

Remote Command	<code>:TRIGger[1] 2 ... 4[:SEquence]:OUTPut:DIRection ANALyzer SOURce</code> <code>:TRIGger[1] 2 ... 4[:SEquence]:OUTPut:DIRection?</code>
Example	<code>:TRIG1:OUTP:DIR ANAL</code>
Dependencies	Only available on VXT models SP900B/11A/15A/16A
Preset	Unaffected by Preset, but set to ANALyzer by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state

6.8.4 Trig 2 Out

Selects the type of output signal that will be output from the Trig 2 Out connector. It is the trigger signal marked **Trigger 2** on the front panel of standalone instruments.

Although the **Trig 2 Out** control applies only to the Trig 2 output, the SCPI command (detailed in the table under "[Trig 1 Out](#)" on page 3130) can be used for *any* of the Trig Out connectors by using the appropriate TRIGGER parameter (e.g., [TRIG1](#), [TRIG2](#), etc.).

Example	<code>:TRIG2:OUTP HSWP</code> <code>:TRIG2:OUTP GATE</code>
Notes	Trig 2 Out is used as the source trigger out in EXM and VXT model SP900B The available choices in EXM and VXT model SP900B are S1Marker , S2Marker , S3Marker , S4Marker and OFF
Dependencies	The second Trigger output (Trig 2 Out) does not appear in all models; in models that do not support it, the Trig 2 Out control is blanked, and sending the SCPI command for this output generates an error, "Hardware missing; Not available for this model number" In models that do not support the Trigger 2 output, this error is returned if trying to set Trig 2 Out and a query of Trig 2 Out returns OFF Power Amplifier app: Trig 2 Output will be set to Source Marker2 when Burst Shape & Mask is set to On, in that case Trig 2 is used to output PA Enable Mask

6.8.5 Trig 2 Out Polarity

Sets the output to the Trig 2 Out connector to trigger on either the positive or negative polarity.

Although the **Trig 2 Out Polarity** control applies only to the Trig 2 output, the SCPI command (detailed in the table under "[Trig 1 Out Polarity](#)" on page 3133) can be used for *any* of the Trig Out connectors by using the appropriate TRIGGER parameter (for example [TRIG1](#), [TRIG2](#), etc.).

Example	<code>:TRIG2:OUTP:POL POS</code>
Dependencies	Does not appear in EXM or VXT
Preset	Unaffected by Preset, but set to POSitive by Restore Input/Output Defaults or Restore System Defaults->All

6.8.6 Trig 2 Out Device

Sets the output to the Trig 2 Out connector to trigger on either the Analyzer or Source.

Although the **Trig 2 Out Device** control applies only to the Trig 2 output, the SCPI command (detailed in the table under "[Trig 2 Out Device](#)" on page 3134) can be used for any of the Trig Out connectors by using the appropriate **TRIGGER** parameter (for example **TRIG1**, **TRIG2**, etc.).

Example	<code>:TRIG2:OUTP:DIR SOUR</code>
Dependencies	Only available on VXT models SP900B/11A/15A/16A
Preset	Unaffected by Preset, but set to Source by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state

6.8.7 Src PXI Trig Out

Selects which signal will be routed to the backplane Source PXI Trigger Output Line.

See "[More Information](#)" on page 3135

Remote Command	<code>:TRIGger:PXIE:SOURce[:SEQuence]:OUTPut S1Marker S2Marker S3Marker S4Marker PARB OFF</code> <code>:TRIGger:PXIE:SOURce[:SEQuence]:OUTPut?</code>
Example	<code>:TRIG:PXIE:SOUR:OUTP S1M</code> <code>:TRIG:PXIE:SOUR:OUTP?</code>
Dependencies	Only appears in EXM and VXT
Preset	OFF
State Saved	Saved in instrument state

More Information

Here are details of all Source PXI Trigger Output options:

Source	Example	Notes
Off	<code>TRIG:PXIE:SOUR:OUTP OFF</code>	Selects no signal to be output to the Source PXI backplane line
Source Marker 1	<code>TRIG:PXIE:SOUR:OUTP S1M</code>	Selects the Trigger Output at Marker 1 in the Waveform file that is currently playing to be output to the Source PXI backplane line
Source Marker 2	<code>TRIG:PXIE:SOUR:OUTP S2M</code>	Selects the Trigger Output at Marker 2 in the Waveform file that is currently playing to be output to the Source PXI backplane line
Source Marker 3	<code>TRIG:PXIE:SOUR:OUTP S3M</code>	Selects the Trigger Output at Marker 3 in the Waveform file that is currently playing to be output to the Source PXI backplane line

6 Input/Output
6.8 Trigger Output

Source	Example	Notes
Source Marker 4	<code>TRIG:PXIE:SOUR:OUTP S4M</code>	Selects the Trigger Output at Marker 4 in the Waveform file that is currently playing to be output to the Source PXI backplane line
PerArb	<code>TRIG:PXIE:SOUR:OUTP PARB</code>	A synchronization trigger that is generated by the ARB at the beginning of each repetition of playing the signal. This selection causes the PerArb Trigger Output that is currently playing to be output to the Source PXI backplane line Only available in VXT Models SP900B/11A/15A/16A

6.8.8 Src Trig Out Polarity

Sets the output to the Source PXI backplane trigger line to trigger on either the positive or negative polarity.

Remote Command	<code>:TRIGger:PXIE:SOURce[:SEQuence]:OUTPut:POLarity POSitive NEGative :TRIGger:PXIE:SOURce[:SEQuence]:OUTPut:POLarity?</code>
Example	<code>:TRIG:PXIE:SOUR:OUTP:POL POS</code>
Dependencies	Only appears in EXM and VXT
Preset	Unaffected by Preset, but set to POSitive by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state

6.8.9 Select Src PXI Line

Controls which backplane trigger line `TRIG[0..7]` is used for the Source Trigger Output.

Remote Command	<code>:TRIGger:PXIE:SOURce[:SEQuence]:OUTPut:LINE <line> :TRIGger:PXIE:SOURce[:SEQuence]:OUTPut:LINE?</code>
Example	<code>:TRIGger:PXIE:SOURce:OUTPut:LINE 0</code>
Dependencies	Only appears in EXM and VXT
Preset	4
State Saved	Saved in instrument state
Range	[0,7]

6.8.10 Analyzer PXI Trig Out

Selects the signal that will be output from Analyzer PXI Trigger Line (Backplane Trigger Line 0~3).

See ["More Information" on page 3137](#)

Remote Command	<code>:TRIGger:PXIE:ANALyzer[:SEQuence]:OUTPut HSWP MEASuring MAIN GATE GTRigger OEVen OFF</code> <code>:TRIGger:PXIE:ANALyzer[:SEQuence]:OUTPut?</code>
Example	<code>:TRIG:PXIE:ANAL:OUTP HSWP</code>
Dependencies	Only available on certain modular analyzers, such as CXA-m and VXT models SP900B/11A/15A/16A For VXT models SP900B/11A/15A/16A, only OFF , MEASuring and MAIN are available
Preset	Unaffected by Preset but is preset to OFF by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state

More Information

Here are details of all Analyzer PXI Trigger Output options:

Source	Example	Notes
Off	<code>TRIG:PXIE:ANAL:OUTP OFF</code> <code>TRIG:PXIE:ANAL:OUTP OFF</code>	Selects no signal to be output to the Analyzer PXI backplane trigger line
Sweeping (HSWP)	<code>TRIG:PXIE:ANAL:OUTP HSWP</code>	Selects the Sweeping Trigger signal to be output to the Analyzer PXI backplane trigger line when a measurement is made. This signal has historically been known as "HSWP" (High = Sweeping), and is 5 V TTL level with 50 ohm output impedance
Measuring	<code>TRIG:PXIE:ANAL:OUTP MEAS</code>	Selects the Measuring trigger signal to be output to the Analyzer PXI backplane trigger line. This signal is true while the Measuring status bit is true
Main Trigger	<code>TRIG:PXIE:ANAL:OUTP MAIN</code>	Selects the current instrument trigger signal to be output to the Analyzer PXI backplane trigger line
Gate Trigger	<code>TRIG:PXIE:ANAL:OUTP GTR</code>	Selects the gate trigger signal to be output to the Analyzer PXI backplane trigger line. This is the source of the gate timing, not the actual gate signal

Source	Example	Notes
Gate	<code>TRIG:PXIE:ANAL:OUTP GATE</code>	Selects the gate signal to be output to the Analyzer PXI backplane trigger line. The gate signal has been delayed and its length determined by delay and length settings. When the polarity is positive, a high on the Trig Out connector represents the time the gate is configured to pass the signal
Odd/Even Trace Point	<code>TRIG:PXIE:ANAL:OUTP OEV</code>	Selects either the odd or even trace points as the signal to be output to the Analyzer PXI backplane trigger line when performing swept spectrum analysis. When the polarity is positive, this output goes high during the time the instrument is sweeping past the first point (Point 0) and every other following trace point. The opposite is true if the polarity is negative

6.8.11 Analyzer Trig Out Polarity

Sets the output to the Analyzer PXI backplane trigger line to trigger on either the positive or negative polarity.

Remote Command	<code>:TRIGger:PXIE:ANALyzer[:SEQuence]:OUTPut:POLarity POSitive NEGative :TRIGger:PXIE:ANALyzer[:SEQuence]:OUTPut:POLarity?</code>
Example	<code>:TRIG:PXIE:ANAL:OUTP:POL POS</code>
Dependencies	Only available on certain modular analyzers, such as CXA-m and VXT models SP900B/11A/15A/16A
Preset	Unaffected by Preset, but set to POSitive by Restore Input/Output Defaults or Restore System Defaults->All POSitive
State Saved	Saved in instrument state

6.8.12 Select Analyzer PXI Line

Controls which `PXI_TRIG[0...3]` is used for the Analyzer Trigger Output.

Remote Command	<code>:TRIGger:PXIE:ANALyzer[:SEQuence]:OUTPut:LINE <line> :TRIGger:PXIE:ANALyzer[:SEQuence]:OUTPut:LINE?</code>
Example	<code>:TRIGger:PXIE:ANALyzer:OUTPut:LINE 0</code>
Dependencies	Only available on certain modular analyzers, such as CXA-m and VXT models SP900B/11A/15A/16A
Preset	0
State Saved	Saved in instrument state
Range	[0,3]

6.8.13 Source Internal Trig Out

Selects the signal which will be output from Source Internal Trigger Line.

NOTE

In some software released in 2018 and 2019, the SCPI command for this function was as below:

```
:TRIGger:SOURce:INTernal[:SEquence]:OUTPut
S1Marker|S2Marker|S3Marker|S4Marker|OFF
```

It was necessary to change this SCPI in release A.24.00 due to internal conflicts in the software. User code written for the A.22.xx or A.23.xx instrument software which used the old form must be rewritten to use the form below.

Remote Command	<code>:TRIGger[:SEquence]:INTernal:SOURce:OUTPut S1Marker S2Marker S3Marker S4Marker PARB OFF</code> <code>:TRIGger[:SEquence]:INTernal:SOURce:OUTPut?</code>
Example	<code>:TRIG:INT:SOUR:OUTP S1M</code>
Notes	PARB (Per ARB) –A synchronization trigger that is generated by the ARB at the beginning of each repetition of playing the signal
Dependencies	Only available on VXT models SP900B, SP900B/11A/15A/16A
Preset	Unaffected by Preset, but preset by Restore Input/Output Defaults or Restore System Defaults->All . The value is Mode-dependent: Power Amplifier Mode: S1Marker All other Modes: OFF
State Saved	Saved in instrument state

6.8.14 Source Internal Trig Out Polarity

Sets the output to the Source Internal trigger line to trigger on either the positive or negative polarity.

NOTE

In some software released in 2018 and 2019, the SCPI command for this function was as below:

```
:TRIGger:SOURce:INTernal[:SEquence]:OUTPut:POLarity
POSitive|NEGative
```

It was necessary to change this SCPI in release A.24.00 due to internal conflicts in the software. User code written for the A.22.xx or A.23.xx instrument software which used the old form must be rewritten to use the form below.

Remote Command	<code>:TRIGger[:SEquence]:INTernal:SOURce:OUTPut:POLarity POSitive NEGative</code>
----------------	--

6 Input/Output
6.8 Trigger Output

	<code>:TRIGger[:SEquence]:INTernal:SOURce:OUTPut:POLarity?</code>
Example	<code>:TRIG:INT:SOUR:OUTP:POL POS</code>
Dependencies	Only available on VXT models
Preset	Unaffected by Preset , but set to POSitive by Restore Input/Output Defaults or Restore System Defaults->All
State Saved	Saved in instrument state

6.9 Calibration

Allows you to configure the Comb Calibrator. This tab only appears when an RCal license is installed. Settings associated with the Calibrator are configured here.

6.9.1 Configuration

Opens the dialog shown below. This is a full screen dialog. Configuring of Cals is done using this dialog. The table consists of rows of Cals and Columns of Cal settings. You can scroll or swipe vertically or horizontally to view Cals or settings not currently shown on the screen.

Dialog with Example Table entries:

6.9.1.1 Cal Group

This is the same as "Cal Group" on page 3176 in the Calibration tab.

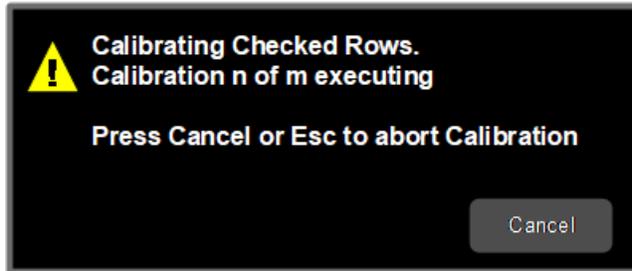

6.9.1.2 Calibrate Checked Rows

Executes the Cals within the currently selected Cal Group that have the Calibrate box checked in the RCal Configuration Table.

Once selected, the following dialog box is displayed;

When you click OK, the following dialog is displayed;

If there are multiple Cals being executed in a Cal Group, this dialog advises you when each Cal is complete. It also provides the ability to abort the Execute Cal Request. If you choose to abort, calibrations that have completed use the new Cal data and update the Last Cal field. Calibrations that have not completed retain the existing Cal data and Last Cal timestamp, or show “---” if the Cal had never been executed.

Remote Command	<code>:SYSTem:CALibration:INITiate:SElected</code>
Example	<code>:SYST:CAL:INIT:SEL</code>
Notes	Cals cannot be applied until they have been calibrated. Once a Cal has been calibrated, the Last Cal field in the table displays the date and time the Cal was last calibrated
Dependencies	Applied to the currently selected Cal Group
Couplings	Calibrate Selected is disabled if there are no Calibrate checkboxes checked. If the disabled control is selected, the advisory message “Check the Calibrate box for the Cals you want to calibrate” is displayed

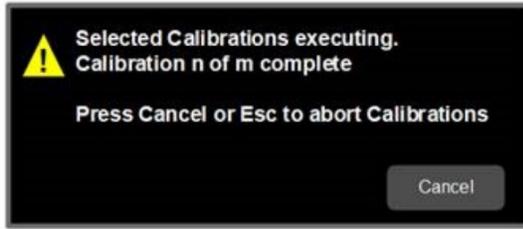

6.9.1.3 Apply Cal Group

This is the same as ["Apply Cal Group" on page 3177](#) in the **Calibration** tab.

6.9.1.4 Abort Calibration

Aborts the Calibration routine of the currently selected Cal Group

Remote Command	<code>:SYSTem:CALibration:ABORt</code>
Example	<code>:SYST:CAL:ABOR</code>
Dependencies	Aborts the currently running calibration. The previously-run calibrations will still be available, but the current calibration is halted, and next calibrations selected are not executed. Once the calibration starts, the modal dialog appears, and the abort can be executed by selecting Cancel

6.9.1.5 Copy From Cal Group

Determines the Cal Group from which existing rows are copied when using the "Copy" on page 3145 Group feature.

Remote Command	:SYSTem:CALibration:CGRoup:COPY:FROM <integer> :SYSTem:CALibration:CGRoup:COPY:FROM?
----------------	---

Example	:SYST:CAL:CGR:COPY:FROM 2 :SYST:CAL:CGR:COPY:FROM?
---------	---

Preset	1
Min	1
Max	100

6.9.1.6 Copy

Allows you to copy the settings in the Cal Group specified by the **Copy From Cal Group** parameter.

All the rows in the table are copied to the selected Cal Group. The columns **Apply**, **Last Cal** and **Applied** are set to their default values.

The group level parameters are also copied, with the exception of **Apply Cal Group** and **Copy From Cal Group**.

Remote Command	:SYSTem:CALibration:CGRoup:COPY
----------------	---------------------------------

Example	:SYST:CAL:CGRoup:COPY
---------	-----------------------

Dependencies	Applied to the currently selected Cal Group
--------------	---

Couplings	Disabled if Copy From Cal Group is the same as the currently selected Cal Group. If the disabled control is selected, the advisory message "Unable to Copy from same Cal Group" is displayed, and the same message is returned remotely as a Settings Conflict If you attempt to copy from a Cal Group that is empty, the advisory message "Copy From Cal Group is empty" is displayed, and the same message is returned remotely as a Settings Conflict
-----------	--

6.9.1.7 Cal Input

Maps the currently selected Cal Group to a particular I/O port. This control allows any Input port (including External Mixing, the RF2 input, etc.) to be mapped to a specific Cal Group

Remote Command	<code>:SYSTem:CALibration:INPut RFIN RFIN2 EMIXer ERFIN</code> <code>:SYSTem:CALibration:INPut?</code>
Example	<code>:SYST:CAL:INPut RFIN2</code>
Dependencies	<code>RFIN2</code> <code>EMIXer</code> are only available on C/E/M/P/UXA analyzers with the appropriate options loaded <code>ERFIN</code> is only available if a V3050A unit is connected
State Saved	Saved in State

Parameters, notes and examples. Note that the presence of these ports is highly hardware dependent.

Cal Input	Example	Note
RF Input	<code>:SYST:CAL:INPut RFIN</code>	Main RF Port Not available on EXM with hardware M9431A
RF Input 2	<code>:SYST:CAL:INPut RFIN2</code>	Second RF Port, labeled RF Input 2 Only available on certain instruments
External Mixer	<code>:SYST:CAL:INPut EMIX</code>	Requires option EXM
External RF	<code>:SYST:CAL:INPut ERFIN</code>	Only available if a V3050A unit is connected

6.9.1.8 Freq Offset

Specifies any frequency offset that is to be applied to the currently selected Cal Group. This can be used when using an external mixer.

Remote Command	<code>:SYSTem:CALibration:FREQuency:OFFSet <freq></code> <code>:SYSTem:CALibration:FREQuency:OFFSet?</code>
Example	<code>:SYST:CAL:FREQ:OFFS 1e9</code>
Dependencies	The SCPI query applies to the currently selected Cal Group
Preset	All 0 Hz
State Saved	Saved in instrument state
Min	0 Hz
Max	100.0 GHz

6.9.1.9 Select Calibrator

Selects the calibrator for the currently selected Cal Group to use for executing the calibration when multiple modules are connected.

Remote Command	<code>:SYSTem:CALibration:MODule:SElect NONE RCM1 RCM2 RCM3 RCM4 RCM5 RCM6 RCM7 RCM8 RCM9 RCM10</code> <code>:SYSTem:CALibration:MODule:SElect?</code>
Example	<code>:SYST:CAL:MODule:SElect RCM1</code>
Notes	Details of the RCal module are displayed beneath the control. If there are no modules connected, the text states "No Modules Connected" For SCPI, if the parameter sent is for a module that is not currently connected to the instrument, the message "Selected RCal module not connected" is generated
Dependencies	The SCPI command is applied to the currently selected Cal Group
State Saved	Saved in instrument state
Range	All connected RCal modules

6.9.1.10 Identify RCal Module

Control to connect to the RCal module of the currently selected Cal Group and blink its identity light

Remote Command	No remote command, front panel only
----------------	-------------------------------------

6.9.1.11 RCal Module Serial Number (Remote Query Only)

Returns the serial number of the specified module

Remote Command	<code>SYSTem:CALibration:MODule[1] 2 ... 10:SNUMber?</code>
Example	<code>:SYST:CAL:MOD:SNUM?</code>
Notes	If there is no module associated with the specified module number, returns an empty string

6.9.1.12 RCal Reference

Determines the reference type used by the RCal module of the currently selected Cal Group

Remote Command	<code>:SYSTem:CALibration:REFerence INTernal EXTernal</code> <code>:SYSTem:CALibration:REFerence?</code>
----------------	---

Example	<code>:SYST:CAL:REF EXT</code>
Dependencies	The SCPI command is applied to the currently selected Cal Group
Preset	<code>EXTernal</code>
State Saved	Saved in instrument state
Range	<code>INTernal EXTernal</code>

6.9.1.13 RCal Status

Opens a dialog that is used to provide the status of all active rows in all groups. Status can be one of the following; Calibrated, Applied, Calibration Failed or Apply Failed.

If a Calibration Fails, an error icon will be shown in the Calibrate column of the row (s) that failed with a message indicating the nature of the failure. If the failure cannot be addressed by the user, the error message “Calibration Failed. See Error Log” will be shown and details of the failure will be written to the SA Event Log.

Applying the Calibration can result in a warning if there is a mismatch between the currently executing instrument state and any of the following parameter settings;

- Cal Input
- Frequency
- IF Path
- IF Gain
- Phase Noise Optimization
- Preamp
- Coupling
- Mechanical Attenuator
- Electrical Attenuator
- Full Range Attenuator
- uW Path Control
- Mixing Mode
- External Mixer

When there is a mismatch a warning icon will be shown in the Applied column of the row(s) that had the mismatch with details in the format “<Parameter Name> does not match meas state”.

The Status dialog provides you with the group and row of a Calibration and its current state and any error details if the status is not ok. Table format shown below:

Calibration Configuration		Cal Status	
Group	Row	Calibrate Status	Apply Status
1	1	Not Calibrated	Not Applied
1	2	 Insufficient RCal power to perform the calibration.	Not Applied
2	1	 Calibrated	 IF Type Mismatch.
2	2	 Calibrated	 Applied

RCal Status (Remote Query Only)

Returns a comma-separated list of the status of an individual row status in the format “Group”, “Row”, ‘Status’, “Details”

Remote Command `:SYSTem:CALibration:ROW[1]|2|...|100:STATus?`

Example `:SYST:CAL:ROW2:STAT?`

Returns a comma-separated list of the status of an individual row status in the format “Group”, “Row”, ‘Status’, “Details”

Dependencies The SCPI command is applied to the currently selected Cal Group. The subopcode is used to identify the Cal row in the Cal Group

If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated

All RCal Status (Remote Query Only)

Returns a comma-separated list of all entries in the Cal Status table in the format “Group”, “Row”, ‘Status’, “Details”, which is repeated for each row in the table. If there are no entries in the table, returns an empty string.

Remote Command	<code>:SYSTem:CALibration:STATus:ALL?</code>
Example	<code>:SYST:CAL:STAT:ALL?</code> Returns a comma-separated list of all entries in the Cal Status table in the format “Group”, “Row”, ‘Status’, “Details”, which are repeated for each row in the table

6.9.1.14 Go to Row

Sets the selected row in the Cal table for the currently selected Cal Group.

Notes	You can only go to a row that has already been added
Preset	1
State Saved	Saved in instrument state
Min	1
Max	32

6.9.1.15 Insert Row Below

Adds a new row to the currently selected Cal Group, under the currently selected row in the table or after the sub opcode used in the SCPI command. The default values for each of the settings in the row is used.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:INSert</code>
Example	<code>:SYST:CAL:ROW2:INSert</code>
Dependencies	The SCPI command is applied to the currently selected Cal Group. The subopcode is used to identify the Cal row in the Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated

6.9.1.16 Description

Provides a description for the currently selected Cal Group from which the operator can easily identify the Cal Group.

Remote Command	<code>:SYSTem:CALibration:DESCription "Description"</code>
----------------	--

	<code>:SYSTem:CALibration:DESCription?</code>
Example	<code>:SYST:CAL:DESC "Description"</code>
Notes	Also shown on the Calibration menu panel, but limited to the first 18 characters
Dependencies	The SCPI command is applied to the currently selected Cal Group
State Saved	Saved in instrument state

6.9.1.17 Use Current Meas

Takes the settings from the current running measurement state to populate the Cal Row settings of the currently selected Cal Group.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:UCMeas</code>
Example	<code>:SYST:CAL:ROW2:UCM</code>
Dependencies	<p>The SCPI command is applied to the currently selected Cal Group. The subopcode is used to identify the Cal row in the Cal Group</p> <p>If the group table is empty and subopcode is omitted or 1, a new row is created and populated using the current running measurement</p> <p>If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221,Settings conflict; Subopcode does not reference an existing Cal row” is generated</p> <p>-221, Settings conflict; Feature not supported for this measurement</p>

6.9.1.18 Duplicate Row

Creates a new row the currently selected row, and populates the new row with the settings from the selected row of the currently selected Cal Group

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:DUPLicate</code>
Example	<code>:SYST:CAL:ROW2:DUPL</code>
Dependencies	<p>The SCPI command is applied to the currently selected Cal Group. The subopcode is used to identify the Cal row in the Cal Group</p> <p>If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221,Settings conflict; Subopcode does not reference an existing Cal row” is generated</p>

6.9.1.19 Delete Row

Deletes the settings from the selected row of the currently selected Cal Group

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:DELeTe</code>
Example	<code>:SYST:CAL:ROW2:DEL</code>
Notes	Disabled if the Cal Group contains no Cal rows

Dependencies	The SCPI command is applied to the currently selected Cal Group. The subopcode is used to identify the Cal row in the Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated
--------------	---

6.9.1.20 Delete All

Deletes all the Cals in the currently selected Cal Group

Remote Command	<code>:SYSTem:CALibration:DELeTe:ALL</code>
Example	<code>:SYST:CAL:DEL:ALL</code>
Notes	Disabled if the Cal Group contains no Cal rows
Dependencies	The SCPI command is applied to the currently selected Cal Group

6.9.1.21 Calibrate

Determines whether the Cal row should be included when Calibrate Selected is executed.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:CALibrate:STATe ON OFF 1 0</code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:CALibrate:STATe?</code>
Example	<code>:SYST:CAL:ROW2:CAL:STAT ON</code> <code>:SYST:CAL:ROW2:CAL:STAT?</code>
Dependencies	The SCPI command is applied to the currently selected Cal Group. The subopcode is used to identify the Cal row in the Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated
Preset	All OFF
State Saved	Saved in instrument state
Range	ON OFF

6.9.1.22 Apply

Determines the Cal that is applied.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:APPLy:STATe ON OFF 1 0</code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:APPLy:STATe?</code>
Example	<code>:SYST:CAL:ROW2:APPL:STAT ON</code> <code>:SYST:CAL:ROW2:APPL:STAT?</code>
Dependencies	The SCPI command is applied to the currently selected Cal Group. The subopcode is used to identify

	<p>the Cal row in the Cal Group</p> <p>If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated</p> <p>You can only check the Apply checkbox for a Cal that has been executed. If you attempt to select the Apply checkbox for Cal’s that have not been executed, the advisory message “Cal must be executed before it can be applied” is displayed</p> <p>If Apply Cal is ON, and you attempt to check the Apply checkbox for a Cal that is invalid for use with the current measurement state, the error “Cal invalid with current measurement settings is shown, and the checkbox remains unchecked</p>
Couplings	When the Apply check box is checked, if the Apply Cal Group setting is OFF , it will be turned on. Calibrations are only applied when the Apply Cal Group is ON
Preset	All OFF
State Saved	Saved in instrument state
Range	ON OFF
Annotation	If any Cal check box in any group is checked and Apply Cal Group for that group is ON , RCal in the Meas Bar displays in amber to indicate Calibrations are in use

6.9.1.23 Name

Sets an ASCII text field allowing you to name the selected Cal

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:NAME <string></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:NAME?</code>
Example	<code>:SYST:CAL:ROW2:NAM "Monday AM Cal"</code>
Notes	45 chars max; may not fit on display if max chars used
Dependencies	<p>The SCPI command is applied to the currently selected Cal Group. The subopcode is used to identify the Cal row in the Cal Group</p> <p>If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated</p>
Preset	“Cal #”, where # is corresponding Cal number
State Saved	Saved in instrument state

6.9.1.24 Last Cal

Displays the date and time the selected Cal was last executed. Read only field.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:LAST?</code>
Example	<code>:SYST:CAL:ROW2:LAST?</code>
	Returns data and time Cal 2 was last executed
Notes	Returns a string containing the date and time the Cal was executed. If the Cal has never been

	executed, or any of the settings are changed, SCPI returns an empty string, and the front panel displays "---"
Dependencies	The SCPI query applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated

6.9.1.25 Cal Applied

Displays the status of a Cal once it is applied. Is either Yes or No, depending on if the Cal was successfully applied or not. See RCalStatus for more details. If it is not being applied, the field shows "---". Read-only field.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:CAPPlied?</code>
Example	<code>:SYST:CAL:ROW2:CAPP?</code> Returns Cal Stats of Cal 2
Notes	Returns a string containing the date and time the Cal was executed. If the Cal has never been executed, or any of the settings are changed, SCPI returns an empty string, and the front panel displays "---"
Dependencies	The SCPI query applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated

6.9.1.26 Cal Type

Specifies how the calibration is to be performed on the selected Cal. Options are;

- **MAGNitude**: A single CW tone is measured at the center of the screen for each frequency point
- **COMPLex**: A comb signal is measured across the full IF passband at each frequency point. Magnitude and Phase are measured

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:TYPE MAGNitude COMPLex</code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:TYPE?</code>
Example	<code>:SYST:CAL:ROW2:TYPE COMP</code>
Dependencies	Only available if the selected RCal module has a license for complex calibrations. If it does not, this control is disabled The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated
Preset	MAGNitude

State Saved	Saved in instrument state
Range	MAGNitude COMPLex

6.9.1.27 Start Freq

Specifies the start frequency of the selected Cal.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FREQUENCY:START <freq></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FREQUENCY:START?</code>
Example	<code>:SYST:CAL:ROW2:FREQ:STAR 1e9</code>
Notes	Max values depend on Hardware Options (503, 507, 508, 513, 526)
Dependencies	The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated By direct entry: You cannot set Start Frequency > Stop Frequency. You can set the Start frequency = Stop frequency. If you set Start Frequency = Stop Frequency, "Freq Step" on page 3156 is adjusted to 0, and "Freq Points" on page 3157 is adjusted to 1 With the knob or step keys: If you set Start Frequency = Stop Frequency, Freq Step is adjusted to 0, and Freq Points is adjusted to 1
Couplings	If you change the start frequency of the selected range to a value > the range's stop frequency, the stop frequency of the previous range is changed to the same value. Freq Step is set to 0 Hz and Freq Points is set to 1 If you change the start frequency <= min frequency of the instrument, the start frequency of the selected range is set to the minimum frequency of the instrument If you change the start frequency >= maximum frequency of the instrument, the start frequency of the selected range is set to the maximum frequency of the instrument and the stop frequency of selected range is set to the maximum frequency of the instrument. Freq Step is set to 0 Hz and Freq Points is set to 1
Preset	Depends on the instrument maximum frequency
State Saved	Saved in instrument state
Min	If Scale Type is set to Lin, the min Start Frequency changes to -80 MHz
Max	Depends on the instrument maximum frequency – 10 Hz minimum span

6.9.1.28 Stop Freq

Specifies the stop frequency of the selected Cal.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FREQUENCY:STOP <freq></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FREQUENCY:STOP?</code>
----------------	--

Example	<code>:SYST:CAL:ROW2:FREQ:STOP 1e9</code>
Notes	Max values depend on Hardware Options
Dependencies	<p>The SCPI command applies to the currently selected Cal Group</p> <p>If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated</p> <p>By direct entry:</p> <p>You cannot set Stop frequency < Start frequency. You cannot set Start frequency = Stop frequency. You can set Start frequency = Stop frequency. If you set Start Frequency = Stop Frequency, "Freq Step" on page 3156 is adjusted to 0, and "Freq Points" on page 3157 is adjusted to 1</p> <p>With the knob or step keys:</p> <p>If you set Start Frequency = Stop Frequency, Freq Step is adjusted to 0, and Freq Points is adjusted to 1</p>
Couplings	<p>If you change the stop frequency of the selected range to a value < the range's start frequency the start frequency of the range is changed to the same value. Freq Step is set to 0 Hz and Freq Points is set to 1</p> <p>If you change the stop frequency >=the maximum frequency of the instrument, the stop frequency of the selected range is set to the maximum frequency of the instrument</p> <p>If you change stop frequency <= the minimum frequency of the instrument, the stop frequency of the selected range is set to the minimum frequency of the instrument and the start frequency of the selected range is set to the minimum frequency of the instrument. Freq Step is set to 0 Hz and Freq Points is set to 1</p>
Preset	Depends on the instrument maximum frequency
State Saved	Saved in instrument state
Min	If Scale Type is set to Lin, the min Stop Frequency is changed to -79.999990 MHz
Max	Depends on the instrument maximum frequency

6.9.1.29 Freq Step

Specifies the step frequency of the selected Cal. This determines the points between the start and stop frequencies to use for Calibration.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FREQuency:STEP <freq></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FREQuency:STEP?</code>
Example	<code>:SYST:CAL:ROW2:FREQ:STEP 1e9</code>
Notes	Max values depend on Hardware Options
Dependencies	<p>The SCPI command applies to the currently selected Cal Group</p> <p>If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated</p> <p>You cannot set Freq Step > Stop frequency - Start frequency</p> <p>Attempts to set Freq Step > Stop frequency - Start frequency results in Freq Step being set to Stop frequency - Start frequency</p>

Couplings	Coupled to " Freq Points " on page 3157. Changing Freq Step adjusts Freq Points using $\frac{((\text{Stop Freq} - \text{Start Freq}) / \text{Freq Step}) + 1}$ and clips to the next integer value, which may result in Freq Step being clipped too If Freq Step is set to a value $> \text{Stop Freq} - \text{Start Freq}$ Stop Freq is increased, and Freq Points is set to 1
Preset	All 10 kHz
State Saved	Saved in instrument state
Min	1 Hz
Max	Depends on the instrument maximum frequency

6.9.1.30 Freq Points

Specifies the frequency points of the selected Cal. This determines the points between the start and stop frequencies to use for Calibration.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FREQUENCY:POINTs</code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FREQUENCY:POINTs?</code>
Example	<code>:SYST:CAL:ROW2:FREQ:POIN 100</code>
Couplings	Coupled to " Freq Step " on page 3156. Changing Freq Points adjusts Freq Step using $\frac{(\text{Stop Freq} - \text{Start Freq})}{(\text{Freq Points} - 1)}$ and clips to the next integer value, which may result in Freq Step being clipped
Preset	1
Min	1
Max	100000

6.9.1.31 Mech Atten Type

Specifies the Mech Atten type to use:

- **STEP**: Use multiple Mech Atten states determined by Mech Atten Start, Mech Atten Stop and Mech Atten Step
- **ALL**: Use all the attenuator states
- **BYPass**: Bypasses the attenuator

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:ATTenuation:TYPE STEP ALL BYPass</code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:ATTenuation:TYPE?</code>
Example	<code>:SYST:CAL:ROW3:ATT:TYPE STEP</code>
Dependencies	The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221,Settings conflict; Subopcode does not reference an existing Cal row” is generated

Preset	STEP
State Saved	Saved in instrument state
Range	STEP ALL BYPass

6.9.1.32 Mech Atten Start

Determines the first Mechanical Attenuator to be used in the Calibration

Remote Command	:SYSTem:CALibration:ROW[1] 2 ... 100:ATTenuation:START <rel_amp1> :SYSTem:CALibration:ROW[1] 2 ... 100:ATTenuation:START?
Example	:SYST:CAL:ROW3:ATT:START 20
Dependencies	Disabled unless " Mech Atten Type " on page 3157 is STEP The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221,Settings conflict; Subopcode does not reference an existing Cal row" is generated
Couplings	Coupled to " Mech Atten Stop " on page 3158. Mech Atten Start must be <= Mech Atten Stop . If Mech Atten Start > Mech Atten Stop , then Mech Atten Stop = Mech Atten Start
Preset	10 dB
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. To get to a value below 6 dB it must be directly entered from the keypad or via SCPI. This protects from adjusting the attenuation to a dangerously small value, which can put the instrument at risk of damage to input circuitry. However, if the current mechanical attenuation is below 6 dB it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that, in the single attenuator configuration, the total of ATT and EATT cannot exceed 50 dB, so if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and is reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB

6.9.1.33 Mech Atten Stop

Determines the last Mechanical Attenuator to be used in the Calibration

Remote Command	:SYSTem:CALibration:ROW[1] 2 ... 100:ATTenuation:STOP <rel_amp1> :SYSTem:CALibration:ROW[1] 2 ... 100:ATTenuation:STOP?
Example	:SYST:CAL:ROW3:ATT:STOP 30
Dependencies	Disabled unless " Mech Atten Type " on page 3157 is STEP

	<p>The SCPI command applies to the currently selected Cal Group</p> <p>If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221,Settings conflict; Subopcode does not reference an existing Cal row” is generated</p>
Couplings	Coupled to "Mech Atten Start" on page 3158. Mech Atten Start must be \leq Mech Atten Stop . If Mech Atten Start $>$ Mech Atten Stop , then Mech Atten Stop = Mech Atten Start
Preset	10 dB
State Saved	Saved in instrument state
Min	<p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. To get to a value below 6 dB it must be directly entered from the keypad or via SCPI. This protects from adjusting the attenuation to a dangerously small value which can put the instrument at risk of damage to input circuitry. However, if the current mechanical attenuation is below 6 dB it can be increased with the knob and step keys, but not decreased</p>
Max	<p>CXA Option 503 or 507: 50 dB</p> <p>EXA: 60 dB</p> <p>All other models: 70 dB</p> <p>Note that, in the single attenuator configuration, the total of ATT and EATT cannot exceed 50 dB, so if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and is reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>

6.9.1.34 Mech Atten Step

Determines the Mech Attenuation Step. This determines the points between the Mechanical Attenuation min and max to use for Calibration.

Remote Command	<pre>:SYSTem:CALibration:ROW[1] 2 ... 100:ATTenuation:STEP <rel_amp1></pre> <pre>:SYSTem:CALibration:ROW[1] 2 ... 100:ATTenuation:STEP?</pre>
Example	<pre>:SYST:CAL:ROW2:ATT:STEP 2dB</pre>
Dependencies	<p>Disabled unless "Mech Atten Type" on page 3157 is STEP</p> <p>The SCPI command applies to the currently selected Cal Group</p> <p>If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated</p>
Preset	2 dB
State Saved	Saved in instrument state
Min	2 dB
Max	10 dB

6.9.1.35 Elec Atten Type

Specifies the Elec Atten type to use:

- **STEP**: Use multiple Elec Atten states determined by Elec Atten Start, Elec Atten Stop and Elec Atten Step
- **ALL**: Use all the attenuator states
- **BYPass**: Bypasses the attenuator

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:EATTenuation:TYPE STEP ALL BYPass</code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:EATTenuation:TYPE?</code>
Example	<code>:SYST:CAL:ROW3:EATT:TYPE STEP</code>
Dependencies	The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated
Preset	STEP
State Saved	Saved in instrument state
Range	STEP ALL BYPass

6.9.1.36 Elec Atten Start

Determines the first Electronic Attenuator to be used in the Calibration

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:EATTenuation:START <rel_amp></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:EATTenuation:START?</code>
Example	<code>:SYST:CAL:ROW3:EATT:START 0</code>
Dependencies	<p>Only appears in Dual Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single Attenuator configuration, as in the single attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator (which has both a mechanical and electronic stage)</p> <p>Disabled unless "Elec Atten Type" on page 3159 is STEP</p> <p>The electronic attenuator is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, or 0-3 GHz, depending on the model). If the low band ranges from 0-3.6 GHz, and Stop Frequency of the Calibration is > 3.6 GHz, then this parameter is grayed out</p> <p>If the Internal Preamp is on, meaning it is set to Low Band or Full, or the electronic attenuator is unavailable, then this parameter is grayed-out</p> <p>If either of the above is true, and if the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is sent</p> <p>If both of the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>The SCPI command applies to the currently selected Cal Group</p> <p>If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated</p>

Couplings	Coupled to Elec Atten Stop. Elec Atten Start must be \leq Elec Atten Stop. If Elec Atten Start $>$ Elec Atten Stop, Elec Atten Stop = Elec Atten Start
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	24 dB

6.9.1.37 Elec Atten Stop

Determines the last Electrical Attenuator to be used in the Calibration

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:EATTenuation:STOP <rel_amp1></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:EATTenuation:STOP?</code>
Example	<code>:SYST:CAL:ROW3:EATT:STOP 10</code>
Dependencies	<p>Only appears in Dual Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single Attenuator configuration, as in the single attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator (which has both a mechanical and electronic stage)</p> <p>Disabled unless "Elec Atten Type" on page 3159 is STEP</p> <p>The electronic attenuator is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz or 0-3 GHz, depending on the model). If the low band ranges from 0-3.6 GHz, and Stop Frequency of the Calibration is $>$ 3.6 GHz, then this parameter is grayed out</p> <p>If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator is unavailable, then this parameter is grayed out</p> <p>If either of the above is true, and if the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is sent</p> <p>If both of the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>For SCPI, this query applies to the currently selected Cal Group</p> <p>If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated</p>
Couplings	Coupled to Elec Atten Start. Elec Atten Stop must be \geq Elec Atten Start. If Elec Atten Stop $<$ Elec Atten Start, Elec Atten Start = Elec Atten Stop
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	24 dB

6.9.1.38 Elec Atten Step

Determines the Elec Attenuation Step. This determines the points between the Electric Attenuation min and max to use for Calibration.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:EATTenuation:STEP <rel_ampl></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:EATTenuation:STEP?</code>
Example	<code>:SYST:CAL:ROW2:EATT:STEP 2dB</code>
Dependencies	Disabled unless "Elec Atten Type" on page 3159 is STEP The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated
Preset	1 dB
State Saved	Saved in instrument state
Min	1 dB
Max	24 dB

6.9.1.39 Full Range Atten Type

Specifies the Full Range Atten type to use. The Full Range Attenuator adds a second input attenuator at the beginning of the RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

- **STEP**: Use multiple Full Range Atten states determined by Full Range Atten Start and Full Range Atten Stop
- **ALL**: Use all the attenuator states

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FATTenuation:TYPE STEP ALL </code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FATTenuation:TYPE?</code>
Example	<code>:SYST:CAL:ROW3:FATT:TYPE STEP</code>
Dependencies	Only appears if input RF is selected, and RF Input Port 2 is selected, and the Full Range Attenuator exists The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated
Preset	STEP
State Saved	Saved in instrument state
Range	STEP ALL

6.9.1.40 Full Range Atten Start

Determines the first Full Range Attenuator to be used in the Calibration

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FATTenuation:START <rel_amp1></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FATTenuation:START?</code>
Example	<code>:SYST:CAL:ROW3:FATT:START 0</code>
Dependencies	Only appears in SP900S, when the RF input is selected, and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed Disabled unless " Full Range Atten Type " on page 3162 is STEP The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated
Couplings	Coupled to Full Range Atten Stop. Full Range Atten Start must be \leq Full Range Atten Stop. If Full Range Atten Start $>$ Full Range Atten Stop, Full Range Atten Stop = Full Range Atten Start
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB

6.9.1.41 Full Range Atten Stop

Determines the last Full Range Attenuator to be used in the Calibration

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FATTenuation:STOP <rel_amp1></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FATTenuation:STOP?</code>
Example	<code>:SYST:CAL:ROW3:FAT:PT:STOP 10</code>
Dependencies	Only appears in SP900S, when the RF input is selected, and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed Disabled unless " Full Range Atten Type " on page 3162 is STEP The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated
Couplings	Coupled to Full Range Atten Start. Full Range Atten Stop must be \geq Full Range Atten Start. If Full Atten Stop $<$ Full Range Atten Start, Full Range Atten Start = Full Range Atten Stop
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB

6.9.1.42 Frequency Extender Attenuation Type

Specifies the Frequency Extender Attenuation type to use. **Frequency Extender Attenuation** is applied to the frequency extender's high frequency input signal path (for example, with a V3050A frequency extender, the high frequency path is 50 GHz to 110 GHz).

- **STEP**: Use multiple Frequency Extender Attenuation states determined by Frequency Extender Attenuation Start and Frequency Extender Attenuation Stop
- **ALL**: Use all the attenuator states

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FEATtenuation:TYPE STEP ALL</code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100: FEATtenuation:TYPE?</code>
Example	<code>:SYST:CAL:ROW3:FEAT:TYPE STEP</code>
Dependencies	Only applies, and is only visible, when the External RF (ERFIN) input is selected The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated
Preset	STEP
State Saved	No
Range	STEP ALL REFERENCE

6.9.1.43 Frequency Extender Attenuation Start

Determines the first Frequency Extender Attenuator to be used in the Calibration.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FEATtenuation:START <rel_amp1></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FEATtenuation:START?</code>
Example	<code>:SYST:CAL:ROW3:FEAT:START 0</code>
Dependencies	Only applies, and is only visible, when the External RF (ERFIN) input is selected Disabled unless " Frequency Extender Attenuation Type " on page 3164 is STEP The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated
Couplings	Coupled to Frequency Extender Attenuation Stop. Frequency Extender Attenuation Start must be <= Frequency Extender Attenuation Stop. If Frequency Extender Attenuation Start > Frequency Extender Attenuation Stop, Frequency Extender Attenuation Stop = Frequency Extender Attenuation Start
Preset	0 dB
State Saved	Saved in instrument state

Min	0 dB
Max	V3050A: 26 dB

6.9.1.44 Frequency Extender Attenuation Stop

Determines the last Frequency Extender Attenuation to be used in the Calibration.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FEATtenuation:STOP <rel_ampl></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FEATtenuation:STOP?</code>
Example	<code>:SYST:CAL:ROW3:FEAT:PT:STOP 26</code>
Dependencies	Only applies, and is only visible, when the External RF (ERFIN) input is selected Disabled unless " Frequency Extender Attenuation Type " on page 3164 is STEP The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated
Couplings	Coupled to Frequency Extender Attenuation Start. Frequency Extender Attenuation Stop must be \geq Frequency Extender Attenuation Start. If Frequency Extender Attenuation Stop $<$ Frequency Extender Attenuation Start, Frequency Extender Attenuation Start = Frequency Extender Attenuation Stop
Preset	26 dB
State Saved	Saved in instrument state
Min	0 dB
Max	V3050A: 26 dB

6.9.1.45 Frequency Extender Atten Step

Determines the Frequency Extender Attenuation Step. This determines the points between the Frequency Extender Attenuation min and max to use for Calibration.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FEATtenuation:STEP <rel_ampl></code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FEATtenuation:STEP?</code>
Example	<code>:SYST:CAL:ROW2:FEAT:STEP 2dB</code>
Dependencies	Only applies, and is only visible, when the External RF (ERFIN) input is selected The SCPI command applies to the currently selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated
Preset	1 dB
State Saved	No
Min	1 dB
Max	V3050A: 26 dB

6.9.1.46 IF Path

Determines the IF Path to be used in the Calibration.

Remote Command `:SYSTem:CALibration:ROW[1]|2|...|100:IF:PATH B10M | B25M | B40M | B85M | B125M | B140M | B160M | B255M | B510M | B1G | B1500M | B2G | B4G | EXT`
`:SYSTem:CALibration:ROW[1]|2|...|100:IF:PATH?`

Example `:SYST:CAL:ROW2:IF:PATH B25M`

Notes	B10M	10 MHz
	B25M	25 MHz
	B40M	40 MHz
	B85M	85 MHz
	B125M	125 MHz
	B140M	140 MHz
	B160M	160 MHz
	B255M	255 MHz
	B510M	510 MHz
	B1G	1 GHz
	B1500M	1.5 GHz
	B2G	2 GHz
	B4G	4 GHz
	EXT	Depends on the hardware

In cases where the path is not available but is selected from SCPI, it generates an error - 241, "Hardware missing; Option not installed"

Dependencies

- The 25 MHz path is available only when 25 MHz or wider IF Bandwidth option is installed
- The 40 MHz path is available only when 40 MHz or wider IF Bandwidth option is installed
- The 85 MHz path is available only when 85 MHz or wider IF Bandwidth option is installed
- The 125 MHz path is available only when 125 MHz or wider IF Bandwidth option is installed
- The 140 MHz path is available only when Option B1X is installed
- The 160 MHz path is available only when Option B1Y is installed. There cannot be a B1Y option without a B1X option
- The 255 MHz path is available only when Option B2X or wider IF Bandwidth option is installed
- The 510 MHz path is available only when Option B5Y or wider IF Bandwidth option is installed
- The 1 GHz path is available only when Option H1G/B1G or wider IF Bandwidth option is installed
- The 2 GHz path is available only when Option B2G(R20) or wider IF Bandwidth option is installed
- The 4 GHz path is available only when Option B4G(R40) or wider IF Bandwidth option is installed
- The 1.5 GHz path is available only when license R15 option is installed

	<p>If Option B85 is installed, and also B1A or B1X is installed, the 85 MHz key does not appear, and the B85M SCPI selection is disabled. When the B85M SCPI is selected in this case, the instrument generates an error -221, "Settings Conflict; Use wider bandwidth selection"</p> <p>If Option B1A is installed, and also B1X is installed, the 125 MHz key does not appear, and the B125M SCPI selection is disabled. When the B125M SCPI is selected in this case, the instrument generates an error -221, "Settings Conflict; Use wider bandwidth selection"</p> <p>In cases where the path is not available, but is selected from SCPI, error -241, "Hardware missing; Option not installed" is generated</p> <p>The preset value depends on the Digital IF BW setting of the default measurement</p>
Preset	If the 25 MHz path is not available, presets to 10 MHz
State Saved	No
Range	B10M B25M B40M B85M B125M B140M B160M B255M B510M B1G B1500M B2G B4G EXT

6.9.1.47 IF Gain

Determines the IF Gain to be used in the Calibration

Remote Command	:SYSTem:CALibration:ROW[1] 2 ... 100:IF:GAIN[:STATE]AUTO HIGH LOW ALL :SYSTem:CALibration:ROW[1] 2 ... 100:IF:GAIN[:STATE]?
Example	:SYST:CAL:ROW3:IF:GAIN ALL
Dependencies	The SCPI command applies to the current selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated
Preset	AUTO
State Saved	Saved in instrument state
Range	Auto High Gain Low Gain All

6.9.1.48 Preamp

Determines if the Preamp is to be used in the Calibration

Remote Command	:SYSTem:CALibration:ROW[1] 2 ... 100:POWer[:RF]:GAIN:BAND.OFF LOW FULL :SYSTem:CALibration:ROW[1] 2 ... 100:POWer:GAIN:BAND?
Example	:SYST:CAL:ROW2:POWer:GAIN:BAND OFF
Dependencies	The SCPI command applies to the current selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message "-221, Settings conflict; Subopcode does not reference an existing Cal row" is generated
Preset	OFF
State Saved	Saved in instrument state
Range	OFF LOW FULL

6.9.1.49 Low Noise Amplifier (LNA)

Determines if the LNA is to be used in the Calibration.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:POWer[:RF]:GAIN:LNA[:STATe] ON OFF 1 0 :SYSTem:CALibration:ROW[1] 2 ... 100:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:SYST:CAL:ROW2:POW:GAIN:LNA ON :SYST:CAL:ROW2:POW:GAIN:LNA?</code>
Dependencies	The SCPI command is applied to the currently selected Cal Group. The subopcode is used to identify the Cal row in the Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated
Preset	OFF
State Saved	No
Range	ON OFF

6.9.1.50 μ W Path Control

Determines the μ W Path Control to be used in the Calibration.

Option	SCPI
Standard Path	STD
Low Noise Path	LNPath
μ W Presel Bypass	MPBypass
Full Bypass	FULL

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ...100POWer[:RF]:MW:PATH STD LNPath MPBypass FULL :SYSTem:CALibration:ROW[1] 2 ...100:POWer[:RF]:MW:PATH?</code>
Example	<code>:SYST:CAL:ROW2:POW:MW:PATH FULL</code>
Dependencies	The SCPI command applies to the current selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated This column is not shown in the table unless Option MPB is present and licensed or option LNB is present and licensed The Low Noise Path selection does not show unless option LNP is present and licensed The μ W Presel Bypass selection does not show unless option MPB is present and licensed The Full Bypass selection does not show unless options LNP, MPB and FBP are installed and licensed In any of these cases, if the required options are not present and the SCPI command is sent, error -

	241, "Hardware missing; Option not installed" is generated
Preset	STD
State Saved	Saved in instrument state
Range	STD LNPath MPBypass FULL

6.9.1.51 Coupling

Determines the Coupling to be used in the Calibration

Remote Command	:SYSTem:CALibration:ROW[1] 2 ... 100:COUPling AC DC :SYSTem:CALibration:ROW[1] 2 ... 100:COUPling?
Example	:SYST:CAL:ROW3:COUP AC
Dependencies	The SCPI command applies to the current selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated
Preset	AC
State Saved	Saved in instrument state
Range	AC DC

6.9.1.52 Phase Noise Optimization

Selects the LO (local oscillator) phase noise behavior for various desired operating conditions.

For full details, see ["Parameter Options & Installed Options" on page 3170](#) below.

Remote Command	:SYSTem:CALibration:ROW[1] 2 ... 100:FREQuency:SYNThesis[:STATe] 1 ... 5 For the meaning of each numeric option value, see "Parameter Options & Installed Options" on page 3170 below :SYSTem:CALibration:ROW[1] 2 ... 100:FREQuency:SYNThesis[:STATe]?
Example	:SYST:CAL:ROW1:FREQ:SYNT 2 selects optimization for best wide offset phase noise
Dependencies	The SCPI command applies to the current selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated
Couplings	Coupled with "Phase Noise Optimization All Option" on page 3175 When Phase Noise Optimization All is ON , selects all available LO mappings, and Phase Noise Optimization parameter will display All in the Configuration table. SCPI Query is still available to determine which parameter will be displayed when Phase Noise Optimization All is OFF

Preset	2
State Saved	Yes
Range	See "Ranges" on page 3174 below
Min	1
Max	5

Parameter Options & Installed Options

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 3171	1	<ul style="list-style-type: none"> – In instruments with EPO, balances close-in phase noise with spur avoidance – In instruments without EPO optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 3171	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 3172	3	Optimizes LO for tuning speed
"Best Close-in" on page 3171	4 or 1*	<ul style="list-style-type: none"> – In instruments with EPO, emphasizes close-in phase noise performance without regard to spur avoidance – In instruments without EPO, this setting is accepted but no action is taken
"Best Spurs" on page 3171	5	<ul style="list-style-type: none"> – In instruments with EPO, emphasizes spur avoidance over close-in phase noise performance – In instruments without EPO, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EPO installation. See ["Best Close-in" on page 3171](#) below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, ["Fast Tuning" on page 3172](#) is identical in effect to ["Best Close-in" on page 3171](#).

Best Close-in

Without option EPO

`:FREQ:SYNT 1`

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset < 20 kHz]

With option EPO

`:FREQ:SYNT 4`

In instruments with Option EPO, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 3171 setting, parameter 1 selects "Balanced" on page 3171 in EPO instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 3171, which is usually not as good a choice as "Balanced" on page 3171.

Balanced

`:FREQ:SYNT 1`

In instruments with EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Best Spurs

`:FREQ:SYNT 5`

In instruments with EPO, the LO is configured for better phase noise than the "Best Wide-offset" on page 3171 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 3171 case mostly within ± 1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 3171 case at better than -90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

`:FREQ:SYNT 2`

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "[Fast Tuning](#)" on page 3172 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EP0, this is the same configuration as "[Best Spurs](#)" on page 3171. It is available with the "[Fast Tuning](#)" on page 3172 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "[Fast Tuning](#)" on page 3172 option, the settings for "[Best Close-in](#)" on page 3171 are used if "[Fast Tuning](#)" on page 3172 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

`:FREQ:SYNT:AUTO ON`

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EPO Models with option EPO have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz Span > 114.1 MHz, <i>or</i> RBW > 800 kHz RBW > 290 kHz, <i>or</i> Span > 4.2 MHz Other conditions	"Balanced" on page 3171 "Fast Tuning" on page 3172 "Best Wide-offset" on page 3171 "Balanced" on page 3171
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, <i>or</i> RBW > 1.9 MHz, <i>or</i> Source Mode is set to "Tracking" Center frequency is < 195 kHz, <i>or</i> CF >= 1 MHz <i>and</i> Span <= 1.3 MHz <i>and</i> RBW <= 75 kHz All other conditions	"Fast Tuning" on page 3172 "Best Close-in" on page 3171 "Best Wide-offset" on page 3171
EP2 Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 3171; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)	CF < 130 kHz, <i>or</i> CF > 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 40 kHz Span > 22 MHz, <i>or</i> RBW > 400 kHz, <i>or</i> CF ≤ 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 23 kHz All other conditions	"Best Close-in" on page 3171 "Fast Tuning" on page 3172 "Best Wide-offset" on page 3171
EP4 (available in CXA for improved phase noise)	Span > 101 MHz <i>or</i> RBW > 1.15 MHz <i>or</i> Source Mode is set to "Tracking" CF is < 109 kHz <i>or</i> CF >= 4.95 MHz <i>and</i> Span <= 666 kHz <i>and</i> RBW < 28 kHz	"Fast Tuning" on page 3172 "Best Close-in" on page 3171

Models with Option	Conditions	Selection
	All other conditions	"Best Wide-offset" on page 3171
All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 3172 are actually the same as "Best Close-in" on page 3171, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning	Span > 12.34 MHz, <i>or</i> RBW > 250 kHz, <i>or</i> Source Mode is set to "Tracking"	"Fast Tuning" on page 3172
	Center frequency is < 25 kHz, <i>or</i> CF >= 1 MHz <i>and</i> Span <= 141.4 kHz <i>and</i> RBW <= 5 kHz	"Best Close-in" on page 3171
	All other conditions	"Best Wide-offset" on page 3171

In all the above cases:

- The RBW to be used in the calculations is the equivalent -3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EPO	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP1	1	Best Close-in	[offset < 140 kHz]
	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]

Option	Option #	Phase Noise Option	Range
EP2, EP3, EP5	1	Best Close-in	[offset < 70 kHz]
	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
EP4	1	Best Close-in	[offset < 90 kHz]
	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

6.9.1.53 Phase Noise Optimization All Option

Selects all available LO settings

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:FREQUENCY:SYNThesis:ALL[:STATE] ON OFF 1 0</code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:FREQUENCY:SYNThesis[:STATE]?</code>
Example	<code>:SYST:CAL:ROW1:FREQ:SYNT:ALL ON</code>
Notes	When this parameter is ON , it overrides the Phase Noise Optimization parameter, and selects all available LO settings
Dependencies	The SCPI command applies to the current selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated
Couplings	Coupled with Phase Noise Optimization . When this parameter is ON , it selects all available LO mappings, and Phase Noise Optimization parameter displays All in the Configuration table. When this parameter is OFF , the Phase Noise Optimization parameter displays its previously set value in the Configuration table
Preset	OFF
State Saved	Saved in instrument state
Range	ON OFF

6.9.1.54 Mixing Mode

Determines the LO Mixing Mode to be used.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:LO:MMODE NORMAl ALTeRnate ALL</code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:LO:MMODE?</code>
Example	<code>:SYST:CAL:ROW3:LO:MMOD NORM</code>
Dependencies	The SCPI command applies to the current selected Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221,Settings conflict; Subopcode does not reference an existing Cal row” is generated

Preset	<code>NORMa1</code>
State Saved	Saved in instrument state
Range	<code>NORMa1 ALTErnate ALL</code>

6.9.1.55 Match State

Determines if the Cal settings must match exactly when applying the correction. If not, the system may find the closest matching state or interpolate between states.

Remote Command	<code>:SYSTem:CALibration:ROW[1] 2 ... 100:MATCh[:STATe] ON OFF 1 0</code> <code>:SYSTem:CALibration:ROW[1] 2 ... 100:MATCh[:STATe]?</code>
Example	<code>:SYST:CAL4:MATC ON</code> <code>:SYST:CAL4:MATC?</code>
Dependencies	The SCPI command is applied to the currently selected Cal Group. The subopcode is used to identify the Cal row in the Cal Group If the subopcode does not reference an existing Cal row in the Cal Group, the error message “-221, Settings conflict; Subopcode does not reference an existing Cal row” is generated
Preset	All True
State Saved	Saved in instrument state
Range	True False

6.9.2 Cal Group

Specifies the selected Calibration Group. You can use different Cal Groups for different external hardware configurations. The Cal Group is also an important concept when sending SCPI commands to the Calibration System, because in each case the SCPI command is directed to the currently-selected Cal Group, which is the Cal Group that is modified by the SCPI command.

Remote Command	<code>:SYSTem:CALibration:CGRoup <integer></code> <code>:SYSTem:CALibration:CGRoup?</code>
Example	<code>:SYST:CAL:CGR 2</code> <code>:SYST:CAL:CGR?</code>
Preset	1
Min	1
Max	100

6.9.3 Apply Cal Group

Controls whether or not the checked **Apply** rows of the currently selected Cal Group are applied.

Remote Command	<code>:SYSTem:CALibration:CGROUP:APPLY <bool></code> <code>:SYSTem:CALibration:CGROUP:APPLY?</code>
Example	<code>:SYST:CAL:CGR:APPL ON</code> <code>:SYST:CAL:CGR:APPL?</code>
Dependencies	The SCPI command is applied to the currently selected Cal Group You can only turn on Apply Cal Group if at least one Cal for the currently selected group has been executed. If you attempt to select Apply Cal Group before any Cals have been executed, the advisory message "At least one Row must be calibrated before it can be applied" is displayed
Preset	<code>OFF</code>
State Saved	Saved in instrument state
Range	<code>ON OFF</code>
Annotation	If <i>any</i> Cal Group is turned on, RCal in the Meas Bar displays in amber, to indicate that Calibrations are in use

6.9.4 All Apply Cal Group Off

Turns **Apply Cal Group** off in all groups.

Remote Command	<code>:SYSTem:CALibration:CGROUP:APPLY:AOFF</code>
Example	<code>:SYST:CAL:CGR:APPL:AOFF</code>

6.9.5 Connection

Opens the Connection dialog, which provides step-by-step instructions for its use.

6.10 Calibrator Control

Allows you to select a calibrator and control the calibrator settings.

6.10.1 Select Cal Source

Allows you to select the calibrator to control.

Remote Command	<code>:SYSTem:CALibration:TUNE[:SElected] NONE REF50 REF4800 TUNAb1e CALOUT RCM1 RCM2 RCM3 RCM4 RCM5 RCM6 RCM7 RCM8 RCM9 RCM10</code> <code>:SYSTem:CALibration:TUNE[:SElected]?</code>
Example	<code>:SYST:CAL:TUNE:SEL TUNABLE</code> <code>:SYST:CAL:TUNE?</code>
Notes	The values translate as follows: <ul style="list-style-type: none">- NONE: No calibrator selected- TUNAb1e: Tunable internal calibrator present in SP900S- CALOUT: Tunable calibrator available through CALOUT front panel port in SP900S- REF50: 50 MHz calibrator- REF4800: 4.8 GHz calibrator- RCM1 – RCM10: RCal module
Dependencies	If the selected calibrator is not available, it will not appear in the dropdown. If sending SCPI to select a calibrator that is not available, the instrument will generate an error
Couplings	Selecting REF50 sets the RF Calibrator to REF50 Selecting REF4800 sets the RF Calibrator to REF4800 Selecting a calibrator source other than REF50 or REF4800 sets RF Calibrator to OFF
Preset	Unaffected by Mode Preset . Set to NONE by Restore Input/Output Defaults or Restore System Defaults->All

6.10.2 Cal Output

Allows you to set the selected calibrator's RF power output state.

Remote Command	<code>:SYSTem:CALibration:TUNE:OUTput[:STATe] ON OFF 1 0</code> <code>:SYSTem:CALibration:TUNE:OUTput[:STATe]?</code>
Example	<code>:SYST:CAL:TUNE:OUTP ON</code>

	<code>:SYST:CAL:TUNE:OUTP?</code>
Preset	Unaffected by Mode Preset . Set to OFF by Restore Input/Output Defaults or Restore System Defaults->All

6.10.3 Cal Frequency

Allows you to set the selected calibrator's frequency.

Remote Command	<code>:SYSTem:CALibration:TUNE:FREquency <freq></code> <code>:SYSTem:CALibration:TUNE:FREquency?</code>
Example	<code>:SYST:CAL:TUNE:FREQ 150000000</code> Sets source frequency to 150 MHz <code>:SYST:CAL:TUNE:FREQ?</code>
Preset	Unaffected by Mode Preset . Set to 1 GHz by Restore Input/Output Defaults or Restore System Defaults->All
Min/Max	Depend on the selected calibrator

6.10.4 Cal Signal Type

Allows you to set the selected calibrator's signal type.

Remote Command	<code>:SYSTem:CALibration:TUNE:TYPE CW COMB</code> <code>:SYSTem:CALibration:TUNE:TYPE?</code>
Example	<code>:SYST:CAL:TUNE:TYPE CW</code> <code>:SYST:CAL:TUNE:TYPE?</code>
Dependencies	If the selected calibrator does not support a signal type, then it will be disabled in the dropdown Changing the signal type to a disabled option will generate an error
Preset	Unaffected by Mode Preset . Set to CW by Restore Input/Output Defaults or Restore System Defaults->All

6.10.5 Cal Comb Spacing

Allows you to set the calibrator's comb spacing, when the signal type is Comb.

Remote Command	<code>:SYSTem:CALibration:TUNE:SPACing <freq></code> <code>:SYSTem:CALibration:TUNE:SPACing?</code>
Example	<code>:SYST:CAL:TUNE:SPAC 1000000</code> Sets comb spacing to 1 MHz <code>:SYST:CAL:TUNE:SPAC?</code>

6 Input/Output
6.10 Calibrator Control

Dependencies	Only appears when Comb is selected as Cal Signal Type If the selected calibrator does not support the Comb signal, attempting to set the spacing will generate an error
Preset	Unaffected by Mode Preset . Set to 0 Hz by Restore Input/Output Defaults or Restore System Defaults->All
Min/Max	Dependent on the selected calibrator

6.10.6 Calibrator Reference

Determines the frequency reference type used by the RCal module of the currently selected Cal Group

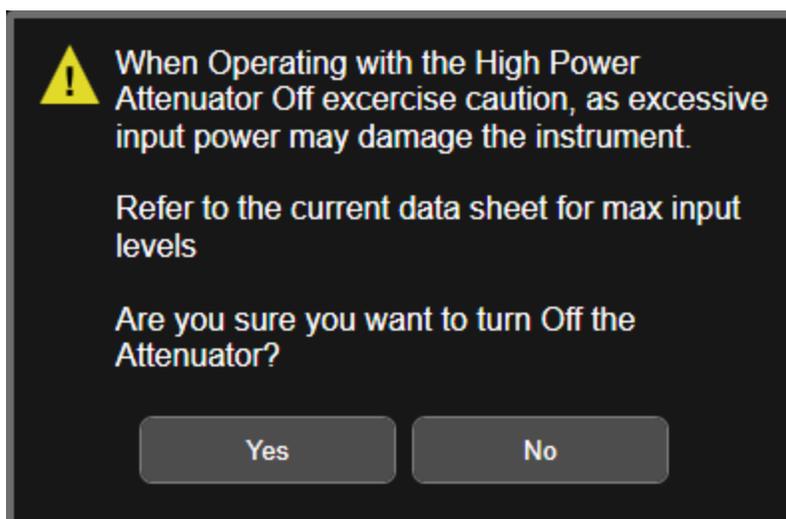

Remote Command	<code>:SYSTem:CALibration:TUNE:REFerence INTERNAL EXTernal</code> <code>:SYSTem:CALibration:TUNE:REFerence?</code>
Example	<code>:SYSTem:CALibration:TUNE:REFerence INTERNAL</code> Sets the calibrator frequency reference to Internal
Dependencies	Only displayed when an RCal module is the selected calibrator
Preset	Unaffected by Mode Preset . Set to preset value by Restore Input/Output Defaults or Restore System Defaults->All
Range	<code>INTERNAL EXTernal</code>

6.11 Advanced

Controls whether additional attenuation is added at the T/R Port. The T/R port has two input paths, one that provides a 16 dB attenuator, and the other that bypasses this attenuator.

- When this control is **ON**, the path includes the 16 dB attenuator, so the max input level for this path is +47 dBm (50 W)
- When this control is **OFF**, the 16 dB attenuator is bypassed, so the max input level for this path is +33 dBm (2 W)

If the attenuator is turned off, the following warning message is displayed and confirmation that the attenuator is to be turned off is required;

Whenever the attenuator is bypassed (**OFF**), a warning appears in the status bar: "Input caution; T/R unprotected"

In the case of an input overload at the T/R input, (>2 W with Attenuator off, or >50 W with attenuator on), or an over-temperature at the T/R input, the input is disconnected, and a dialog is displayed, stating:

"CAUTION! Excessive power has been detected at the T/R Port. The input has been disconnected. Remove the high signal power and press OK"

Or:

"CAUTION! Over temperature has been detected at the T/R Port. The input has been disconnected. Remove the signal, allow to cool & press OK"

Until you press **OK**, the input remains disconnected, and no measurement can be made.

6 Input/Output
6.11 Advanced

Remote Command	<code>[:SENSe]:FEED:RF:PORT:TR:HPOWer:ATTenuator[:STATe] ON OFF</code> <code>[:SENSe]:FEED:RF:PORT:TR:HPOWer:ATTenuator[:STATe]?</code>
Example	<code>:FEED:RF:PORT:TR:HPOW:ATT ON</code> <code>:FEED:RF:PORT:TR:HPOW:ATT?</code>
Dependencies	Only appears in modular analyzers, and only when the M9470A module is installed, such as in M8920A. Option HDX is required to enable the T/R port
Preset	<code>ON</code>
State Saved	Saved in instrument state

6.12 Aux I/O Control

This menu is only available with Option LSN, indicating that the LISN IO board is installed. It is used to control each of the eight control lines out of the rear panel connector independently. There are eight bits of control lines. The LISN Control (Mode setup) of the EMI Receiver application affects the AUX I/O Control settings. Whenever you change the LISN Control in Mode Setup, the corresponding AUX I/O Control data lines will also be changed. The selection at the AUX I/O Control, will not affect the LISN Control (Mode Setup) setting.

6.12.1 Data 0 – Data 7

Sets the value for Data 0 through Data 7 respectively.

Remote Command	<code>:OUTPut:AUX:IO:DATA<n> OFF ON 0 1</code> where <n> in an integer 0 - 7
Example	<code>:OUTPut:AUX:IO:DATA0 OFF</code>
Notes	The current value is persistent upon Mode Preset , but Input/Output Preset presets the value to ON for all 8 data lines
Preset	ON
Range	OFF ON

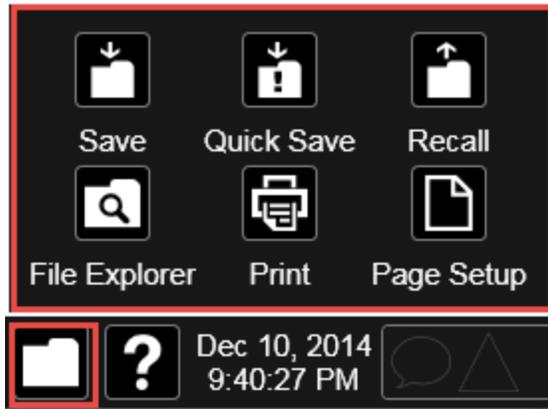

6.12.2 Aux IO Control (Remote Command Only)

Sets/Queries the value for all 8 data lines.

Remote Command	<code>:OUTPut:AUX:IO <Value></code> <code>:OUTPut:AUX:IO?</code>
Example	<code>:OUTPut:AUX:IO 31</code>
Notes	The current value is persistent upon Mode Preset , but Input/Output Preset presets the value to ON for all 8 data lines
Couplings	The states of Data 0 to Data 7 under the AUX I/O Control panel (Input/Output menu) change according to the keyed-in AUX IO value
Preset	31
Min	0
Max	255
Backwards Compatibility SCPI	<code>:OUTPut:UPORt <Value></code>

7 Save/Recall/Print

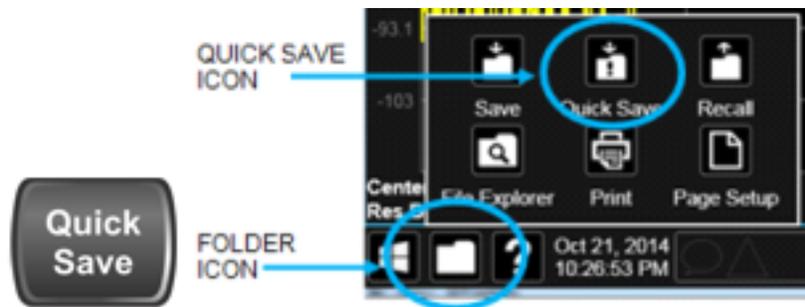

This section describes the functions that can be accessed via the front panel **Save**, **Quick Save**, and **Recall** hardkeys, as well as via the controls in the front-panel folder icon, as shown below.

7.1 Quick Save

Quick Save repeats the previous Save at the touch of a single button. Whatever you saved before gets saved again to the same directory, and with a filename derived from the previous filename.

You access Quick Save by pressing the **Quick Save** hardkey, or by pressing the folder icon at the bottom of the display and then pressing the **Quick Save** icon. In addition, if you have a PC keyboard plugged in, the sequence **CTL-Q** will perform a Quick Save.

The **Quick Save** front-panel key repeats the most recent save that was performed from the **Save** menu, with the following exceptions:

- Register saves are not remembered as Saves for the purpose of the Quick Save function
- If the current measurement does not support the last non-register save that was performed, an informational message is generated, “File type not supported for this measurement”

Quick Save repeats the last type of qualified save (that is, a save qualified by the above criteria) in the last save directory by creating a unique filename using the Auto File Naming algorithm described below.

If the previous save was a Screen Image save, Quick Save saves a Screen Image when the Quick Save button is pressed. This image is *exactly* what is on the screen when the **Quick Save** button is pressed. Quick Save does *not* force a dialog exit or navigate in any way, it simply snaps the image on the screen and saves it. This lets you save images of dialogs and setup screens that would be impossible to save using the **Save** dialog.

NOTE

When **Quick Save** is pressed the display theme changes to the theme specified by the **Screen Image Theme** control in order to take the screen shot, and then changes back to the Display Theme, but no navigation is performed and no dialogs are exited.

If **Quick Save** is pressed after startup and before any qualified Save has been performed, the Quick Save function performs a Screen Image save using the current settings for Screen Image saves (current theme, current directory), which then becomes the “last save” for the purpose of subsequent Quick Saves.

The Auto File Naming feature automatically generates a file name for use when saving a file. The filename consists of a prefix and suffix separated by a dot, as is standard for the Windows file system. A default prefix exists for each of the available file types:

Type	Default Prefix	Menu
State	State_	(Save/Recall)
Trace + State	State_	(Save/Recall)
Screen	Screen_	(Save/Recall)
Amplitude Corrections	Ampcor_	(Import/Export)
Traces	Trace_	(Import/Export)
Limit Lines	Limit_	(Import/Export)
Measurement Result	MeasR_	(Import/Export)
Capture Buffer	CapBuf_	(Import/Export)

A four digit number is appended to the prefix to create a unique file name. The numbering sequence starts at 0000 within each Mode for each file type and updates incrementally to 9999, then wraps to 0000 again. It remembers where it was through a Mode Preset and when leaving and returning to the Mode. It is reset by Restore Misc Defaults and Restore System Defaults and subsequent running of the instrument application. So, for example, the first auto file name generated for State files is **State_0000.state**. The next is **State_0001**, and so forth.

One of the key features of Auto File Name is that we guarantee that the Auto File Name will never conflict with an existing file. The algorithm looks for the next available number. If it gets to 9999, then it looks for holes. If it find no holes, that is no more numbers are available, it gives an error.

For example, if when we get to State_0010.state there is already a State_0010.state file in the current directory, it advances the counter to State_0011.state to ensure that no conflict will exist (and then it verifies that State_0011.state also does not exist in the current directory and advances again if it does, and so forth).

If you enter a file name for a given file type, then the prefix becomes the filename you entered instead of the default prefix, followed by an underscore. The last four letters (the suffix) are the 4-digit number.

For example, if you save a measurement results file as “**fred.csv**”, then the next auto file name chosen for a measurement results save will be **fred_0000.csv**.

NOTE

Although 0000 is used in the example above, the number that is used is actually the current number in the Meas Results sequence, that is, the number that would have

been used if you had not entered your own file name.

NOTE

If the filename you entered ends with _dddd, where d=any digit, making it look just like an auto file name, then the next auto file name picks up where you left off with the suffix being dddd + 1.

Quick Save Mode

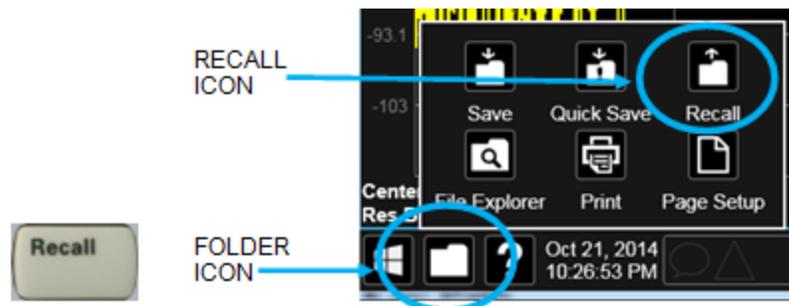

Quick Save can be operated in the Normal mode and in a special “Prompt” mode. There is a switch on the User Interface page of the **System** menus that lets you control this.

When Quick Save Mode is in Normal (the default setting), the instrument does an immediate save of a new file of the same type and to the same directory as the previous Save action. When Quick Save Mode is in the Prompt state, instead of immediately performing a Save, the Alpha Keyboard pops up with the proposed auto-filename in the entry area. The user can then press Enter to accept the auto filename, or edit the name and press Enter. This allows you to easily save a file with a custom file name.

Notes No remote command for this key specifically

7.2 Recall

The **Recall** dialog lets you recall previously saved states, traces and other items to the instrument from files on the instrument's internal storage, from removable devices, and from directories on the network. You access the Recall dialog by pressing the **Recall** hardkey, or by pressing the folder icon at the bottom of the display and then pressing the **Recall** icon.

The dialog has section tabs running down the left side, which you use to specify what you want to recall, similar to the **Save** dialog. You choose the recall item and then complete the recall by choosing a register or file location from which to recall the item.

Notes No remote command for this key specifically, but `:MMEM:LOAD` is available for specific file types. For example: `:MMEM:LOAD:STATE <filename>`
If you try to recall a State file for a mode that is not licensed or not available in the instrument, an error message will occur and the state will not change

Backwards Compatibility Notes In legacy analyzers, it was possible to load a state without affecting the trace data, limit lines or correction data. Similarly (since User Preset is actually loading a state), it was possible to do a User Preset without affecting the trace data, limit lines or correction data

In the X-Series, "state" always includes all of this data; so whenever state is loaded, all of the traces, limit lines and corrections are affected. Although this differs from previous behavior, it is desirable behavior, and should not cause adverse issues for users

Recall for the X-Series supports backward compatibility in the sense that you can recall a state file from any X-Series model number and any version of X-Series software. This is only possible if part of the recalling process goes through a limiting step after recalling the mode settings, at least for settings that may vary with version number, model number, option and license differences. If you try to recall a state file onto an instrument with less capability than what was available on the instrument during the save, the recall will ignore the state it doesn't support and it will limit the recalled setting to what it allows

Example: if the saved state includes preamp ON, but the recalling instrument does not have a preamp; the preamp is limited to OFF. Conversely, if you save a state without a preamp, the preamp is OFF in the state file. When this saved file is recalled on an instrument with a licensed preamp, the preamp is changed to OFF. Another example is if the saved state has center frequency set to 20 GHz, but the instrument recalling the saved state is a different model and only supports 13.5 GHz. In this case, the

center frequency is limited along with any other frequency based settings. Since the center frequency can't be preserved in this case, the recall limiting tries to at least preserve span to keep the measurement setup as intact as possible

Note that there is no state file compatibility outside of the X-Series. For example, you cannot recall a state file from ESA or PSA

7.2.1 Recall From File / Open

For every Recall type, a button appears called **Recall From File** or **Open**. “Recall From File” appears for recall types that also include registers (like State and Trace+State), and “Open” appears for all other recall types.

When you push the “Recall From File” or “Open” button, a dialog slides in from the right which allows you to see what files are saved in the current directory. See the “Save to File/Save As” section (3.1) for a depiction of this screen for the Save menu, which is similar to Recall.

The default directory is the internal directory for the current Mode and save type, on the D: drive. You may also change to another Mode's state directory by pressing the dropdown in the upper right corner labeled “Mode”. Once you have chosen a directory, the files in that directory whose extension matches the current data type (e.g., .state or .trace) are displayed in the right hand window of the dialog. You can sort this list by name, date, file size or extension by tapping the Name, Date, Size, or Content header at the top of each column. A second tap toggles the sort order between Ascending and Descending.

Also displayed is a path depiction showing the path to the current directory. In the example shown, the path is D:\Users\Instrument\Documents\SA\screen. Tapping any element of this path lets you select an alternate route. Tapping the “Computer” arrow lets you select a different drive.

Tapping the “back” arrow navigates to the previously selected directory.

If you plug in a removable drive (e.g., a thumb drive), the browser immediately navigates to the root of that drive. Furthermore, if you had a thumb drive in and you were in a directory on the thumb, and then you exit the browser, when you come back in you are still in the same directory on that removable drive. If you remove the thumb drive, you return to the directory you had been in before the thumb drive was plugged in.

Note that for each data type there is a “current” directory and it is the last directory used by either Save or Recall for that Mode. For example if in SA Mode you save a Corrections file to a particular directory, then when you go to recall a Correction in SA Mode, you should be pointing at that directory. Or if in EMC Mode you recall a Limit from a particular directory then when in EMC Mode you go to save a Limit, it

should be pointing at that same directory. There is one “current” directory for each data type for each Mode (not one for Save and one for Recall).

The Filename field, just below the Path field, shows the filename that will be used. The **File Name** field is loaded with the name of the selected file. You may edit the filename by tapping it, which brings up the onscreen alpha keyboard. Press the “Done” button on this keyboard when you are done editing.

Select a file to load and press Recall. After a successful recall, a message "File <filename> recalled" or "State Register <register number> recalled" is displayed in an info box for a few seconds.

The **Files of Type** field shows the file suffix for the type of file you have selected to recall. This field only appears for files which have multiple file types that can be recalled. These file types are:

Amplitude Corrections:

- Amplitude Corrections (*.csv)
- Legacy Cable Corrections (*.cbl)
- Legacy User Corrections (*.amp)
- Legacy Other Corrections (*.oth)
- Legacy Antenna Corrections (*.ant)

Limits:

- Limit Data (*.csv)
- Legacy Limit Data (*.lim)

7.2.2 State

Lets you choose a register or file from which to recall the state.

See the Save State description for information on state files and their contents and the default paths. State files have the extension “.state”.

For rapid recall, the State menu lists 16 registers from which you can recall states. Pressing a Register button initiates the recall. You can also select a file from which to recall by pressing “Recall From File”.

Since each state file is only for one Mode, the settings for other Modes are unaffected when it is loaded. Recall State will cause a mode switch if the state being recalled is not from the current active mode.

NOTE

In products that run multiple simultaneous instances of the X-Series Application, all instances share the same registers and file directories, so make sure you know from what instance a file or register was saved before recalling it.

Remote Command :MMEMory:LOAD:STATe <filename>

Example :MMEM:LOAD:STAT "MyStateFile.state"

This loads the state file data (on the default file directory path) into the instrument state

Notes When you pick a file to recall, the instrument first verifies that the file is recallable in the current instrument by checking the software version and model number of the instrument. If there is a mismatch between the file and the instrument, the recall function tries to recall as much as possible. It may limit settings that differ based on model number, licensing or version number. In general, variables in the instrument which are not contained in the state file will be unaffected, and variables in the state file which are not contained in the instrument will be ignored

The recall proceeds by aborting the currently running measurement, clearing any pending operations, and then loading the State from the saved state file. You can open state files from any Mode, so recalling a State file switches to the Mode that was active when the save occurred. After switching to the Mode of the saved state file, Mode settings and data (if any for the Mode) become those from the saved file. The active measurement becomes the measurement which was running when the state file was saved and the data relevant to the measurement (if there is any) is recalled

After recalling the state, the Recall State function does the following:

- Clears the input and output buffers
- Status Byte is set to 0
- Executes *CLS If the file specified is empty an error is generated. If the specified file does not exist, another error is generated. If there is a mismatch between the file and the proper file type, an error is generated. If there is a mismatch between file version or model number or instrument version or model number, a warning is displayed. Then it returns to the State menu and File Open dialog goes away

After the Recall, the instrument exits the Recall menu and returns to the previous menu

Backwards Compatibility SCPI :MMEMory:LOAD:STATe 1,<filename>

For backwards compatibility, the above syntax is supported. The "1" is simply ignored

7.2.2.1 Recall Type

If you have a built-in Source in your instrument, you may wish, when recalling State, to recall only the part of the State file that applies to the instrument, and leave the Source unaffected. Or you may wish to recall only the part of the State file that applies to the Source, and leave the instrument unaffected.

Lets you choose whether you wish to recall the entire Analyzer + Source state (**ALL**), just the Analyzer State (**ANALyzer**), or just the Source State (**SOURce**).

Remote Command	:MMEMory:LOAD:RTYPE ALL ANALyzer SOURce
Example	:MMEM:LOAD:RTYP ALL
Dependencies	This control is only available in models with a built-in source, such as VXT models
Preset	ALL
Range	ALL ANALyzer SOURce

7.2.2.2 Register 1 thru Register 16

Selecting any one of these register buttons causes the State to be recalled from the specified Register. The registers are provided for rapid saving and recalling, since you do not need to specify a filename or navigate to a file. Each of the register menu keys annotates whether it is empty or at what date and time it was last modified. In addition, you can edit any of the register names to enter custom names for any register.

Although these 16 registers are the only registers available from the front panel, there are 128 state registers available in the instrument. Registers 17-128 are only available from the SCPI interface, using the ***RCL** command.

There is one set of 128 state registers in the instrument, not one set for each Mode. When a state is saved, the Mode it was saved from is saved with it; then when it is recalled, the instrument switches to that Mode.

NOTE

In products that run multiple simultaneous instances of the X-Series Application, all instances share the same registers and file directories, so make sure you know from what instance a file or register was saved before recalling it.

The date displayed follows the format specified in the **Date Format** setting in the Control Panel. The time shows hours and minutes.

After the recall completes, the message "Register <register number> recalled" is displayed.

If you are in the Spectrum Analyzer Mode, and you are recalling a register that was saved in the Spectrum Analyzer Mode, then after the recall, you will still be in the Recall Register menu. If the Recall causes you to switch modes, then after the Recall, you will be in the Frequency menu.

If a requested register is empty an error is generated.

Example	*RCL 1
Range	1-16 from front panel, 1-128 from SCPI

7.2.2.3 Edit Register Names

You may enter a custom name on any of the Register keys, to help you remember what you are using that state to recall. To do this, press the **Name** field for the register you want to rename, which brings up the onscreen alpha keyboard. Press the “Done” button on this keyboard when you are done editing.

The maximum number of characters for a register name is 30. If you delete all the characters in the custom name, it restores the default (time and date).

For more information and the SCPI command, see Edit Register Names under the **Save, State** function.

7.2.3 Trace+State

Lets you choose a register or file for recalling the state.

See the Save State description for information on state files and their contents and the default paths. State files have the extension “.state”.

For rapid recall, the Trace+State menu lists 16 registers from which you can recall trace+state files. Pressing a Register button initiates the recall. You can also select a file from which to recall by pressing “Recall From File”.

Since each trace+state file is only for one Mode, the settings for other Modes are unaffected when it is loaded. **Recall Trace+State** will cause a mode switch if the trace+state being recalled is not from the current active mode.

NOTE

In products that run multiple simultaneous instances of the X-Series Application, all instances share the same registers and file directories, so make sure you know from what instance a file or register was saved before recalling it.

Trace+State files have the extension **.trace**.

The Trace+State selection only appears for measurements that support trace saves. It is blanked for modes that do not support trace saves. Saving **Trace** is identical to saving State except a .trace extension is used on the file instead of .state, and internal flags are set in the file indicating which trace was saved.

Remote Command	:MMEMory:LOAD:TRACe TRACE1 ... TRACE6,<filename>
Example	:MMEM:LOAD:TRAC TRACE2,"MyTraceFile.trace"

This loads the trace file data (on the default file directory path) into the specified trace; if it is a "single trace" save file, that trace is loaded to trace 2, and is set to be not updating

:MMEM:LOAD:TRAC:REG TRACE1,2

restores the trace data in register 2 to Trace 1

Notes

When you perform the recall, the recalling Trace function must first verify the file is recallable in this instrument by checking instrument software version and model number, since it includes State. If everything matches, a full recall proceeds by aborting the currently running measurement, and loading the state from the saved state file to as close as possible to the context in which the save occurred. You can open .trace files from any mode that supports them, so recalling a Trace file switches to the mode that was active when the save occurred. After switching to the mode of the saved state file, mode settings and data (if any for the mode) are loaded with values from the saved file and the saved measurement of the mode becomes the newly active measurement, and the data relevant to the measurement (if there is any) is recalled

Once the state is loaded, the trace data must be loaded. The internal flags are consulted to see which trace to load and the "To Trace" setting to see where to load it. Trace data is always loaded with the specified trace set to View, so that the data is visible and not updating (so as not to erase the recalled data). If the file is an "all trace" file, all traces are loaded with the saved data (to the original trace the data was saved from) and set to View. Traces whose data is not loaded are restored to the update state that existed when they were saved

After the Recall the instrument exits the Recall menu and returns to the previous menu

Some modes and measurements do not have available all 6 traces. Phase Noise mode command, for example, is: `:MMEMory:LOAD:TRACe TRACE1|TRACE2|TRACE3,<filename>`

Some modes and measurements have more than 6 traces available. The Realtime SA mode command, for example, is: `:MMEMory:STORe:TRACe TRACE1 | TRACE2 | TRACE3 | TRACE4 | TRACE5 | TRACE6 | TRACE7 | TRACE8 | TRACE9 | TRACE10 | TRACE11 | TRACE12 | ALL,<filename>`

7.2.3.1 Recall To Trace

Lets you select which Trace to recall to. Not all Modes have the same number of traces available. The default is the currently selected trace, selected in this or any other menu with **Trace** selection. If you have selected **ALL**, then that remains selected until you specifically change it to a single trace, regardless of the trace selected in the **Trace** menu.

If the `.trace` file is an "all trace" type, "**To Trace**" is ignored, and the traces each go back to the trace from which they were saved.

7.2.3.2 Register 1 thru Register 16

Selecting any one of these register buttons causes the specified trace(s) and the state of the currently active mode to be recalled from the specified Register. The registers are provided for rapid saving and recalling, since you do not need to specify a filename or navigate to a file. Each of the register menu keys annotates whether it is empty or at what date and time it was last modified. In addition, you can edit any of the register names to enter custom names for any register.

7 Save/Recall/Print
7.2 Recall

There is one set of 16 trace+state registers in the instrument, not one set for each Mode. When trace+state is saved, the Mode it was saved from is saved with it; then when it is recalled, the instrument switches to that Mode.

NOTE

In products that run multiple simultaneous instances of the X-Series Application, all instances share the same registers and file directories, so make sure you know from what instance a file or register was saved before recalling it.

The date displayed follows the format specified in the **Date Format** setting under the Control Panel. The time shows hours and minutes.

After the recall completes, the message "Register <register number> recalled" is displayed. If a requested register is empty an error is generated.

Recalling state from a Register is the same as recalling state from a Trace+State File.

Example	<code>*RCL 1</code>
Range	1-16

7.2.3.3 Edit Register Names

You may enter a custom name on any of the Register keys, to help you remember what you are using that state to recall. To do this, press the **Name** field for the register you want to rename, which brings up the onscreen alpha keyboard. Press the "Done" button on this keyboard when you are done editing

The maximum number of characters for a register name is 30. If you delete all the characters in the custom name, it restores the default (time and date).

For more information and the SCPI command, see Edit Register Names under the **Save, State** function.

7.2.4 Screen Config + State

Lets you load the complete configuration of all your screens from a file which you specify.

Note that recalling a screen config file will wipe out your current screen configuration; you don't get a warning before it loads but there is a note on the Recall page letting you know what is going to happen.

The filenames are of the form:

`State_0001.screen`

Remote	<code>:MMEMory:LOAD:SCONfig <filename></code>
--------	---

Command	
Example	<code>:MME:LOAD:SCON "myScreenConfig.screen"</code> This loads the screen configuration from the file <code>MyScreenConfig.screen</code> in the default directory

7.2.5 Measurement Data

Lets you specify a data type (for example, trace data) and choose a file from which to import the data.

Measurement Data files are Comma-Separated Value (CSV) files, and contain the requested data in a form that can be imported into Excel or other spreadsheets, as well as header data that gives information on relevant instrument settings at the time the save occurred.

For more on Measurement Data files, see "[Measurement Data](#)" on page 3223 under **Save**.

Since the commonly exported data files are in `.csv` format, you can edit the data prior to importing it. This allows you to export a data file, manipulate the data in Excel (for example) and then import it.

7.2.5.1 Data Type

Lets you select the data type to recall.

Notes	There is no SCPI command for Data Type, as the type is implied in the SCPI command for each item
Dependencies	The Data Type menu for any given measurement only contains data types that are supported by that measurement. Data Types which are not importable will not appear, even if they do appear in the corresponding Save menu

Trace

Allows you to import Trace files in the PC-readable `.csv` format.

Trace data files have the extension `.csv`. The trace file contains a "metadata" header which describes the state of the instrument when the file was saved. This metadata is compared to the current state of the instrument when the file is recalled; if it doesn't match the current state, the "invalid data indicator" (*) is displayed.

The metadata is detailed in Trace File Contents in the **Save** section.

Remote Command	<code>:MME:LOAD:TRAC:DATA TRACE1 ... TRACE6,<filename></code>
Example	<code>:MME:LOAD:TRAC DATA TRACE2,"myTrace2.csv"</code>

	Imports the 2nd trace from the file myTrace2.csv in the current path. For SA mode, the default path is My Documents\SA\data\traces
Dependencies	For SA measurements, a trace cannot be recalled from a trace file that was exported with ALL traces selected A trace cannot be imported if the number of trace points in the file do not match the number of sweep points currently set for the measurement. If this happens, an error message is generated Errors are reported if the file is empty or missing, or if the file type does not match, or if there is a mismatch between the file type and the destination data type
Couplings	When a trace is imported, Trace Update is always turned OFF for that trace and Trace Display is always turned ON
Annotation	After recall is complete, an advisory is displayed in the message bar confirming which trace file was loaded
Status Bits/OPC dependencies	Sequential - aborts the current measurement

7.2.6 Limit

Lets you choose a file from which to import the Limit data.

Limit files are **.csv** files, and contain the limit data in a form that can be imported into Excel or other spreadsheets, as well as header data that gives information on the limit.

See the **Save Limit** description ("**Limit**" on page 3229) for information on Limit files and their contents and the default paths. **Limit** files have the extension **.csv**.

For backwards compatibility, older limit files with the extension **.lim** can be read into the instrument, but you can only save limits as **.csv** files.

A set of preloaded Limits files can be found in the directory:

My Documents/EMC Limits and Ampcor/Limits

Remote Command	<code>:MMEMory:LOAD:LIMit LLINE1 LLINE2 LLINE3 LLINE4 LLINE5 LLINE6,<filename></code>
Example	<code>:MMEM:LOAD:LIM LLINE2,"myLimitLine2.csv"</code> Imports the 2nd Limit Line from the file myLimitLine2.csv in the current path
Dependencies	Errors are reported if the file is empty or missing, or if the file type does not match, or if there is a mismatch between the file type and the destination data type In the Log Plot measurement in Phase Noise Mode, there are only three Limit Lines, so the valid parameters are LLINE1 LLINE2 LLINE3 This key only appears if you have the proper option installed in your instrument
Couplings	When a limit line is loaded from mass storage, it is automatically turned on. This allows the user to see it, thus confirming the load. The Margin settings will match those when the limit was saved

	The instrument cannot mix Limits domains (X Axis Unit must be Frequency or Time for both Limits). So when a Limits file is loaded, the instrument will set the Limits domain (X Axis Unit) to match that of the file. If this changes the Limits domain from what it was before the file was loaded, all Limits data in all Limits sets will be erased before the data loads. If this operation is over the remote interface there will be no warning if this occurs, so care should be taken to know the domain of the file you are loading
Annotation	After recall is complete, an advisory is displayed in the message bar confirming which limit file was loaded
Status Bits/OPC dependencies	Sequential - aborts the current measurement

7.2.6.1 Select Limit

Selects the Limit register into which the recalled Limit will be placed, for example, Limit 1.

Preset	Not part of Preset , but is reset to LLINE1 by Restore Mode Defaults Survives shutdown
--------	---

7.2.7 Correction

Allows you to import Amplitude Corrections files in the PC-readable **.csv** format.

Amplitude Correction files are CSV files, and contain the correction data in a form that can be imported into Excel or other spreadsheets, as well as header data that gives information on the correction.

For backwards compatibility, older limit files with the extension **.amp**, **.cbl**, **.ant** and **.oth** can be read into the instrument.

A set of preloaded Corrections files can be found in the directory:

My Documents\EMC Limits and Ampcor\Ampcor

The default path for CSV files is:

My Documents\amplitudeCorrections

Antenna corrections are a particular kind of Amplitude Corrections – they are distinguished in the corrections file by having the Antenna Unit set to a value other than None. When the Amplitude Correction is an Antenna correction and the Antenna Unit in the file is not **None**, the Y-Axis Unit setting changes to match the Antenna (Transducer) Unit in the file.

Remote Command	:MMEMory:LOAD:CORRection 1 ... 8, <filename>
Example	:MMEM:LOAD:CORR 2, "myAmpcor.csv"

7 Save/Recall/Print
7.2 Recall

	recalls the Amplitude Correction data from the file myAmpcor.csv in the current directory to the 2nd Amplitude Correction table, and turns on Correction 2
Dependencies	<p>Only one Transducer units can be on at any given time. Note that this means that if a correction file with a Transducer Unit is loaded into a particular Correction, all other Corrections are set to that same Transducer unit</p> <p>Corrections are not supported by all Measurements. If in a Mode in which some Measurements support it, this key is grayed-out in measurements that do not. The key does not show at all if no measurements in the Mode support it</p> <p>Errors are reported if the file is empty or missing, or if the file type does not match, or if there is a mismatch between the file type and the destination data type</p> <p>This key does not appear unless you have the proper option installed in your instrument</p> <p>This command will generate an "Option not available" error unless you have the proper option installed in your instrument</p>
Couplings	When a correction file is loaded from mass storage, it is automatically turned on (CorrectionON) and Apply Corrections is set ON . This allows you to see its effect, thus confirming the load
Annotation	After recall is complete, an advisory is displayed in the message bar confirming which file was recalled
Backwards Compatibility SCPI	<p>:MMEMory:LOAD:CORRection ANTenna CABLe OTHer USER, <filename></p> <p>For backwards compatibility, ANTenna maps to 1, CABLe maps to 2, OTHer maps to 3 and USER maps to 4</p>

7.2.7.1 Select Correction

Selects the register into which the recalled Correction will be placed, for example, Correction 1.

Preset	Not part of a Preset , but is reset to Correction 1 by Restore Input/Output Defaults Survives a shutdown
--------	---

7.2.8 Complex Correction

Imports Complex Corrections files in the PC-readable **.s2p** format.

Complex Correction files contain amplitude and phase correction data in a form that can be imported into Excel or other spreadsheets, as well as header data that gives information on the correction.

The default path for Complex Corrections files is:

My Documents\complexCorrections

Remote Command	:MMEMory:LOAD:CCORrection <integer>, <filename>
Example	:MMEM:LOAD:CCOR 2, "mycor.s2p"

	recalls the Complex Correction data from the file mycor.s2p in the current directory to the 2nd Complex Correction table, and turns on Complex Correction 2
Dependencies	Complex Corrections are not supported by all Measurements. The tab does not show at all if no measurements in the Mode support it Errors are reported if the file is empty or missing, or if the file type does not match, or if there is a mismatch between the file type and the destination data type
Couplings	When a complex correction file is loaded from mass storage, it is automatically turned ON and Apply Corrections is set ON . This allows you to see its effect, thus confirming the load
Annotation	After recall is complete, an advisory is displayed in the message bar confirming which file was recalled

7.2.8.1 Select Complex Correction

Selects the register into which the recalled Complex Correction will be placed, for example, Complex Correction 1.

Preset	Not part of a Preset , but is reset to Correction 1 by Restore Input/Output Defaults Survives a shutdown
--------	---

7.2.9 Correction Group

Selects the Correction Group as the data type to be imported. The next step is to press **Recall From** to open the file dialog. When recalling a correction group, the correction group settings, range table and correction files data will be loaded.

If there are values defined in the correction group range, and you accessed this function from the front panel, there will be a message prompt that asks for your confirmation, because the values will be overwritten during the recall.

Remote Command	:MMEMory:LOAD:CORREction:GROup <filename>
Example	:MMEM:LOAD:CORR:GRO "D:\myCorrGroup.csv" Imports the Correction Group and the corresponding correction tables from the file myCorrGroup.csv
Notes	Errors are reported if the file is empty or missing, or if the file type does not match, or if there is a mismatch between the file type and the destination data type When recall is completed, the correction group will be turned ON. If any of the correction data loaded is found out of the frequency range, Execution error is generated. Error icon appears on the status column correction group table
Dependencies	This file type is supported in EMI Receiver Mode, and in Spectrum Analyzer Mode if option EMC or EMI Receiver mode is present
Annotation	After recall is complete, display an advisory in the message bar
Status Bits/OPC dependencies	Sequential - aborts the current measurement

7.2.10 SCPI Recorder

Contains controls to allow you to recall SCPI recordings.

7.2.10.1 Recall From File

Recalls a previously saved SCPI Recorder file. For details of the SCPI Recording feature, see "[SCPI Recorder](#)" on page 2825.

After the file contents have been read, each of the SCPI commands or queries present in the file at the time of recall is applied to the system. If the file is from another instrument, or from a different model, some commands may cause unexpected data changes as each is applied. If any commands result in errors, the command(s) and the corresponding error(s) are displayed after playback is completed.

NOTE

Some SCPI entries in the recorded file may require the presence of other files, if a command in the recorded file specifies the recall of other files.

7.2.11 Mask

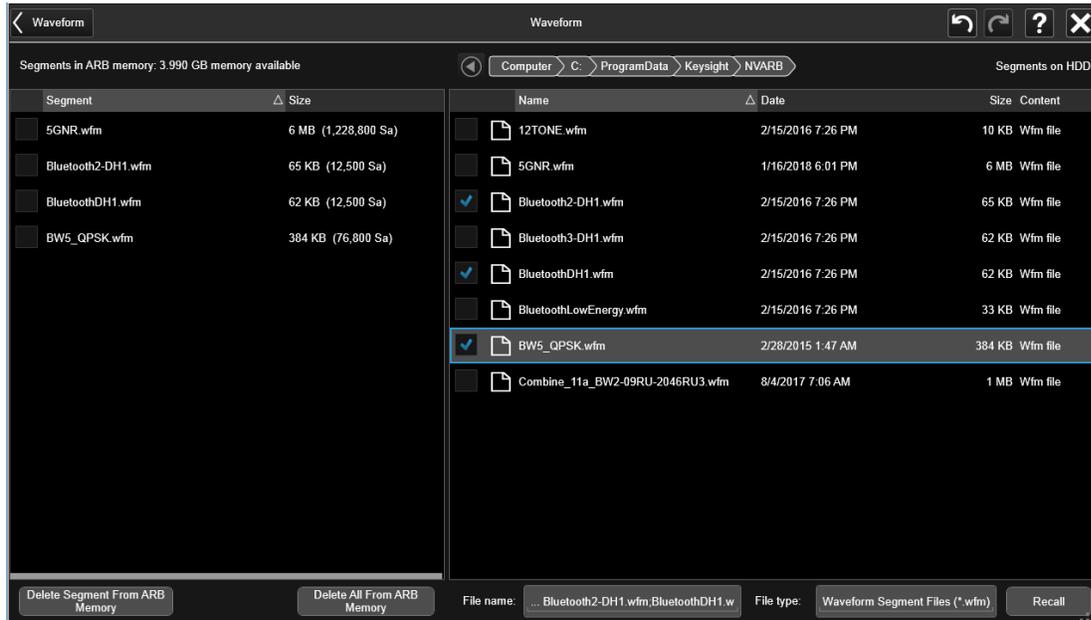

The **Mask** data type is used to import and export Mask files for measurements that use masks, such as cellular comms and real-time measurements.

7.2.12 Waveform

Recalls waveforms into the ARB memory of an Internal Source.

When you select the **Waveform** tab in the **Save** dialog,, a hint appears saying "Recalls files from Mass Storage to the ARB and lets you manage the ARB memory at the same time."

You then tap **Recall From File** to display the **Recall Waveform** dialog.

The left hand window shows the files in ARB memory. The right hand window shows the files on the hard drive.

You can select one or more waveform files in the right hand window. Each file selected has a blue check box in it. To select a single file, tap that file's row. To select additional files, tap the check box in the row of the desired additional files.

When you have selected the file or files that you wish to recall, tap Recall. The file (s) are recalled into the ARB memory, and appear in the left hand window.

If a file of the same name already exists within ARB memory, it is overwritten. If you wish to load two segments of the same name, you must rename one of the segments before loading it into ARB memory. To rename a segment, you can either use Windows File Explorer, or **:MMEMory: COPY**.

You can select one or more segments in the left hand window and tap "Delete Segments from ARB memory" to delete the selected files. You can also delete all files in ARB memory by tapping "Delete All from ARB memory".

You can change the current directory by tapping on an element of the file path at the top of the screen and selecting the desired subdirectory in the list that appears, and repeating until you have the path you want. The current directory is used for manually loading waveform segments into ARB memory for playback, and as a search location for waveform segments that are required to be loaded into ARB memory for playback of a waveform sequence or a list sequence.

File Type allows you to specify a waveform format. The available file types are listed below:

7 Save/Recall/Print

7.2 Recall

- Waveform Files - *.wfm. These are Keysight Signal Studio files
- Binary Files - *.bin. These are interleaved IQ data files. They could be single precision or double precision customer created files. One-byte marker may be added
- CSV Files - *.csv. This comma separated value file could be generated by Microsoft Excel
- Text Files - *.txt
- Matlab Files - *.mat. A *.mat waveform should be Level 4, Level 5 or HDF5 MAT-files (only Level 5 Matlab file is supported in X24)

Waveforms formatted in *.csv, *.txt and *.mat are supported by models with a built-in source, such as VXT and EXM.

*.txt files are formatted according to the following rules:

1. Text files only contain the IQ information. Data on the right column represents the amplitude of real(I) points, Data on the left column represents the amplitude of imaginary(Q) points
2. The amount of data should be multiple of two (IQ pairs)
3. The data range is from $-1e10$ to $1e10$, the data type should be int, float or double. 16 digits or fewer for every data is acceptable
4. The values are separated by comma or tab. Extra comma or tabs will be ignored
5. Use Enter to separate IQ pairs

Example for text file data:

```
0.46425922, -0.57411048
0.47184454, -0.58435995
0.48107329, -0.59014958
0.49223323, -0.58998679
0.50419607, -0.58558843
0.51679158, -0.57721768
0.53005322, -0.56481976
0.54373011, -0.54879346
0.55759183, -0.52950807
0.57141409, -0.50732489
```

Rules 1-3 above also apply to *.csv data.

7.2.12.1 Load Segment to ARB Memory

Loads a single segment to ARB memory. Same as pressing the **Recall** button with a single waveform selected.

Remote Command	<code>:SOURCE:RADio:ARB:LOAD <string></code>
Example	<code>:SOUR:RAD:ARB:LOAD "D:\NVARB\testwaveform.bin"</code> or <code>:SOUR:RAD:ARB:LOAD "NVWFM:testwaveform.bin"</code>
Notes	<p>Because loading the file involves a delay of unpredictable length, this command should be followed by *OPC?, which holds off subsequent commands until the loading operation is complete</p> <p><string> - specifies the path name of the file to load from the HDD into ARB memory. It could be a <full path + filename>, or <"NVWFM" MSUS + colon + filename></p> <p>If you specify a file over SCPI, but the file is not at the specified location, an error is generated. If you try to load a waveform file but the file contains less than 500 IQ samples, an error is generated</p> <p>VXT models SP900B/11A/15A/16A: If you try to load a waveform file but the file contains less than 1024 IQ samples, an error is generated</p> <p>If you try to load a Signal Studio waveform *.wfm which contains invalid waveform header, an error is generated</p> <p>If the ARB is ON when you load a file to ARB memory or delete a file from ARB memory, the playing waveform segment may not keep phase continuity during the ARB memory operation. The waveform will be replayed after the ARB operation is finished</p> <p>ARB can be loaded into ARB memory even if required licenses are not present on the instrument. In this case, a GUI only warning message -800, "Operation complete; Loaded <filename> successfully, but no license <required licenses> installed". User can install required licenses according to <required licenses> string to license it, or multi-pack license it</p> <p>Sequence Analyzer Mode: When in Sequence Analyzer mode, and Include Source is Yes, an attempt to load a file to ARB memory will be rejected with an error. When Include Source is No and if there is insufficient free ARB memory to load the selected waveform, an error is generated</p>
Remote Command	<code>:SOURCE:RADio:ARB:LOAD:ALL <string></code>
Example	<code>:SOUR:RAD:ARB:LOAD:ALL "D:\nvarb"</code>
Notes	<p>Loads all the segment files within the currently selected directory into ARB memory. If a file of the same name already exists within ARB memory, it is overwritten. If you wish to load two segments of the same name, you must rename one of the segments before loading it into ARB memory. To rename a segment, you can either use Windows File Explorer, or :MEMory:COPY</p> <p><string> specifies the directory on the HDD to load the files into ARB memory from</p> <p>If you specify a directory over SCPI, but the directory does not exist, an error is generated</p> <p>If the ARB is ON, and you then load or delete a file to ARB memory, the playing waveform segment may</p>

not keep phase continuity during the ARB memory operation. The waveform will be replayed after the ARB operation is finished

Sequence Analyzer Mode:

When in Sequence Analyzer mode, and Include Source is Yes, an attempt to load all files from a directory to ARB memory is rejected with an error. When Include Source is No and there is insufficient free ARB memory to load all the waveforms, when the ARB memory is full, the copy ceases, and an error is generated

7.2.12.2 Delete Segment From ARB Mem

Deletes a segment from ARB memory.

Remote Command	<code>:SOURCE:RADio:ARB:DELeTe <string></code>
Example	<code>:SOUR:RAD:ARB:DEL "testwaveform.bin"</code>
Notes	<p><code><string></code> specifies the waveform to be deleted from the ARB playback memory</p> <p>It is possible to delete files from within the ARB memory when the ARB is ON. However, if you attempt to delete the file that is currently playing an error is generated</p> <p>It is possible to delete a file from within the ARB memory when the sequencer state is ON and the file is not being used by the List Sequencer. If you attempt to delete a file which is being used by the list sequencer, an error is generated</p> <p>When the Sequencer state of the List Sequencer is On, even if ARB state is On, the selected waveform will not be played. In this case, if the selected waveform is not used in List Sequence, it can be deleted and the ARB state is turned Off</p> <p>If the ARB is ON and you load a file to ARB memory or delete a file from ARB memory, the playing waveform segment may not keep phase continuity during the ARB memory operation. The waveform will be replayed after the ARB operation is finished</p> <p>Sequence Analyzer Mode:</p> <p>When in Sequence Analyzer mode and Include Source is Yes, an attempt to delete a file from ARB memory is rejected with an error . When Include Source is No and you specify a file that does not exist within ARB memory, an error is generated</p>

7.2.12.3 Delete All From ARB Memory

Removes all segments from ARB memory.

Remote Command	<code>:SOURCE:RADio:ARB:DELeTe:ALL</code>
Example	<code>:SOUR:RAD:ARB:DELeTe:ALL</code>
Notes	<p>If you attempt to delete all files from ARB memory when there are waveform files used in the Sequencer function of the List Sequencer and the Sequencer state is ON, all files except the files currently being used in list sequencer are deleted, and an error is generated</p> <p>If the ARB is ON and you load a file to ARB memory or delete a file from ARB memory, the playing</p>

waveform segment may not keep phase continuity during the ARB memory operation. The waveform will be replayed after the ARB operation is finished

Sequence Analyzer mode:

When in Sequence Analyzer mode and Include Source is Yes, an attempt to delete all files from ARB memory is rejected with an error. When Include Source is No and you attempt to delete all files from ARB memory when the ARB is currently playing a file, all files except the one playing are deleted and an error is generated

7.2.12.4 Set Default Directory (Remote Command Only)

Sets the default directory for loading ARB files from SCPI.

Remote Command	<code>:SOURce:RADio:ARB:DEFault:DIRectory <string></code> <code>:SOURce:RADio:ARB: DEFault:DIRectory?</code>
Example	<code>:SOUR:RAD:ARB:DEF:DIR "D:\ArbFiles"</code> <code>:SOUR:RAD:ARB:DEF:DIR?</code>
Notes	Sets the default directory to be used as a search location for waveform segments that are required to be loaded into ARB memory for playback of a waveform sequence, and as a search location for selecting waveforms using SCPI
State Saved	Persistent, survives a power cycle and a preset but not saved in the instrument state

7.2.12.5 Query ARB Memory File List (Remote Command Only)

Queries the instrument for the list of waveform segments in the ARB memory.

NOTE

This query returns a string for waveform segment names in ARB memory. If you want a string list of waveform segments in the ARB memory, use **"Query ARB Memory Full File List (Remote Command Only)"** on page 3206.

Remote Command	<code>:SOURce:RADio:ARB:CATalog?</code>						
Example	<code>:SOUR:RAD:ARB:CATalog?</code>						
Notes	The return data is in the following format: <table border="1" data-bbox="389 1512 1396 1659"> <tr> <td><code><integer></code></td> <td>memory used</td> </tr> <tr> <td><code><integer></code></td> <td>memory free</td> </tr> <tr> <td><code><string>...</code></td> <td>comma separated list of waveform segments within ARB memory</td> </tr> </table>	<code><integer></code>	memory used	<code><integer></code>	memory free	<code><string>...</code>	comma separated list of waveform segments within ARB memory
<code><integer></code>	memory used						
<code><integer></code>	memory free						
<code><string>...</code>	comma separated list of waveform segments within ARB memory						

7.2.12.6 Query ARB Memory Full File List (Remote Command Only)

Queries the instrument for the string list of waveform segments in the ARB memory. It returns a string list for waveform segment names in the ARB memory.

7 Save/Recall/Print
7.2 Recall

Remote Command	<code>:SOURce:RADio:ARB:FCATalog?</code>								
Example	<code>:SOUR:RAD:ARB:FCATalog?</code>								
Notes	<p>The return data is in the following format:</p> <table border="1"> <tr> <td><code><integer></code></td> <td>Memory used</td> </tr> <tr> <td><code><integer></code></td> <td>Memory free</td> </tr> <tr> <td><code><integer></code></td> <td>File count in ARB memory</td> </tr> <tr> <td><code><string>,<string>, ... <string></code></td> <td>Comma-separated string list of waveform segments within ARB memory</td> </tr> </table> <p>Example: <code>:SOUR:RAD:ARB:FCAT?</code></p> <p>EXT returns: 27499,2069653,3,"c2k.wfm","gsm.wfm","wcdma.wfm"</p>	<code><integer></code>	Memory used	<code><integer></code>	Memory free	<code><integer></code>	File count in ARB memory	<code><string>,<string>, ... <string></code>	Comma-separated string list of waveform segments within ARB memory
<code><integer></code>	Memory used								
<code><integer></code>	Memory free								
<code><integer></code>	File count in ARB memory								
<code><string>,<string>, ... <string></code>	Comma-separated string list of waveform segments within ARB memory								

7.2.13 Power Sensor Cal Factor

Loads the calibration factor information from a file to the calibration factor editor. When accessed via the front panel, the file type should be set to Calibration first. If necessary, the directory and the file name can also be set.

Lets you select a file from which to import the Power Sensor Cal Factor data.

Cal Factor files are XML files, and contain the power sensor cal factor data and header data that gives information on the power sensor.

Cal Factor files have the extension `.xml`. The default path for Cal Factor files is:

`My Documents\MRECEIVE\data\PSCF`

Remote Command	<code>:MMEMory:LOAD:PSCFactor <file_name></code>
Example	<code>:MMEMory:LOAD:PSCF "PSCF0001.XML"</code>
	Imports the cal factor from the file <code>PSCF0001.xml</code> in the current path
Dependencies	<p>This function only appears in the Measuring Receiver measurement application</p> <p>Errors are reported if the file is empty or missing, or if the file type does not match, or if there is a mismatch between the file type and the destination data type</p>
Annotation	After recall is complete, an advisory is displayed in the message bar confirming which power sensor cal factor file was loaded

7.2.14 Recording

Lets you specify a data type (for example, I/Q data) and select a file from which to import the data, then the data can be routed to the measurement engine as though it were being acquired from the Input.

The Recording and Playback of signal data files is a multi-step process that involves controls in several menus.

The menus that are involved in Record/Playback are:

- **Save**, "**Recording**" on page 3241 (under the **Save** hardkey or the **Save** icon in the **File** panel)
- **Recall**, **Recording** (this menu)
- **Sweep**, **Recording** tab
- **Sweep**, **Playback** tab
- **Input/Output**, "**Data Source**" on page 3063 tab

NOTE

A complete tutorial for the Record/Playback functionality, including how to load and save Recording files, can be found under the **Data Source** tab in **Input/Output**.

Dependencies	Only available in the following modes and measurements: <ul style="list-style-type: none">– VMA (Digital Demod and Custom OFDM)– 5G NR (Modulation Analysis)– LTE (Modulation Analysis)– WLAN (Modulation Analysis, MIMO Modulation Analysis, Spectral Flatness)– Analog Demod– Bluetooth (Transmit Analysis)– IoT & SRComms (LoRa CSS Demod)
--------------	---

7.2.14.1 Data Type

Allows you to recall IQ data from the measurement using a specified file type (CSV, SDF, TXT, BIN, BINX, BINF, ORB). See "**Recording**" on page 3241 for details about the available file types.

Note that **BIN**, **BINX** and **BINF** files do not include sampling rate information inside the file, so after recalling one of these file types you will need to set the Sample Rate in **Sweep, Playback.**, based on your note of the Sample Rate that was displayed on the **Sweep, Recording** menu panel when you saved the file.

Example	<code>:MMEM:LOAD:RECORDing "C:\TEMP\MyIQData.csv"</code>
---------	--

7.2.14.2 Channel

Select data channels to recall. This is only supported in the 5G NR EVM, VMA Digital Demod, VMA Custom OFDM and WLAN MIMO EVM measurements.

The `<meas>` param in the command must be replaced with the node of the active measurement:

- `EVM` for 5G NR EVM
- `EVMM` for WLAN MIMO EVM
- `DDEM` for VMA Digital Demod
- `OFDM` for VMA Custom OFDM

Remote Command	<code>:MMEMory:LOAD:<meas>:RECOding:CHANnel ALL CH1 CH2 CH3 CH4 CH5 CH6 CH7 CH8</code> <code>:MMEMory:LOAD:<meas>:RECOding:CHANnel?</code>
Example	<code>:MMEM:LOAD:EVM:REC:CHAN CH1</code> <code>:MMEM:LOAD:EVM:REC:CHAN?</code>
Preset	<code>ALL</code>
State Saved	No
Range	<code>ALL CH1 CH2 CH3 CH4 CH5 CH6 CH7 CH8</code>

7.2.14.3 Reset

Clears all recalled data channels.

This is only supported by 5G NR EVM, VMA Digital Demod, VMA Custom OFDM and WLAN MIMO EVM measurements.

The `<meas>` param in the command must be replaced with the node of the active measurement:

- `EVM` for 5G NR EVM
- `EVMM` for WLAN MIMO EVM
- `DDEM` for VMA Digital Demod
- `OFDM` for VMA Custom OFDM

Remote Command	<code>:MMEMory:LOAD:<meas>:RECOding:RESet</code>
Example	<code>:MMEM:LOAD:EVM:REC:RES</code>

7.2.14.4 Recalled data channel table (Display only)

Displays recalled IQ data file for each channel in a table.

7.2.15 Recording + State

Recalls a snapshot file (*.rssf) that includes state and IQ recording.

Remote Command	:MMEMory:LOAD:RState <filename>
Example	:MMEM:LOAD:RST "snapshot1.rssf"
Status Bits/OPC dependencies	Sequential - aborts the current measurement

7.2.16 Component Carrier Setup

Recalls the whole Component Carrier setup or Custom IQ constellation definition.

Dependencies	Only appears in the 5GNR EVM measurements in 5GNR Mode
--------------	--

7.2.16.1 CC Setup

You can recall a Component Carrier Setup file, which sets up the 5G NR Modulation Analysis measurement with the settings in the file.

Using the Component Carrier dropdown, you can specify which component carrier you wish to apply this setup to, or **ALL**.

The following file formats are supported:

- Signal Studio N7631C Setup Files (*.scp)
- M9384B VXG 5GNR Setup Files (*.sgen)
- PWSG Desktop Setup Files (*.pwsq)
- 89600 VSA 5GNR Setup Files (*.setx)
- X-Series Measurement Application 5GNR Component Carrier Setup Files (*.nrcc)

Remote Command	:MMEMory:LOAD:EVM:SETup ALL CC0 CC1 CC2 CC3 CC4 CC5 CC6 CC7 CC8 CC9 CC10 CC11 CC12 CC13 CC14 CC15,<string>
Example	:MMEM:LOAD:EVM:SET CC0,"mySetup.scp"

Status Bits/OPC dependencies Sequential - aborts the current measurement

Frame Index (.scp and .pwsq only)

Signal Studio (N7631C) and PWSG desktop may have configuration for multiple frames. This parameter specifies which frame's configuration will be recalled in 5GNR Modulation Analysis measurement from a **.scp** or **.pwsq** file.

Remote Command	<code>:MMEMory:LOAD:EVM:FRAME <int></code> <code>:MMEMory:LOAD:EVM:FRAME?</code>
Example	<code>:MMEM:LOAD:EVM:FRAM 1</code> <code>:MMEM:LOAD:EVM:FRAM?</code>
Preset	0
State Saved	No
Min	0
Max	100

Close VSA after recall (.setx only)

Automatically launches VSA (VSA 2021 or later version with valid license is required) in the background, if it is needed to recall the specified **.setx** file. This provides recalled settings to the 5GNR EVM measurement through an internal API. This process will be slower and will consume more memory, because VSA is running in the background.

Lets you specify whether VSA will be closed after recalling the current **.setx** file:

- ON** Close VSA to improve performance and minimize memory usage
- OFF** Keep VSA running to allow faster recall of additional **.setx** files

Remote Command	<code>:MMEMory:LOAD:EVM:VSA:RELease 0 1 OFF ON</code> <code>:MMEMory:LOAD:EVM:VSA:RELease?</code>
Example	<code>:MMEM:LOAD:EVM:VSA:REL 1</code> <code>:MMEM:LOAD:EVM:VSA:REL?</code>
Preset	OFF
State Saved	No
Range	OFF ON

7.2.16.2 Custom IQ Constellation State

Selects a text (.txt) file from which to import the Constellation States definition for the Custom IQ modulation type. This file format is the same as Signal Studio N7608C Custom IQ constellation file format and VMA Digital Demod measurement Custom IQ. To use a recalled constellation, change the PDSCH/PUSCH MCS to -1, then change the modulation format to Custom IQ.

A preloaded Constellation State file can be found under VMA directory:

`My Documents\VMA\data\DDEMOM\ConstInState`

Remote Command	<code>:MMEMory:LOAD:EVM:CONStIn:StAtE <string></code>
Example	<code>:MMEM:LOAD:EVM:CONS:STAT "myConstInState.txt"</code> Imports the constellation state from the file myConstInState.txt in the current path
Dependencies	Only appears in 5GNR Mode, in the Modulation Analysis measurement Errors are reported if the file is empty or missing, or if the file type does not match, or if there is a mismatch between the file type and the destination data type
Annotation	After recall is complete, an advisory is displayed in the message bar confirming the constellation state was loaded

7.2.17 Loss Comp

Sets the import file type to Loss Compensation Before DUT Table or to Loss Compensation After DUT Table.

Mode	NFIGURE
Parameter Name	Recall Loss Comp
Control Path	Recall
Parameter Type	ImmediateAction
SCPI Command	<code>:MMEMory:LOAD:LOSS BEFore AFTer,<file_name></code>
SCPI Example	<code>:MMEM:LOAD:LOSS BEF,"C:\LossBefore.csv"</code> <code>:MMEM:LOAD:LOSS AFT,"C:\LossAfter.csv"</code>
Notes	Three file formats are supported: Loss Compensation file (.csv), Legacy Loss Compensation file (.loss), S parameter file (.s2p)
Soft Key Label	Loss Comp
Backwards Compatibility	<code>:MMEMory:LOAD:LOSS</code>
SCPI	
Initial S/W Revision	A.04.00

For .s2p file, only the S21 component will be used for the loss compensation.

7 Save/Recall/Print
7.2 Recall

The .csv format contains the following data:

1. File Type
2. Application Name: Measurement Name
3. Version and Model Number
4. Loss Comp Data

Below is an example of a valid **.csv** Loss Compensation file:

```
[Filetype LossCompensation]
[NF:NFIG]
Ver. ***, Model ***
10, 1.0000
20, 2.0000
30, 3.0000
40, 4.0000
50, 5.0000
60, 6.0000
```

7.2.18 Data Pattern

Lets you choose a file from which to import the data pattern for generating an NRZ waveform to be used by the Audio Generator ARB.

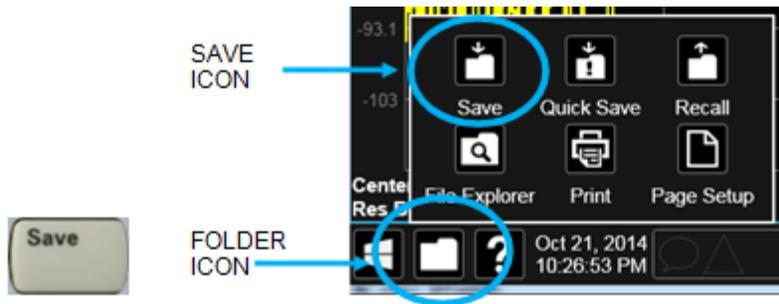

Data Pattern files are CSV files, containing the bit pattern data in a form that can be imported into Excel or other spreadsheets.

Data Pattern files have the extension **.csv**.

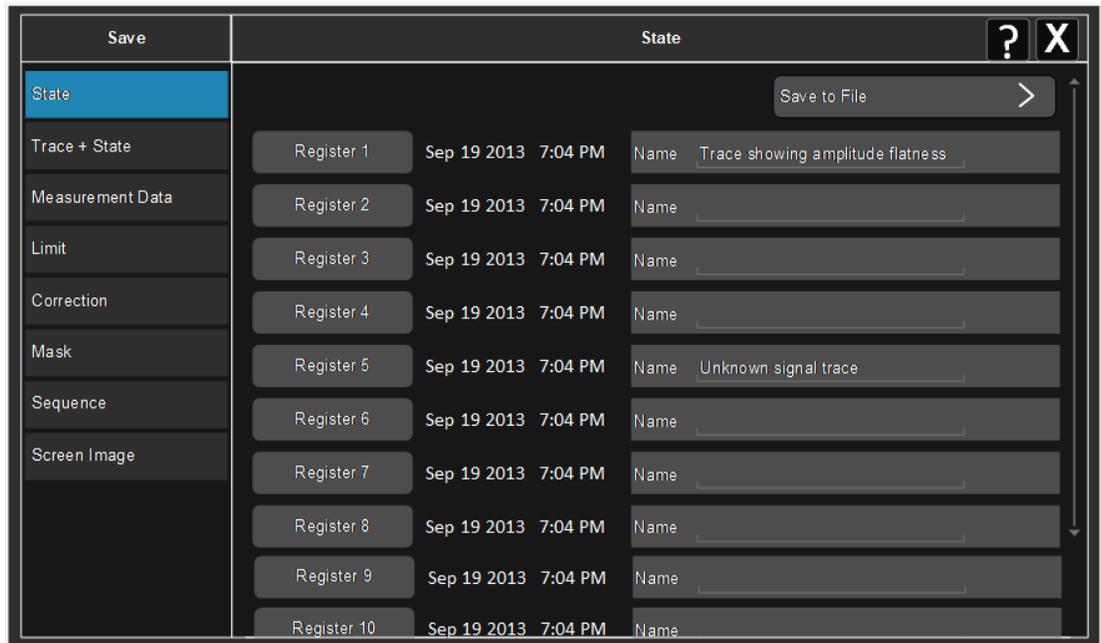

Remote Command	<code>:MMEmory:LOAD:RTS:DATA:PATtern <filename></code>
Example	Import the data pattern from the file <code>myDataPattern.csv</code> in the current path: <code>:MMEM:LOAD:RTS:DATA:PATT "myDataPattern.csv"</code>
Dependencies	Errors are reported if the file is empty or missing, or if the file type does not match, or if there is a mismatch between the file type and the destination data type
Annotation	After recall is complete, an advisory is displayed in the message bar confirming the sync pattern strings were loaded
Status Bits/OPC dependencies	Sequential - aborts the current measurement

7.3 Save

The **Save** dialog lets you save states, traces, screen images and other items from the instrument to files on the instrument's internal storage, to removable devices, and to directories on the network. You access the dialog by pressing the **Save** hardkey, or by pressing the folder icon at the bottom of the display and then pressing the **Save** icon.

The dialog has tabs running down the left side, which you use to specify what you want to save.

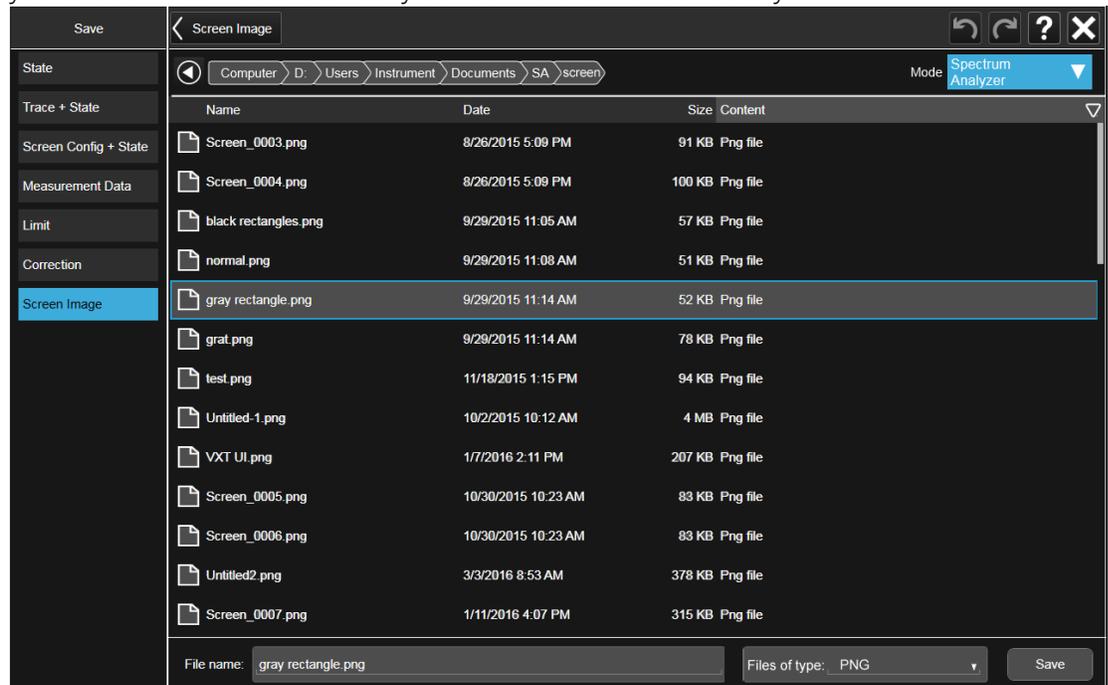

You choose the save item and then complete the save by choosing a register or file location to which to save the item.

Notes No remote command for this key specifically, but `:MMEM:STORE` is available for specific file types
Example: `:MMEM:STOR:STATe <filename>`

7.3.1 Save to File / Save As

For every Save type, a control appears labeled **Save to File** or **Save As**. **Save to File** appears for save types that also include registers (like State and Trace+State), and **Save As** appears for all other save types.

When you press **Save to File** or **Save As**, a dialog slides in from the right that allows you to see what files are already saved in the current directory.

The default directory is the internal directory for the current Mode and save type, on

the **D:** drive. You may also change to another Mode's state directory by pressing the dropdown in the upper right corner labeled **Mode**. Once you have chosen a directory, the files in that directory whose extension matches the current data type (for example, **.state** or **.trace**) are displayed in the right hand window of the dialog. You can sort this list by name, date, file size or extension by tapping the Name, Date, Size, or Content header at the top of each column. A second tap toggles the sort order between Ascending and Descending.

Also displayed is a path depiction showing the path to the current directory. In the example above, the path is **D:\Users\Instrument\Documents\SA\screen**. Tapping any element of this path lets you select an alternate route. Tapping the **Computer** arrow lets you select a different drive.

Tapping the “Back” arrow navigates to the previously selected directory.

Note: Using the C: drive is strongly discouraged, due to the risk of data being overwritten during an instrument software upgrade.

If you plug in a removable drive (for example, a thumb drive), the browser immediately navigates to the root of that drive. Furthermore, if you had a thumb drive in and you were in a directory on the thumb, and then you exit the browser, when you come back in you are still in the same directory on that removable drive. If you remove the thumb drive, you return to the directory you had been in before the thumb drive was plugged in.

Note that for each data type there is a “current” directory and it is the last directory used by either Save or Recall for that Mode. For example if in SA Mode you save a Corrections file to a particular directory, then when you go to recall a Correction in SA Mode, you should be pointing at that directory. Or if in EMC Mode you recall a Limit from a particular directory then when in EMC Mode you go to save a Limit, it should be pointing at that same directory. There is one “current” directory for each data type for each Mode (not one for Save and one for Recall).

The Filename field, just below the Path field, shows the filename that will be used. The **File Name** field is initially loaded with an automatically generated filename specific to the appropriate Save Type. The automatically generated filename is guaranteed not to conflict with any filename currently in the directory. You may edit the filename by tapping it, which brings up the onscreen alpha keyboard. Press the “Done” button on this keyboard when you are done editing.

Select a file to overwrite, type in a file name, or use the name suggested by the instrument (guaranteed not to conflict with any file in the current directory), and press Save. If the file specified already exists, a dialog will appear that allows you to replace the existing file by selecting **OK**, or you can Cancel the request.

After a successful save, a message "File <filename> saved" or "State Register <register number> saved" is displayed in an info box for a few seconds.

See ["Quick Save" on page 3185](#) for details of the automatic file naming algorithm.

7.3.2 State

Selects a register or file for saving the state.

State files contain essentially all the information required to return the instrument to the measurement and settings that were in effect at the time of the save. State files are in a proprietary binary form (for speed) and cannot be read or edited by PC software, but can be loaded back into the instrument to restore the state.

State files contain all of the settings of the **Input/Output** system as well, even though **Input/Output** variables are outside of the Mode's state and unaffected by **Mode Preset**, because these are needed to restore the complete setup.

Persistent System settings (for example, GPIB address) are affected by neither Mode Preset nor Restore Mode Defaults, nor are they included in a saved State file.

For rapid saving, the State menu lists 16 registers to which you can save states. Pressing a Register button initiates the save. You can also select a file to which to save by pressing **Save to File**.

The default path for all State Files is:

`My Documents\<mode name>\state`

where **<mode name>** is the parameter used to select the Mode with `:INST:SEL` (for example, **SA** for Spectrum Analyzer Mode).

State files have the extension `.state`. The default filename is `State_0000.state`, where the 4-digit number is the lowest number that does not conflict with any filename in the current directory.

NOTE

In products that run multiple simultaneous instances of the X-Series Application, all instances share the same registers and file directories, so take care not to overwrite files and/or registers from one instance which were saved by another instance.

Remote Command `:MMEMory:STORe:STATe <filename>`

Example `:MMEM:STOR:STATe "MyStateFile.state"`

This stores the current instrument state data in the file `MyStateFile.state` in the default directory

Notes

- Both single and double quotes are supported for any filename parameter over remote
- After saving to a register, that register's menu key is updated with the date the time, unless a custom label has been entered for that key
- After saving to a register, you remain in the **Save State** menu, so that you can see the Register key update. After saving to a file, the instrument automatically returns to the previous menu and any Save As dialog goes away

Backwards `:MMEMory:STORe:STATe 1,<filename>`

Compatibility SCPI	For backwards compatibility, the above syntax is supported. The "1" is simply ignored. The command is sequential
-----------------------	--

7.3.2.1 Register 1 thru Register 16

Selecting any one of these register buttons causes the State of the currently active Mode to be saved to the specified Register. The registers are provided for rapid saving and recalling, since you do not need to specify a filename or navigate to a file. Each of the register menu keys annotates whether it is empty or at what date and time it was last modified. In addition, you can edit any of the register names to enter custom names for any register.

Although these 16 registers are the only registers available from the front panel, there are 128 state registers available in the instrument. Registers 17-128 are only available from the SCPI interface, using the *SAV command.

There is one set of 128 state registers in the instrument, not one set for each Mode. When a state is saved, the Mode it was saved from is saved with it; then when it is recalled, the instrument switches to that Mode.

NOTE

In products that run multiple simultaneous instances of the X-Series Application, all instances share the same registers and file directories, so take care not to overwrite files and/or registers from one instance which were saved by another instance.

The date displayed follows the format specified in the **Date Format** setting under the Control Panel. The time shows hours and minutes.

After the save completes, the corresponding register menu key annotation is updated with the date and time and the message "Register <register number> saved" is displayed.

Example	*SAV 1
Range	1-16 from front panel, 1-128 from SCPI

7.3.2.2 Edit Register Names

You may enter a custom name for any of the Registers, to help you remember what you are using that state to save. To do this, press the **Name** field for the register you want to rename, which brings up the onscreen alpha keyboard. Press **Done** on this keyboard when you are done editing.

The maximum number of characters for a register name is 30. If you delete all the characters in the custom name, it restores the default (time and date).

7 Save/Recall/Print
7.3 Save

The register names are stored within the state files, but they are not part of the instrument state; that is, once you have edited a register name, loading a new state will not change that register name. Another consequence of this is that the names will be persistent through a power cycle. Also, if a named state file is transferred to another instrument, it will bring its custom name along with it.

If you try to edit the name of an empty register, the instrument will first save the state to have a file to put the name in. If you load a named state file into an instrument with older firmware it will ignore the metadata.

The ***SAV** and ***RCL** commands will not be affected by the custom register names, nor will the **:MMEM** commands.

Remote Command	<code>:MMEMory:REGister:STATe:LABel <reg number>,"label"</code> <code>:MMEMory:REGister:STATe:LABel? <reg number></code>
Example	<code>:MMEM:REG:STAT:LAB 1,"my label"</code>
Notes	<p><code><reg number></code> is an integer from 1 to 16. If the SCPI specifies an invalid register number an error message is generated, -222, "Data out of range; Invalid register label number"</p> <p><code>"label"</code> is a string from 0 to 30 characters in length. If a label exceeds 30 characters, an error message is generated, -150,"String data error; Label clipped to 30 characters"</p> <p><code>"label"</code> of zero length erases the custom label and restores the default (time and date) label. For example, <code>:MMEM:REG:STAT:LAB 1,""</code></p>
Preset	The names are unaffected by Preset or power cycle but are set to the default label (time and date) on Restore System Defaults>Misc

7.3.3 Trace+State

Selects a register or file for saving selected traces and the state.

Trace+State files contain essentially all the information required to return the instrument to the measurement and settings that were in effect at the time of the save, as well as the data for one or all traces. Trace+State files are in a proprietary binary form (for speed) and cannot be read or edited by PC software, but can be loaded back into the instrument to restore the state and trace(s).

Trace+State files contain all of the settings of the **Input/Output** system as well, even though **Input/Output** variables are outside of the Mode's state and unaffected by **Mode Preset**, because these are needed to restore the complete setup.

Persistent **System** settings (for example, GPIB address) are affected by neither Mode Preset or Restore Mode Defaults, nor are they included in a saved Trace+State file.

For rapid saving, the **Trace+State** menu lists 16 registers to which you can save trace+state files. The **Trace+State** registers are separate registers from the **State** registers. Pressing a Register button initiates the save. You can also select a file to which to save by pressing "Save to File".

The default path for all Trace+State files is the same as that for State files:

`My Documents\\state`

where `<mode name>` is the parameter used to select the mode with `:INST:SEL` (for example, `Basic` for IQ Analyzer Mode).

NOTE

In products that run multiple simultaneous instances of the X-Series Application, all instances share the same registers and file directories, so take care not to overwrite files and/or registers from one instance which were saved by another instance.

Trace+State files have the extension `.trace`. The default filename is `State_0000.trace`, where the 4-digit number is the lowest number that does not conflict with any filename in the current directory.

The **Trace+State** selection only appears for measurements that support trace saves. It is blanked for modes that do not support trace saves. Saving Trace is identical to saving State except a `.trace` extension is used on the file instead of `.state`, and internal flags are set in the file indicating which trace was saved.

See "[More Information](#)" on page 3221.

Remote Command	<code>:MMEMory:STORe:TRACe TRACE1 TRACE2 TRACE3 TRACE4 TRACE5 TRACE6 ALL,<filename></code> <code>:MMEMory:STORe:TRACe:REGister TRACE1 TRACE2 TRACE3 TRACE4 TRACE5 TRACE6 ALL,<integer></code>
----------------	--

Example	<code>:MMEM:STOR:TRAC TRACE1,"myState.trace"</code> saves the file <code>myState.trace</code> on the default path and flags it as a "single trace" file with Trace 1 as the single trace (even though all of the traces are in fact stored) <code>:MMEM:STOR:TRAC ALL,"myState.trace"</code> saves the file <code>myState.trace</code> on the default path and flags it as an "all traces" file <code>:MMEM:STOR:TRAC:REG TRACE1,2</code> stores trace 1 data in trace register 2
---------	--

Notes	This command actually performs a Save State, which in the Swept SA measurement includes the trace data. However it flags it (in the file) as a "save trace" file of the specified trace (or all traces) Some modes and measurements do not have available all 6 traces. The Phase Noise mode command, for example, is: <code>:MMEMory:STORe:TRACe TRACE1 TRACE2 TRACE3 ALL,<filename></code> Some modes and measurements have more than 6 traces available. The Realtime SA mode command, for example, is: <code>:MMEMory:STORe:TRACe TRACE1 TRACE2 TRACE3 TRACE4 TRACE5 TRACE6 TRACE7 TRACE8 TRACE9 TRACE10 TRACE11 TRACE12 ALL,<filename></code> The range for the register parameter is 1-5 When you initiate a save, if the file already exists, a dialog will appear that allows you to replace the
-------	--

existing file by selecting **OK** or you can Cancel the request. If you select **OK**, the file will be overwritten. Using the C: drive is strongly discouraged, since it runs the risk of being overwritten during an instrument software upgrade

Both single and double quotes are supported for any filename parameter over remote

After saving to a register, that register's menu key is updated with the date and time of the save

After saving to a register, you remain in the **Save Trace** menu, so that you can see the Register key update. After saving to a file, the instrument automatically returns to the previous menu and any Save As dialog goes away

More Information

In measurements that support saving Traces, for example, Swept SA, the Trace data is saved along with the State in the State file. When recalling the State, the Trace data is recalled as well. Traces are recalled exactly as they were stored, including the writing mode and update and display modes. If a Trace was updating and visible when the State was saved, it will come back updating and visible, and its data will be rewritten right away. When you use State to save and recall traces, any trace whose data must be preserved should be placed in View or Blank mode before saving.

The following table describes the Trace Save and Recall possibilities:

You want to recall state and one trace's data, leaving other traces unaffected	Save Trace+State from 1 trace. Make sure that no other traces are updating (they should all be in View or Blank mode) when the save is performed	On Recall, specify the trace you want to load the one trace's data into. This trace will load in View. All other traces' data will be unaffected, although their trace mode will be as it was when the state save was performed
You want to recall all traces	Save Trace+State from ALL traces	On Recall, all traces will come back in View (or Blank if they were in Blank or Background when saved)
You want all traces to load exactly as they were when saved	Save State	On recall, all traces' mode and data will be exactly as they were when saved. Any traces that were updating will have their data immediately overwritten

7.3.3.1 Save From Trace

Selects the trace to be saved. The default is the currently selected trace, selected in this this or any other menu with Trace selection. If you have chosen All then it remains chosen until you specifically change it to a single trace, regardless of the trace selected in the **Trace** menu.

When you select a trace, it makes that trace the current trace, so it displays on top of all of the other traces.

7.3.3.2 Register 1 thru Register 16

Selecting any one of these register buttons causes the specified trace(s) and the state of the currently active mode to be saved to the specified Register. The registers are provided for rapid saving and recalling, since you do not need to specify a filename or navigate to a file. Each of the register menu keys annotates whether it is empty or at what date and time it was last modified. In addition, you can edit any of the register names to enter custom names for any register.

There is one set of 16 trace+state registers in the instrument, not one set for each Mode. When trace+state is saved, the Mode it was saved from is saved with it; then when it is recalled, the instrument switches to that Mode.

NOTE

In products that run multiple simultaneous instances of the X-Series Application, all instances share the same registers and file directories, so take care not to overwrite files and/or registers from one instance which were saved by another instance.

The date displayed follows the format specified in the **Date Format** setting under the Control Panel. The time shows hours and minutes.

After the save completes, the corresponding register menu key annotation is updated with the date and time and the message "Register <register number> saved" is displayed.

Example	*SAV 1
Range	1-16

7.3.3.3 Edit Register Names

You may enter a custom name for any of the Registers, to help you remember what you are using that trace+state to save. To do this, press the **Name** field for the register you want to rename, which brings up the onscreen alpha keyboard. Press the "Done" button on this keyboard when you are done editing.

The maximum number of characters for a register name is 30. If you delete all the characters in the custom name, it restores the default (time and date).

The register names are stored within the trace+state files, but they are not part of the instrument state; that is, once you have edited a register name, loading a new state will not change that register name. Another consequence of this is that the names will be persistent through a power cycle. Also, if a named state file is transferred to another instrument, it will bring its custom name along with it.

7 Save/Recall/Print
7.3 Save

If you try to edit the name of an empty register, the instrument will first save the trace+state to have a file to put the name in. If you load a named state file into an instrument with older firmware it will ignore the metadata.

Remote Command	<code>:MMEMory:REGister:TRACe:LABel <reg number>,"label"</code> <code>:MMEMory:REGister:TRACe:LABel? <reg number></code>
Example	<code>:MMEM:REG:TRAC:LAB 1,"my label"</code>
Notes	<code><reg number></code> is an integer from 1 to 16. If the SCPI specifies an invalid register number an error message is generated, -222, "Data out of range; Invalid register label number" <code>"label"</code> is a string from 0 to 30 characters in length. If a label exceeds 30 characters, an error message is generated, -150, "String data error; Label clipped to 30 characters" <code>"label"</code> of zero length erases the custom label and restores the default (time and date) label, e.g., <code>:MMEM:REG:TRAC:LAB 1,""</code>
Preset	The names are unaffected by Preset or power cycle but are set to the default label (time and date) on Restore System Defaults>Misc

7.3.4 Screen Config + State

Saves the complete configuration of all your screens to a file. You choose a file to which to export the data.

Remote Command	<code>:MMEMory:STORe:SCONfig <filename></code>
Example	<code>:MMEM:STOR:SCON "myScreenConfig.screen"</code> This stores the current screen configuration in the file <code>myScreenConfig.screen</code> in the default directory

7.3.5 Measurement Data

Specifies a data type (for example, trace data) and choose a file to which to export the data.

Measurement Data files are Comma-Separated Value (CSV) files, and contain the requested data in a form that can be imported into Excel or other spreadsheets, as well as header data that gives information on relevant instrument settings at the time the save occurred.

The main application of **Measurement Data** files is for importing data to a PC for analysis, but in some cases **Measurement Data** files can also be imported back into the instrument to recreate the data object that existed at the time of the save. For example, most Trace data files can be imported back into the instrument.

The default path for **Measurement Data** Files is:

`My Documents\<mode name>\data`

with the subdirectory reflecting the data type and where **<mode name>** is the parameter used to select the Mode with **:INST:SEL** (for example, **SA** for Spectrum Analyzer Mode) and **<measurement name>** is the parameter used to select the measurement with **:CONF** (for example, **SAN** for Swept SA). For example, a Peak Table file from Swept SA would be stored in:

`My Documents\SA\data\SAN\results`

Measurement Data files have extension **.csv**. The default filename is **Prefix_0000.csv**, where the 4-digit number is the lowest number that does not conflict with any filename in the current directory, and “Prefix” is dependent on the data type:

Type	Default Prefix
Traces	Trace_
Measurement Result	MeasR_
Capture Buffer	CapBuf_

For example, the default filename for a trace data file in an empty directory would be **Trace_0000.csv**

7.3.5.1 Save From

Selects the specific item to be saved, for example, if you are exporting trace data you may specify Trace 1, Trace 2, etc.

The default for traces is the currently selected trace, selected in this this or any other menu with Trace selection. If you have chosen All then it remains chosen until you specifically change it to a single trace, regardless of the trace selected in the Trace menu. The **All** selection saves all six traces in one .csv file with the x-axis data in the first column and the individual trace data in succeeding columns. The header data and x-axis data in this file reflect the current settings of the measurement. Note that any traces which are in View or Blank may have different x-axis data than the current measurement settings; but this different x-axis data will not be output to the file.

Preset	Not part of Preset , but is reset to by Restore Mode Defaults Survives shutdown
--------	--

7.3.5.2 Data Type

You choose the data type to save by using the radio button selection box. Below are the specifications for Data files for each measurement.

Notes	There is no SCPI command for Data Type, as the type is implied in the SCPI command for each item
Dependencies	The Data Type menu for any given measurement only contains data types that are supported by that measurement

Meas Results

Meas Results files contain information that describes the current state of the instrument. It is detailed in the Meas Result File Contents below.

This command is only available in certain measurements, such as:

- PowerSuite: Channel Power, OBW, ACP, Spectrum Emissions Mask, Spurious Emissions, Power Stat CCDF, Transmit Power, Monitor Spectrum, IQ Waveform
- IQ Analyzer: Complex Spectrum
- Phase Noise: Log Plot and Spot Frequency
- WCDMA: Code Domain, Mod Accuracy, Power Control, and QPSK EVM
- Analog Demod: AM, FM, PM and FM Stereo
- Noise Figure
- Pulse

In general, the data in the Meas Results file matches the data which is returned to a measurement data query (`:FETCh?/:READ?/:MEASure?`). These queries and the results they return are documented for each measurement, and can be found in the Help for that measurement (or in the manual for that measurement) in the section titled “Remote Command Results”.

For example, for the Complex Spectrum measurement, go to the Help topic “Complex Spectrum Measurement” and you will see a section called “Remote Command Results for Complex Spectrum”.

The table in that section lists a number of return values for the `:FETCh` query (in this case, the `:FETCh:SPECTrum` query), which depend on the specified subopcode (`n`).

In the MeasResults file, you will see a column for each value of `n`. Each column contains the value for the corresponding value of `n` in the Remote Command Results table.

For example, Complex Spectrum allows values of `n` up to 17, and the MeasResults file for Complex Spectrum has 17 columns. So the data returned when you send `:FETCh:SPECTrum1?` matches the data in the column labelled “MeasResult1” of the Meas Results file. See the example below:

Response to FETCh:SPECTrum1?:

```
2.125444221E+01,6.487077992E+07,2.050000000E+02,6.004725051E+07,3.9215  
68627E+04,2.370000000E+02,0.000000000E+00,1.000000000E-  
07,1.000000000E+00,2.360000000E-05,2.500000000E+01
```

MeasResult1 column from Meas Results file:

```
MeasResult1
-21.25444221
64870779.92
205
60047250.51
39215.68627
237
0
1.00E-07
1
2.36E-05
25
```

In addition, examples of the Meas Results files are given for each data type in the Help below.

Remote Command	<code>:MMEMory:STORe:RESults <string></code>
Example	<code>:MMEM:STOR:RES "MeasR_0000.csv"</code>
Notes	<p>If the save is initiated via SCPI and the file already exists, the file will be overwritten</p> <p>The SCPI command exports measurement results to the file specified as the parameter in the current path. The default path is:</p> <p><code>My Documents\<current mode>\data\<measurement name>\results</code></p> <p>where <code><mode name></code> is the parameter used to select the mode with the <code>:INST:SEL</code> command (for example, <code>SA</code> for Spectrum Analyzer Mode) and <code><measurement name></code> is the parameter used to select the measurement with the <code>:CONF:</code> command (for example, <code>SAN</code> for the Swept SA measurement)</p> <p>Using the C: drive is strongly discouraged, since it runs the risk of being overwritten during an instrument software upgrade</p> <p>The SCPI parameter is a quoted string, which specifies the filename. Both single and double quotes are supported for any filename parameter over SCPI</p>
Annotation	After the save is complete, an advisory is displayed in the window so that the user can confirm which file was saved
Status Bits/OPC dependencies	Sequential – waits for the previous measurement to complete

CHP Meas Results File Contents

PP_Substitute: [meas_chp/CHP Meas Results File Contents.htm](#)

OBW Meas Results File Contents

PP_Substitute: [meas_obw/OBW Meas Results File Contents.htm](#)

ACP Meas Results File Contents

PP_Substitute: meas_acp/ACP Meas Results File Contents.htm

SPUR Meas Results File Contents

PP_Substitute: meas_spur/SPUR Meas Results File Contents.htm

SEM Meas Results File Contents

PP_Substitute: meas_sem/SEM Meas Results File Contents.htm

CCDF Meas Results File Contents

PP_Substitute: meas_pst/CCDF Meas Results File Contents.htm

TXP Meas Results File Contents

A TXP Meas Results File contains measurement results with the following header information:

- File ID string, which is "MeasResult"
- Measurement ID following Mode ID, which is "SA:TXP" for example
- Firmware rev and model number
- Option string
- Center Frequency
- TXP_InfoBw
- TXP_Used_CaptureTime

The header data is followed by a line containing entries "MeasResult1" to "MeasResult4", which flags the start of the measurement results. Each line of Measurement Results consists of four comma separated-values, from the MeasResult1 value to the MeasResult4 value.

MeasResult1 contains the same results as [MEAS/READ/FETCh:TXPower | BPOwer1](#); MeasResult2, [MEAS/READ/FETCh:TXPower | BPOwer2](#); and so on.

The exported file has **.csv** extension. A typical Meas Results file, when imported into Excel, would appear as follows:

```

MeasResult
SA:TXP
A.10.53                               N9030A
526 ALV ATP B1X B1Y B25 B40 BBA      1
CR3 CRP DCF DDA DP2 DRD EA3
EDP EMC EP1 ERC ESC ESP EXM

Center Frequency                       1.33E+10
TXP_InfoBw                             3000000
TXP_Used_CaptureTime                   0.00064
MeasResult1                            MeasResult2      MeasResult3      MeasResult4
0
-999

```

IQ Waveform Meas Results File Contents

PP_Substitute: meas_wav/IQ Waveform Meas Results File Contents.htm

5G NR EVM Meas Results

A set of measurement results tables. The Main file contains header information, plus a list of sub-files. The fields in the Main file are as follows:

- File ID string, which is **MeasResult**
- Measurement ID following Mode ID, which is **NR5G:EVM**
- Firmware rev and model number
- Option string
- Center Frequency
- Link Direction
- Component Carrier Bandwidth
- Component Carrier State
- Component Carrier Frequency Range
- Number of Component Carriers

7 Save/Recall/Print
7.3 Save

- Error Summary of each Component Carrier (see [MEAS | READ | FETCH: EVM000001](#) for corresponding data)
- Sub Meas Results Files

The following sub Meas Results Files are also generated:

Result Set	File name
Meas IQ data for each CC: when constellation is displayed	[Main Meas Results File name]_CCxIQMeas.csv
Reference IQ data for each CC: when constellation is displayed	[Main Meas Results File name]_CCxIQRef.csv
Error Vector data for each CC: when error vector trace is displayed	[Main Meas Results File name]_CCxEVM.csv
RE Power for each CC: when demod power trace is displayed	[Main Meas Results File name]_CCxPowerRE.csv
Channel Allocation for each CC: when detected allocation trace is displayed	[Main Meas Results File name]_CCxDetectedAlloc.csv
Decode Bits for each CC: when decoding is turned on	[Main Meas Results File name]_CCxBits.csv
Condition Number for each CC: when MIMO Condition Number trace is displayed	[Main Meas Results File name]_CCxConditionNumber.csv
H Matrix for each CC: when MIMO H Matrix Table is displayed	[Main Meas Results File name]_CCxHMatrix.csv

7.3.6 Limit

Lets you choose a file to which to export the Limit data.

Limit files are CSV files, and contain the limit data in a form that can be imported into Excel or other spreadsheets, as well as header data that gives information on the limit.

The default path for most Limits Files is:

`My Documents\<mode name>\data\limits`

where `<mode name>` is the parameter used to select the mode with the `:INST:SEL` command (for example, `SA` for Spectrum Analyzer). Hence a Limit file from any measurement in Spectrum Analyzer Mode would be stored in:

`My Documents\SA\data\limits`

The default path for Limit files from the Log Plot measurement in Phase Noise Mode is:

`My Documents\PNOISE\data\LPL\limits`

The default filename is `Limit_0000.csv`, where the 4-digit number is the lowest number that does not conflict with any filename in the current directory.

For backwards compatibility, older limit files with the extension `.lim` can be read into the instrument, but you can only save limits as `.csv` files.

Remote Command	<code>:MMEMory:STORe:LIMit LLINE1 ... LLINE6,<filename></code>
Example	<code>:MMEM:STOR:LIM LLINE2,"myLimitLine2.csv"</code> Saves the 2nd Limit Line to the file <code>myLimitLine2.csv</code> in the current path
Notes	If the save is initiated via SCPI, and the file already exists, the file will be overwritten Using the C: drive is strongly discouraged, since it runs the risk of being overwritten during an instrument software upgrade Both single and double quotes are supported for any filename parameter over SCPI
Dependencies	This key only appears if you have the proper option installed in your instrument In the Log Plot measurement in Phase Noise Mode, there are only three Limit Lines, so the valid parameters are <code>LLINE1 LLINE2 LLINE3</code>
Preset	1 Not part of Preset, but is reset by Restore Mode Defaults Survives power cycles
State Saved	The selected Limit number is saved in instrument state
Status Bits/OPC dependencies	Sequential - waits for previous measurement to complete

Limit File Contents

Limits may be exported into a data file with a `.csv` extension. They may be imported from that data file; they may also be imported from a legacy limit file with a `.lim` extension. The `.lim` files meet the specification for limit files contained in the EMI measurement guide, HP E7415A.

.csv file format

Except for information in quotes, limit line files are not case sensitive. Information in bold is required verbatim; other text is example text, and italic text is commentary which should not be present in the file.

The first five lines are system-required header lines, and must be in the correct order:

Limit	<i>Data file type name</i>
"FCC Part 15"	<i>File Description</i>
"Class B Radiated"	<i>Comment</i>
A.01.00.R0001,N9020A	<i>Instrument Version, Model Number</i>
P13 EA3 UK6 ,01	<i>Option List, File Format Version</i>

The next few lines describe the parameters; on export they will be in the order shown, on import they can be in any order. If some parameters are missing, they will revert to the default.

Type, Upper	<i>Upper Lower</i>
X Axis Unit, MHz	<i>MHz S; other units should be converted; this also specifies the domain</i>
Amplitude Unit, dBm	<i>dBm V; all other units should be converted appropriately</i>
Frequency Interpolation, Linear	<i>Logarithmic Linear</i>
Amplitude Interpolation, Logarithmic	<i>Logarithmic Linear</i>
X Control, Fixed	<i>Fixed Relative; on input we consider only the first three characters</i>
Y Control, Fixed	<i>Fixed Relative; on input we consider only the first three characters</i>
Margin, 0	<i>Always in dB. A 0 margin is equivalent to margin off</i>
X Offset, 10	<i>Expressed in the X axis units</i>
Y Offset, 5	<i>Expressed in the Amplitude units</i>

The Amplitude Unit line in the limits file may contain a transducer (formerly “antenna”) factor unit, for example:

Amplitude Unit=dBuV/m

Transducer factor units are dBuV/m, dBuA/m, dBpT, and dBG. In this case, the unit is treated exactly as though it were dBuV, meaning that all of the limits are interpreted to have units of dBuV. The box does NOT change Y Axis Units when such a limit is loaded in.

The X-Axis unit also specifies the domain (time or frequency). It is not possible to have both time-domain lines and frequency-domain lines at the same time; if a time-domain line is imported while the other lines are in the frequency domain (or vice-versa), all limit lines will be deleted prior to import.

If the sign of the margin is inappropriate for the limit type (for example a positive margin for an upper limit), the sign of the margin will be changed internally so that it is appropriate.

The remaining lines describe the data. Each line in the file represents an X-Y pair. The X values should be monotonically non-decreasing, although adjacent lines in the file can have the same X value as an aid to building a stair-stepped limit line. To specify a region over which there is no limit, use +1000 dBm for upper limits or – 1000 dBm for lower limits.

The data region begins with the keyword **DATA**:

DATA
200.000000,-10.00
300.000000,-10.00
300.000000,-20.00
500.000000,-20.00

.lim file format

This is a legacy format which allows files saved from older instruments to be loaded into the X-Series. *Design of files in this format is not recommended.*

Except for name and description text (which is taken verbatim), limit line files are not case sensitive.

The file may optionally start with a description block, consisting of the single line **[DESCRIPTION]** followed by arbitrary text. If there is no Limit Line Name header, the description text will be used as the limit line description in the GUI. If there is a Limit Line Name header, the Limit Line Name will be used instead.

Arbitrary text

The header block begins with the single line **[HEADER]**, followed by some or all of the following fields, each with **<parameter name>=<parameter value>**. Excess white space around the “=” is ignored. If a field is not present or the data is invalid, the value is not changed when the limit line is loaded. Ordering of the fields is unimportant.

Limit Line Name="FCC Part 15;Class B Radiated"	
Type =Upper	Upper Lower
Frequency Unit =MHz	For time domain limits, this should say "Time Unit"
Amplitude Unit=dBm	
Frequency Interpolation=Lin	Log Lin; on input we consider only the first three characters
Amplitude Interpolation=Log	Log Lin; on input we consider only the first three characters
Mode=Fixed	Fixed Relative
Margin=0	Always in dB. A 0 margin is equivalent to margin off
Domain=Frequency	Frequency Time
Delimiter=TAB	

The data block begins with the line **[DATA]**, and consists of any number of segments.

The Data lines represent segments – X1, Y1, X2, Y2. If the list of segments includes a gap in the middle on input, the space inside the gap will be set to ensure the limit does not fail: for upper limits maxtracevalue, for lower limits mintracevalue. If two segments overlap on input, the stricter of the two segments is used – for upper limits the lower segment, for lower limits the upper segment.

Thus, the following segments indicate into a –5 dB limit from 10 MHz to 20 MHz and 30 MHz to 40MHz:

10	–5	20	–5
30	–5	40	–5

7 Save/Recall/Print
7.3 Save

If this was an upper limit, this would be translated into the following set of limit points:

10			-5	
20			-5	
20			maxtracevalue	
30			maxtracevalue	
30			-5	
40			-5	
	30	-29.5	88	-29.5
	88	-33	216	-33
	230	-35.6	960	-35.6
	960	-43.5	5000	-43.5

note that we are stair-stepping the line
The gap between 216 MHz and 230 MHz will never fail

7.3.6.1 Select Limit

Selects the specific Limit to be saved, for example, Limit 1.

Preset	Not part of Preset, but is reset to LLINE1 by Restore Mode Defaults Survives shutdown
--------	--

7.3.7 Correction

Exports Amplitude Corrections files in the PC-readable **.csv** format.

Amplitude Correction files are CSV files, and contain the correction data in a form that can be imported into Excel or other spreadsheets, as well as header data that gives information on the correction.

The default filename is **Ampcor_0000.csv**, where the 4-digit number is the lowest number that does not conflict with any filename in the current directory.

The default path for Corrections files is:

My Documents\amplitudeCorrections

For backwards compatibility, older limit files with the extension **.amp**, **.cbl**, **.ant** and **.oth** can be read into the instrument, but you can only save corrections as **.csv** files.

See **"Correction Data File" on page 3234**

Remote Command	:MMEMory:STORe:CORRection 1 ... 8, <filename>
Example	:MMEM:STOR:CORR 2 "myAmpcor.csv"

	saves Correction 2 to the file <code>myAmpcor.csv</code> on the current path
Notes	<p>If the save is initiated via SCPI, and the file already exists, the file will be overwritten</p> <p>Using the C: drive is strongly discouraged, since it runs the risk of being overwritten during an instrument software upgrade</p> <p>Both single and double quotes are supported for any filename parameter over SCPI</p>
Dependencies	<p>Corrections are not supported by all Measurements. If in a Mode in which some Measurements support it, this key will be grayed out in measurements that do not. The key will not show at all if no measurements in the Mode support it</p> <p>This key does not appear unless you have the proper option installed in your instrument</p>
Annotation	After save is complete, an advisory is displayed in the message bar confirming which file was saved
Backwards Compatibility SCPI	<code>:MMEMory:STORe:CORRection ANTenna CABLe OTHer USER, <filename></code>
	For backwards compatibility, ANTenna maps to 1, CABLe maps to 2, OTHer maps to 3 and USER maps to 4

Correction Data File

A Correction Data File contains a copy of one of the instrument correction tables. Corrections provide a way to adjust the trace display for predetermined gain curves (such as for cable loss).

Corrections files are text files in `.csv` (Comma-Separated Values) form, to make them importable into Excel or other spreadsheet programs. The format for Corrections files is as follows:

Line #	Type of field	Example	Notes
1	File type, must be "Amplitude Correction"	Amplitude Correction	May not be omitted
2	File Description (in quotes)	"Correction Factors for 11966E"	60 characters max; may be empty but may not be omitted. If exceeds 60 characters, error -233 Too much data reported
3	Comment (in quotes)	"Class B Radiated"	60 characters max; may be empty but may not be omitted. . If exceeds 60 characters, error -233 Too much data reported
4	Instrument Version, Model #	A.02.06,N9020A	May be empty but may not be omitted
5	Option List, File Format Version	K03 LFE EXM ,01	May be empty but may not be omitted
6	Freq Unit to be used for all frequency values	Frequency Unit, MHz	assumed to be Hz if omitted

7 Save/Recall/Print

7.3 Save

Line #	Type of field	Example	Notes
	in the file		
7	Transducer Unit	Antenna Unit, None	If omitted leaves the Transducer unit unchanged. The amplitude unit in the Transducer Unit field is a conversion factor that is used to adjust the Y Axis Units of the current mode, if the mode supports Transducer Units. For more details on transducer correction data, refer to the Input/Output, Corrections key description. Allowable values: dBuV/m, dBuA/m, dBG, dBpT, None
8	Freq Interpolation	Frequency Interpolation, Linear	if omitted leaves the Freq Interpolation unchanged. Allowable values: Linear, Logarithmic
9	Bias value in mA	Bias,0.00	If omitted leaves the Bias value unchanged (added as of A.08.50)
10	Bias State	Bias State,On	If omitted leaves the Bias State unchanged. Allowable values: On, Off (added as of A.08.50)
11	Overlap, two values, Freq1 and Freq2, separated by commas	Overlap,33500,40000	Uses Freq Unit from line 6. Thus, in this example Freq1=33.5 GHz, Freq2=40.0 GHz (see note below). If omitted leaves the overlap unchanged (added as of A.08.50)
12	DATA marker	DATA	Corrections data begins in the next line

Lines 2 through 5 can be empty but must appear in the file. Lines 6 through 11 are optional, the lines can be left out of the file altogether.

The Overlap row and the two Bias rows apply only to external mixing. Both are read-only, they are never written by the instrument. The only way to insert or modify these rows is to edit the file with a text editor or a spreadsheet editor. These rows are intended for use by mixer manufacturers, as they allow the manufacturer to insert data about how the mixer corrections were generated and how they should be applied. The Bias rows allow you to specify whether to turn Bias on or off when the Correction is turned on and to specify a Bias value (turning off the Correction does not change the Bias, but turning it back on again sets it to the value specified in the file). The Overlap row allows you to specify an overlap region in which two different corrections may be applied. It is expected that in the corrections data itself, there will be TWO corrections values exactly at Max Freq, otherwise Overlap is ignored. The way the overlap is processed is as follows: if at any given time the current instrument Start Freq is greater than Freq 1 and lower than Freq 2, and the current Stop Freq is greater than Freq 2, extend the first correction point at or above

Freq 2 down to Freq 1, rather than using the correction data between Freq1 and Freq2.

Only one Transducer units can be on at any given time. Note that this means that if a correction file with a Transducer Unit is loaded into a particular Correction, all other Corrections are set to that same Transducer unit. Note that the legacy term "Antenna Unit" is still used in the correction file, even though the more modern term "Transducer Unit" is used in the user interface.

Similarly, the Bias rows can only be used in Correction register 1, because there can only be one setting for Bias at any given time. If a Correction file with a Bias or Bias State row is loaded into any Correction register but 1, an error is generated: Mass storage error; Can only load Bias Settings into Correction 1

The data follows the DATA row, as comma separated X, Y pairs; one pair per line.

For example, suppose you have an Antenna to correct for on an N9020A version A.02.06 and the correction data is:

- 0 dB at 200 MHz
- 17 dB at 210 MHz
- 14.8 dB at 225 MHz

Then the file will look like:

- Amplitude Correction
- "Correction Factors for 11966E"
- "Class B Radiated"
- A.02.06,N9020A
- P13 EA3 UK6,01
- Frequency Unit, MHz
- Antenna Unit, dBuV/m
- Frequency Interpolation, Linear
- DATA
- 200.000000,0.00
- 210.000000,17.00
- 225.000000,14.80

The choices for the 1 of N fields in the metadata are as follows:

7 Save/Recall/Print
7.3 Save

- Frequency Unit: Hz, kHz, MHz, GHz
- Antenna Unit: dBuV/m, dBuA/m, dBG, dBpT, None
- Frequency Interpolation: Logarithmic, Linear

7.3.7.1 Select Correction

Selects the specific Correction to be saved, for example, Correction 1.

Preset	Not part of a Preset, but is reset to Correction 1 by Restore Input/Output Defaults Survives a shutdown
--------	---

7.3.8 Correction Group

Selects **Correction Group** as the data type to be exported with a save request. The next step is to select the **Save As** key in the **Save Data** menu.

Remote Command	<code>:MMEMory:STORe:CORRection:GR0up <filename></code>
Example	<code>:MMEM:STOR:CORR:GRO "D:\myAmpcorGroup.csv"</code> saves Correction Group to the file <code>myAmpcorGroup.csv</code>
Notes	If the save is initiated via SCPI, and the file already exists, the file and the directory will be overwritten Using the C: drive is strongly discouraged, since it runs the risk of being overwritten during an instrument software upgrade Both single and double quotes are supported for any filename parameter over SCPI
Dependencies	This file type is supported in EMI Receiver and Spectrum Analyzer Modes, if option EMC or EMI Receiver mode is present
Annotation	After save is complete, an advisory is displayed in the message bar confirming which file was saved

Correction Group File

A Correction Group file contains the correction group settings (that is, Antenna unit, break, description and comment) range table and correction files data. Corrections files are text files in `.csv` (Comma-Separated Value) format, to make them importable into Excel or other spreadsheet programs.

7.3.9 SCPI Recorder

Contains controls to allow you to save SCPI recordings.

7.3.9.1 Save To File

Saves SCPI recording content to a file. For details of the SCPI Recording feature, see ["SCPI Recorder" on page 2825](#).

The default file format is text, with the extension `.txt`. The saved file content does not include the label of each recorded entry, just the SCPI mnemonics. The file is saved to the following folder:

```
<user_name>:\Documents\Keysight\Infrastructure\ScpiRecording folder
```

7.3.10 Mask

The **Mask** data type is used to import and export Mask files for measurements that use masks, such as cellular comms and real-time measurements.

7.3.11 Waveform Sequence

Saves waveform sequences from the ARB memory of an Internal Source. When you open the Save **Waveform Sequence** dialog and press **Save**, the current waveform sequence is saved to the selected directory.

Notes	No remote command, front panel only
Dependencies	Only appears if your hardware includes an Internal Source, such as in VXT

7.3.12 Screen Image

Selects a file for saving the contents of the display.

Screen Image files are PNG (Portable Network Graphics) files with the same resolution as the data display. They contain the image that was on the screen before you opened the **Save** dialog. When the **Screen Image** key is pressed, a "thumbnail" of the captured image is displayed, with the note "This is the image that will be saved" below it.

After you have completed the save, a message "File image.png saved" (assuming `image.png` was the filename you used).

NOTE

As of firmware release A.17.50, sending `*CLS` (Clear Status) removes any message displayed on the screen. If you do not want to see the "File saved" message after sending `:MMEM:STOR:SCR` (described below), send the following sequence (substituting your file name for `filename.png`): `:MMEM:STOR:SCR "filename.png";*CLS`

NOTE

As of firmware release A.19.50, saving a screen image will remove any informational message displayed on the screen before it captures the screen. This is useful if you are sending “save image” commands in rapid sequence, as it keeps the “File saved” message from one screen capture from appearing in the next screen capture. Error messages will still be captured.

If you send a succession of screen image commands *too* rapidly, the system may not have time to remove the previous message before the next screen capture. Sending screen image commands more rapidly than twice per second is not advised.

The default path for State Files is:

`My Documents\<mode name>\screen`

where `<mode name>` is the parameter used to select the mode with `:INST:SEL`, for example, `SA` for Spectrum Analyzer Mode.

Screen Image files have extension `.png`. The default filename is `Screen_0000.png`, where the 4-digit number is the lowest number that does not conflict with any filename in the current directory.

After you have completed the save, the **Quick Save** front-panel key lets you quickly repeat the last save performed, using an auto-named file, with new current screen data.

Remote Command	<code>:MMEMory:STORe:SCReen <filename></code>
Example	<code>:MMEM:STOR:SCR "myScreen.png"</code> This stores the current screen image in the file <code>MyScreenFile.png</code> in the default directory
Backwards Compatibility SCPI	<code>:HCOpy:SDUMp:DATA?</code> returns the screen image in a <code><DEFINITE LENGTH ARBITRARY RESPONSE DATA></code> element. The response data is IEEE Block format; the controlling computer can strip the header and store the result as a <code>.png</code> file

Blocking Screen Capture (Remote Command Only)

This command works *only* when the measurement is in **Single** mode (see ["Sweep/Measure" on page 2681](#)). When the command is sent, it blocks the SCPI client, waits for the current refresh to complete, then captures the screen shot and saves it. In some instances, a single measurement is taken, and a screen shot of that measurement is captured.

This command ensures that the last-measured data is refreshed on the screen before it is captured, by blocking the command and waiting for refresh to complete. The command may time out, in which case it must be re-sent.

If timeout occurs, or if the active measurement is in **Continuous** mode, an error is returned.

Remote Command	:MMEMory:STORe:SCReen:BLORked <filename>
Example	:MMEM:STOR:SCR:BLOC "myScreen.png"
	The command waits for the current screen refresh to complete before capturing the screen shot. This stores the current screen image in the file MyScreenFile.png in the default directory

7.3.12.1 Theme

Accesses a menu of functions that enable you to choose the theme to be used when saving the screen image. You can choose between themes to be used when saving the screen image.

See "[More Information](#)" on page 3240 for examples of the themes.

Remote Command	:MMEMory:STORe:SCReen:THEMe FILLed OUTLine
Example	:MMEM:STOR:SCR:THEM OUTL
Preset	FILLed; not part of Preset, but is reset by Restore Misc Defaults or Restore System Defaults All
Backwards Compatibility SCPI	:MMEMory:STORe:SCReen:THEMe TDCoLor TDMonochrome FCOLor FMONochrome
Backwards Compatibility Notes	<p>To permit code compatibility with A-model X-Series Signal Analyzer instruments, the command parameters from the A-models will be mapped as follows:</p> <p>TDCoLor and TDMonochrome are both mapped to FILLed (exact full color representation of what is on the screen)</p> <p>FCOLor and FMONochrome are both mapped to OUTLine (uses color for traces and other items, but most filled areas are white)</p> <p>There is no Monochrome theme in B-models so the A-models monochrome commands yield color</p> <p>:MMEM:STOR:SCR:THEM? always returns FILLed or OUTLine, never FCOLor, FMONochrome, TDCoLor, or TDMonochrome</p> <p>There is no monochrome theme in the X-Series Touch UI</p>

More Information

- The **FILLed** theme is an exact representation of the information on the display
- The **OUTLine** theme eliminates most of the filled areas, in order to save ink when the image is printed. In addition, the yellow trace color is changed to be more orange, to improve visibility against a white background. Note that some objects remain filled. In particular, the selected marker remains filled with the

green marker color, in order to distinguish it from the other markers. This is important, as it is the selected marker whose readout appears in the upper right corner of the display

7.3.13 Power Sensor Cal Factor

Selects a file to which to export the Power Sensor Cal factor data.

Cal Factor files are XML files, and contain the cal factor data and header data that gives information on the power sensor.

The default path for Cal Factor Files is:

`My Documents\<mode name>\data\PSCF`

where `<mode name>` is the parameter used to select the mode with `:INST:SEL` (for example, `MRECEIVE` for Measuring Receiver Mode). Hence, a Cal Factor file from any measurement in the Measuring Receiver mode would be stored in:

`My Documents\MRECEIVE\data\PSCF`

Cal Factor files have the extension `.xml`. The default filename is `<Sensor Model>_<Sensor Serial Number>_0000.xml`, where the 4-digit number is the lowest number that does not conflict with any filename in the current directory. If the sensor model or serial number is blank, the default filename is `PSCF_0000.xml`.

Remote Command	<code>:MMEMory:STORe:PSCFactor <file_name></code>
Example	<code>:MMEM:STOR:PSCF "myPSCF.xml"</code>
Notes	If the save is initiated via SCPI, and the file already exists, the file will be overwritten Using the C: drive is strongly discouraged, since it runs the risk of being overwritten during an instrument software upgrade Both single and double quotes are supported for any filename parameter over SCPI
Dependencies	Only appears if you have the proper option installed in your instrument

7.3.14 Recording

Lets you save to a file data being acquired by the measurement, so that it can later be recalled and played back as though it were coming from the Input.

You may specify a data type (for example, I/Q data) and choose a file to which to save the data.

The Recording and Playback of signal data files is a multi-step process that involves controls in several menus.

The menus that are involved in Record/Playback are:

- **Save, Recording** (this menu)
- **Recall, "Recording" on page 3207** (under the **Recall** hardkey or the **Recall** icon in the **File** panel)
- **Sweep, Recording** tab
- **Sweep, Playback** tab
- **Input/Output, "Data Source" on page 3063** tab

NOTE

A complete tutorial for the Record/Playback functionality, including how to load and save Recording files, can be found under the **Data Source** tab in **Input/Output**.

Dependencies	<p>Only available in the following Modes and measurements:</p> <ul style="list-style-type: none"> – VMA (Digital Demod and Custom OFDM) – 5G NR (Modulation Analysis) – LTE (Modulation Analysis) – WLAN (Modulation Analysis, MIMO Modulation Analysis, Spectral Flatness) – Analog Demod – Bluetooth (Transmit Analysis) – IoT & SRComms (LoRa CSS Demod)
--------------	--

7.3.14.1 Data Type

Allows you to save IQ data from the measurement using a specified file type (CSV, SDF, TXT, BIN, BINX, BINF, ORB).

CSV	Comma-Separated Values. Excel compatible format. Plain text roughly three times the size of BINF
TXT	Text format. Plain text roughly three times the size of BINF
SDF	Format developed for Keysight 89600 VSA Software. Note that due to differences in the internal file structure, SDF files saved by X-Series are not guaranteed to work perfectly with 89600
BIN	<p>Interleaved 16-bit Q15 signed IQ file, in Big Endian format. Q15 is a DSP format in which the most significant bit is the sign bit, followed by 15 bits of fraction. The Q15 number has a decimal range between -32768 and -32767. The data is scaled to fit within this decimal range</p> <p>BIN files do not include sampling rate information inside the file, there will be associated txt file including sampling rate and scaling information</p>

7 Save/Recall/Print
7.3 Save

BINX	Interleaved 16-bit Q15 signed IQ file, in Little Endian format. The data is scaled to fit within the decimal range BINX files do not include sampling rate information inside the file, there will be associated txt file including sampling rate and scaling information
BINF	32-bit IEEE 754 floating-point number in Little Endian format. The data is raw IQ data BINF files do not include sampling rate information inside the file, there will be associated txt file including sampling rate information
ORB	Format developed for Keysight ORAN Studio. This format is only supported by 5G NR Modulation Analysis measurement

Example `:MMEM:STOR:RECORDING "C:\TEMP\MyIQData.csv"`

7.3.14.2 Channel

Select data channels to save. This is only supported by 5G NR Mode's EVM, VMA Digital Demod, VMA Custom OFDM measurements, and by WLAN Mode's MIMO EVM measurement.

The `<meas>` param in the command must be replaced with the node of the active measurement:

Parameter	Mode	Measurement
EVM	5G NR	EVM
EVMM	WLAN	MIMO EVM
DDEM	VMA	Digital Demod
OFDM	VMA	Custom OFDM

Remote Command `:MMEMory:STOR: <meas>:RECORDING:CHANnel ALL | CH1 | CH2 | CH3 | CH4 | CH5 | CH6 | CH7 | CH8`
`:MMEMory:STOR: <meas>:RECORDING:CHANnel?`

Example `:MMEM:STOR:EVM:REC:CHAN CH1`
`:MMEM:STOR:EVM:REC:CHAN?`

Preset `ALL`

State Saved `No`

Range `ALL | CH1 | CH2 | CH3 | CH4 | CH5 | CH6 | CH7 | CH8`

7.3.15 Recording + State

You can Save State and IQ recording into a snapshot file (`*.rssf`).

Remote Command `:MMEMory:STOR:RState <filename>`

Example	<code>:MMEM:STOR:RST "snapshot1.rssf"</code>
---------	--

Status Bits/OPC dependencies	Sequential - aborts the current measurement
------------------------------	---

7.3.16 Component Carrier Setup

You can save component carrier setup (Meas Setup – Component Carriers/Channel Profile) to a file.

You can specify which component carrier to which you wish to save its setup, or “all”, using the Component Carrier dropdown.

The following file formats are supported:

- X-Series Measurement Application 5G NR Component Carrier Setup Files (*.nrcc)

Remote Command	<code>:MMEMory:STORe:EVM:SETup <string></code>
----------------	--

Example	<code>:MMEM:STOR:EVM:SET "mySetup.nrcc"</code>
---------	--

Status Bits/OPC dependencies	Sequential - aborts the current measurement
------------------------------	---

For X-Series Measurement Application 5G NR Component Carrier Setup Files (*.nrcc), the settings below are saved/recalled:

- Mode Level
 - Number of Component Carriers (Meas Setup – Component Carriers)
 - Direction (Meas Setup – Radio)
 - Freq Offset (Meas Setup – Component Carriers – Configure Comp Carriers – Configure CCs)
 - Freq Range (Meas Setup – Component Carriers – Configure Comp Carriers – Configure CCs)
 - Bandwidth (Meas Setup – Component Carriers – Configure Comp Carriers – Configure CCs)
 - Measure Carrier (Meas Setup – Component Carriers – Configure Comp Carriers – Configure CCs)
- Meas Level
 - MIMO (Meas Setup – Radio)
 - Spectrum (Meas Setup – Component Carriers – Configure Comp Carriers – Configure CCs)

- Cell ID Auto (Meas Setup – Component Carriers – Configure Comp Carriers – Configure CCs)
- Cell ID Value (Meas Setup – Component Carriers – Configure Comp Carriers – Configure CCs)
- Configuration Mode (Meas Setup – Component Carriers – Configure Comp Carriers – Resource Grid)
- Enabled (Meas Setup – Component Carriers – Configure Comp Carriers – Resource Grid)
- N_grid_start (Meas Setup – Component Carriers – Configure Comp Carriers – Resource Grid)
- N_grid_size (Meas Setup – Component Carriers – Configure Comp Carriers – Resource Grid)
- Channel profile settings (Meas Setup – Channel Profile – Control and User Channels)

7.3.17 Remote Only Commands

The following commands execute file system operations such as move, copy and transfer data from a file.

7.3.17.1 Mass Storage Catalog (Remote Command Only)

Remote Command	<code>:MMEMory:CATalog? [<directory_name>]</code>
Example	<code>:MMEM:CAT? "C:\"</code>
Notes	<p>The string <code><directory_name></code> must be a valid logical path. If no string then it uses the current directory</p> <p>Queries disk usage information (drive capacity, free space available) and obtains a list of files and directories in a specified directory in the following format:</p> <pre><numeric_value>,<numeric_value>,\{<file_entry>\}</pre> <p>It returns two numeric parameters and as many strings as there are files and directories</p> <p>The first parameter indicates the total amount of storage currently used in bytes</p> <p>The second parameter indicates the total amount of storage available, also in bytes. <code><file_entry></code> is a string. Each <code><file_entry></code> indicates the name, type, and size of one file in the directory list:</p> <pre><file_name>,<file_type>,<file_size></pre> <p>As the Windows file system has an extension that indicates file type, <code><file_type></code> is always empty. <code><file_size></code> provides the size of the file in bytes. For directories, <code><file_entry></code> is surrounded by square brackets and both <code><file_type></code> and <code><file_size></code> are empty</p>

7.3.17.2 Mass Storage Change Directory (Remote Command Only)

Remote Command	<code>:MMEMory:CDIRectory [<directory_name>]</code>
Example	<code>:MMEM:CDIR "C:\Program Files"</code>
Notes	<p>The string must be a valid logical path</p> <p>Changes the current directory for a mass memory file system. The <code><directory_name></code> parameter is a string. If no parameter is specified, the directory is set to the <code>*RST</code> value</p> <p>At <code>*RST</code>, this value is set to the default user data storage area, that is defined as <code>System.Environment.SpecialFolder.Personal</code></p> <p>Query returns full path of the current directory as a quoted string</p>

7.3.17.3 Mass Storage Copy (Remote Command Only)

Remote Command	<code>:MMEMory:COPY <string>,<string>[,<string>,<string>]</code>
Example	<code>:MMEM:COPY "C:\TEMP\Screen_0000.png", "C:\\"</code>
Notes	<p>The string must be a valid logical path</p> <p>Copies an existing file to a new file or an existing directory to a new directory</p> <p>If no directory is specified, uses the current directory</p> <p>Two forms of parameters are allowed. The first form has two parameters. In this form, the first parameter specifies the source, and the second parameter specifies the destination</p> <p>The second form has four parameters. In this form, the first and third parameters specify the source. The second and fourth parameters specify the directories. The first pair of parameters specifies the source. The second pair specifies the destination. An error is generated if the source doesn't exist or the destination file already exists</p> <p>This command will generate an "access denied" error if the destination is a restricted folder (for example, <code>C:\Windows</code>) and you do not have Power User or Administrator privileges</p>

7.3.17.4 Mass Storage Device Copy (Remote Command Only)

Transfers data to/from a file and a peripheral device.

Remote Command	<code>:MMEMory:COPY:DEVIce <source_string>,<dest_string></code>
Notes	<p>The strings must be a valid logical path or a valid device keyword. If <code>dest_string</code> is a device keyword, the data is copied from the source file to the device. If <code>source_string</code> is a device keyword, the data is copied to the source file from the device</p> <p>Valid device keywords are:</p> <p><code>SNS</code> (smart noise source)</p> <p>An error is generated if the file or device is not found</p>

7.3.17.5 Mass Storage Delete (Remote Command Only)

Remote Command	<code>:MMEMory:DELeTe <file_name>[,<directory_name>]</code>
Example	<code>:MMEM:DEL "Screen_0000.png"</code>
Notes	The string must be a valid logical path If no directory is specified, uses the current directory Removes a file from the specified directory. <code><file_name></code> specifies the file name to be removed. This command generates an “access denied” error if the file is in a restricted folder (for example, <code>C:\Windows</code>) and you do not have Power User or Administrator privileges

7.3.17.6 Mass Storage Data (Remote Command Only)

Creates a file containing the specified data *or* queries the data from an existing file.

Remote Command	<code>:MMEMory:DATA <file_name>, <data></code> <code>:MMEMory:DATA? <file_name></code>
Example	<code>:MMEM:DATA? "MyFile.txt"</code>
Notes	The string must be a valid logical path If no directory is specified, uses the current directory The command form <code>:MMEMory:DATA <file_name>,<data></code> loads <code><data></code> into the file <code><file_name></code> . <code><data></code> is in 488.2 block format. <code><file_name></code> is string data The response to <code>:MMEMory:DATA? <file_name></code> is the associated <code><data></code> in block format

7.3.17.7 Mass Storage Make Directory (Remote Command Only)

Remote Command	<code>:MMEMory:MDIRectory <directory_name></code>
Example	<code>:MMEM:MDIR "C:\TEMP\NewDir"</code>
Notes	The string must be a valid logical path Creates a new directory. The <code><directory_name></code> parameter specifies the name to be created Generates an “access denied” error if the new directory would be in a restricted folder (for example, <code>C:\Windows</code>) and you do not have Power User or Administrator privileges

7.3.17.8 Mass Storage Move (Remote Command Only)

Remote Command	<code>:MMEMory:MOVE <string>,<string>[,<string>,<string>]</code>
----------------	--

Example	<code>:MMEM:MOVE "C:\TEMP\Screen_0000.png", "C:\"</code>
Notes	<p>The string must be a valid logical path</p> <p>Moves an existing file to a new file or an existing directory to a new directory</p> <p>Two forms of parameters are allowed. The first form has two parameters. In this form, the first parameter specifies the source, and the second parameter specifies the destination</p> <p>The second form has four parameters. In this form, the first and third parameters specify the source. The second and fourth parameters specify the directories. The first pair of parameters specifies the source. The second pair specifies the destination. An error is generated if the source doesn't exist or the destination file already exists</p> <p>This command generates an "access denied" error if the destination is a restricted folder (for example, <code>C:\Windows</code>) and you do not have Power User or Administrator privileges</p>

7.3.17.9 Mass Storage Remove Directory (Remote Command Only)

Remote Command	<code>:MMEMory:RDIrectory <directory_name></code>
Example	<code>:MMEM:RDIR "C:\TEMP\NewDir"</code>
Notes	<p>The string must be a valid logical path</p> <p>Removes a directory. The <code><directory_name></code> parameter specifies the directory name to be removed. All files and directories under the specified directory will also be removed</p> <p>This command generates an "access denied" error if the folder is a restricted folder (for example, <code>C:\Windows</code>) or is in a restricted folder and you do not have Power User or Administrator privileges</p>

7.3.17.10 Mass Storage Determine Removable Media (Remote Command Only)

Used to determine whether any removable media devices are connected to the instrument. Primarily, these are USB memory devices plugged-in to the front panel or rear panel USB ports. On instruments with PC6 or PC7 CPUs, one SD card slot is available for removable media. The instrument's primary disk drive is *not* a removable media device.

Remote Command	<code>:MMEMory:RMEDia:LIST?</code>
Example	<code>:MMEM:RMED:LIST?</code>
Notes	<p>The return value is a string containing a list of partition identifiers, which are removable media devices. Each identifier will be separated by a comma. If no removable media is present, an empty string is returned</p> <p>Examples:</p> <ul style="list-style-type: none"> - One removable device present results in a return string of "F:" - Two removable devices present results in a return string of "F:,G:" <p>No removable devices present results in a return string of ""</p>

7.3.17.11 Mass Storage Determine Removable Media Label (Remote Command Only)

Used to set or query a removable media device's label.

Remote Command	<code>:MMEMory:RMEDia:LABel <partition>,<string></code> <code>:MMEMory:RMEDia:LABel? <partition></code>
Example	<code>:MMEM:RMED:LAB "F:","My Device"</code>
Notes	If the <code><partition></code> specified does not exist or is not a removable media device, the error -252, "Missing Media" is generated Setting the removable media label requires Administrative privileges. If the currently logged-in user does not have appropriate privileges, error "-221, Settings conflict; Administrator privileges required" is generated

7.3.17.12 Mass Storage Determine Removable Media Write-protect status (Remote Command Only)

Used to query a removable media device's write-protect status.

Remote Command	<code>:MMEMory:RMEDia:WPRotect? <partition></code>
Example	<code>:MMEM:RMED:WPR? "F:"</code>
Notes	The return value is 1 if the device is write-protected, and 0 if the device is write-enabled If the <code><partition></code> specified does not exist or is not a removable media device the error -252, "Missing Media" is generated
Preset	The return value depends on the SD card installed

7.3.17.13 Mass Storage Determine Removable Media size (Remote Command Only)

Used to query a removable media device's total memory size (not available memory size).

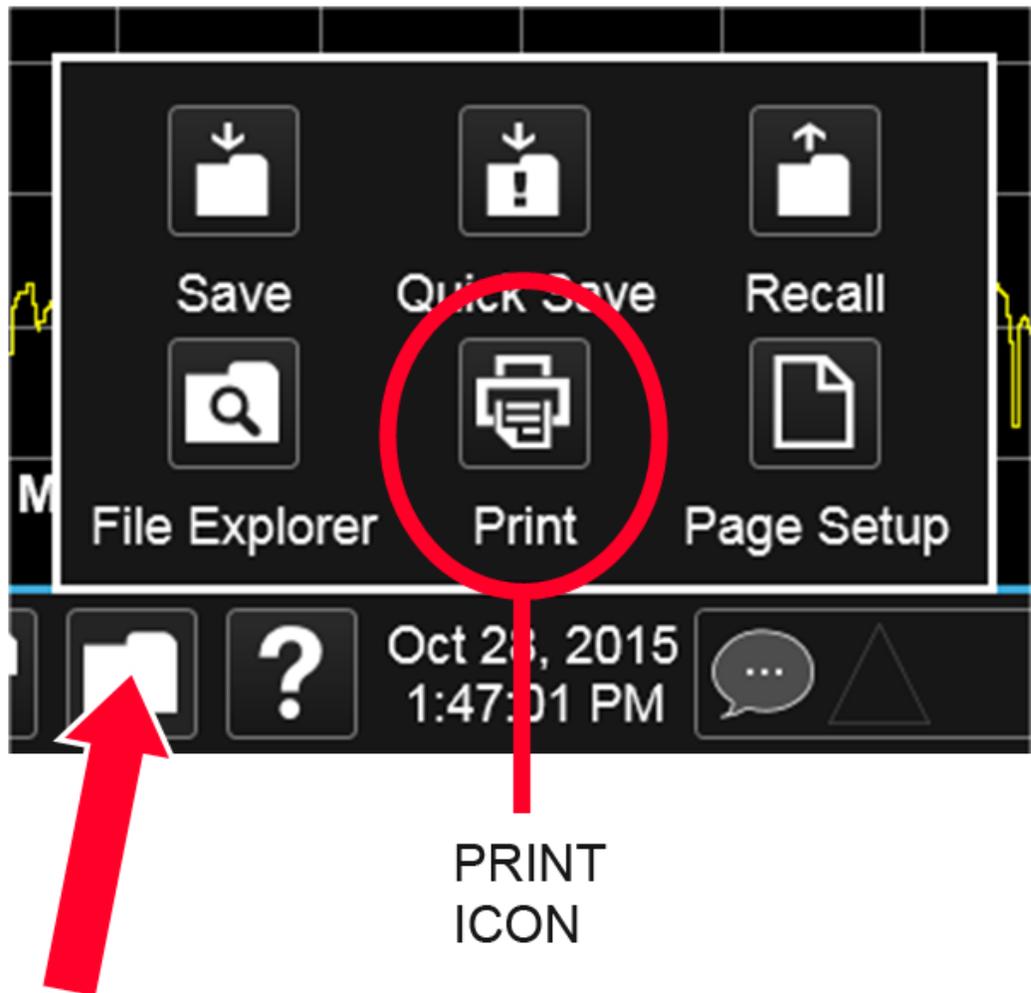

Remote Command	<code>:MMEMory:RMEDia:SIZE? <partition></code>
Example	<code>:MMEM:RMED:SIZE? "F:"</code>
Notes	The return value is integer value in GBytes. Any device that is less than 1 GB returns 0 GB If the <code><partition></code> specified does not exist or is not a removable media device, the error -252, "Missing Media" is generated

7.3.17.14 :SYSTem:SET (Remote Command Only)

Obtains the state of the currently active mode in a form that can then be loaded back into the instrument quickly.

Remote Command	<pre>:SYSTem:SET <instrument state in IEEE Block> :SYSTem:SET?</pre>
Notes	<p>The query returns current instrument state of the active mode in IEEE Block data format. The state is in a machine readable format only, as follows:</p> <pre><syst set preamble><state block data></pre> <p>Where:</p> <p><syst set preamble> is the format:</p> <pre>#NMMM</pre> <ul style="list-style-type: none"> - N = number of digits that comprise MMM - MMM = length in bytes of following data <p><state block data> is machine readable state data</p> <p>Example response: #42016<state data></p> <p>The state is recalled by sending the :SYST:SET? response data to the instrument. From example above: :SYST:SET #42016<state data></p>

7.4 Print

Opens a dialog for configuring printing (for example, to the printer of your choice).

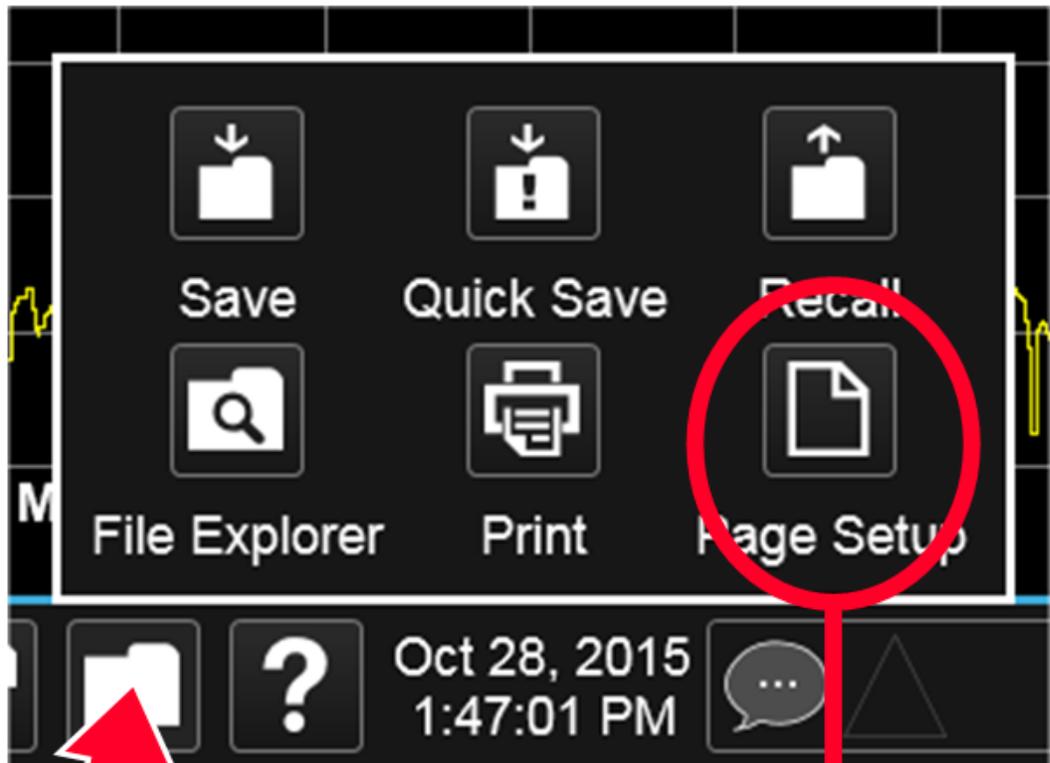

The `:HCOPY` command is equivalent to pressing the **PRINT** key.

Remote Command `:HCOPY[:IMMEDIATE]`

`:HCOPY:ABORT` can be used to abort a print that is already in progress. Sending `:HCOPY:ABORT` causes the instrument to stop sending data to the printer, although the printer may continue or even complete the print, depending on how much data was sent to the printer before you sent the `:ABORT` command.

Remote Command `:HCOPY:ABORT`

7.5 Page Setup

PAGE SETUP
ICON

Opens a Windows Page Setup dialog that allows you to control aspects of the pages sent to the printer when the **PRINT** hardkey is pressed.

Depending on the abilities of the attached printer, paper size, paper source, page orientation and margins may all be set. There are no SCPI commands for controlling these parameters.

Also in this dialog is a dropdown control that lets you select the Display Theme to use when printing. Page Setup themes are the same as those available for Screen Image ["Theme" on page 3240](#).

The **Theme** control has a corresponding SCPI command:

7 Save/Recall/Print
7.5 Page Setup

Remote Command	<code>:SYSTem:PRINt:THEMe FILLed OUTLine</code>
Example	<code>:SYST:PRIN:THEM OUTL</code>
Preset	OUTL ; not part of Preset, but is reset by Restore Misc Defaults or Restore System Defaults All and survives subsequent running of the modes
State Saved	No
Backwards Compatibility SCPI	<code>:SYSTem:PRINt:THEMe TDCoLor TDMonochrome FCOLor FMONochrome</code>
Backwards Compatibility Notes	<p>To permit code compatibility with A-model X-Series Signal Analyzer instruments, the command parameters from the A-models are mapped as follows:</p> <p>TDCoLor and TDMonochrome are both mapped to FILLed (exact full color representation of what is on the screen)</p> <p>FCOLor and FMONochrome are both mapped to OUTLine (uses color for traces and other items, but most filled areas are white)</p> <p>There is no Monochrome theme in B-models, so the A-models monochrome commands yield color</p> <p><code>:SYST:PRINT:THEM?</code> always returns FILLed or OUTLine; never FCOLor, FMONochrome, TDCoLor, or TDMonochrome</p>

8 Trigger

Controls the **Trigger** system of the instrument. In general, these are functions associated with internal triggers or trigger inputs. Trigger Output functions are configured under **Input/Output**.

Trigger functions are common across multiple Modes and Measurements, although some controls appear only in certain Modes and/or certain Measurements. Additionally, some of the tabs on the **Trigger** menu are only available in certain Modes.

Many of the Trigger functions can be set graphically using the Trigger Setting Diagram. For more information see: "[Trigger Optimization](#)" on page 3299

In general, each Measurement can have a different Trigger, and each Measurement remembers its previous-trigger setting.

8.1 Trigger

Contains controls that let you select the trigger source, and setup of each of the trigger sources. The instrument is designed to allow triggering from many sources, for example, Free Run, Video, External, RF Burst, etc.

In general, each Measurement can have a different Trigger Source, and each Measurement remembers its previous-Trigger Source.

8.1.1 Select Trig Source

Specifies the trigger source for the currently selected instrument input (RF or I/Q). If you change inputs, the new input remembers the trigger source it was last programmed to for the current measurement, and uses that trigger source. When in External Mixing, the instrument uses the RF trigger source. You can directly set the trigger source for the RF Input and for the I/Q input using SCPI commands; see ["Trigger Source Presets" on page 3263](#), ["RF Trigger Source \(Remote Command Only\)" on page 3265](#), and ["I/Q Trigger Source \(Remote Command Only\)" on page 3267](#).

In general, each Measurement can have a different Trigger Source, and each Measurement remembers its previously-set Trigger Source. Not every Trigger Source is available for every Measurement, so the available choices for Select Trig Source may vary from Mode to Mode and Measurement to Measurement. The trigger sources that are available for each measurement are shown in the "List of Available Trigger sources" dropdown below.

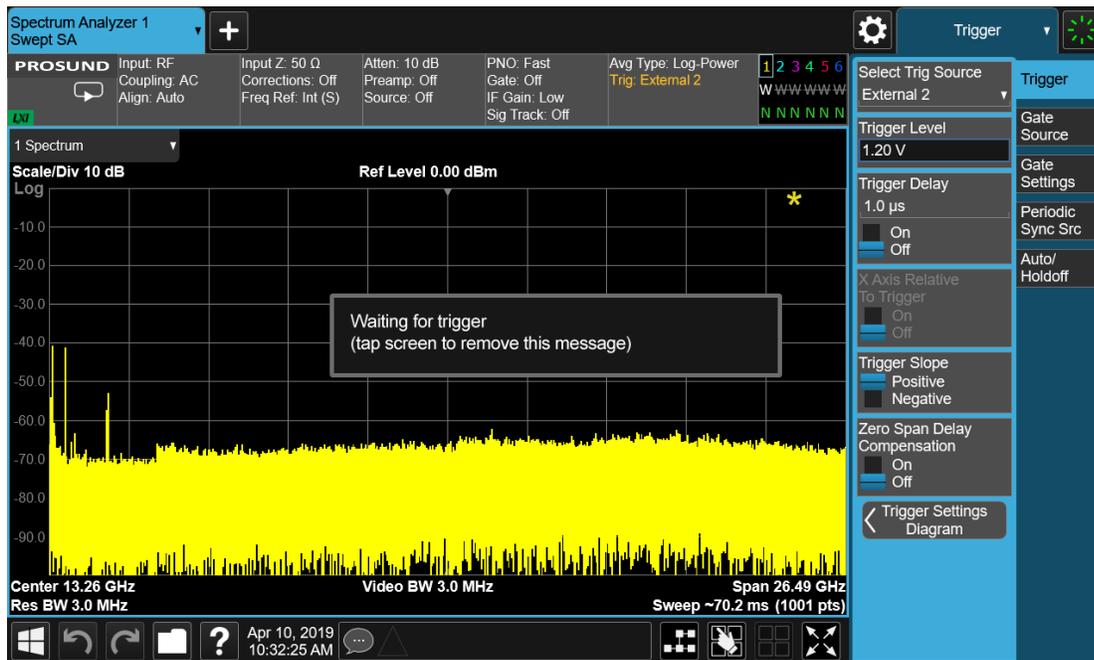

Note that the controls available on the Trigger Tab change depending on which trigger source is selected. Tap each trigger source in the table in the "List of Available Trigger sources" dropdown to see what parameters are available for that trigger source.

Note that most measurements require the inclusion of a `<measurement>` parameter in the Trigger Source command. However, for the Swept SA measurement and RTSA this is not the case; for backwards compatibility, no `<measurement>` parameter is used when setting the Trigger Source for the Swept SA measurement or RTSA.

Waiting for Trigger

After you select a trigger source, the instrument will start its next measurement when that trigger source is satisfied. For example, if you choose External 1, the next measurement will start when the appropriate signal appears at the Trigger 1 In connector.

If the trigger source is not satisfied (for example, if no signal at the appropriate level appears at the Trigger 1 In connector), after approximately 2 seconds a popup message will appear that says “Waiting for trigger”. The trigger annotation in the Meas Bar will also turn amber, as shown below:

Tap anywhere on the screen (except on the message itself) to clear the popup. The annotation will remain amber until the trigger conditions are satisfied.

List of available Trigger sources

The tables show which Trigger sources are available for which Modes and Measurements, with the following exceptions:

- the Noise Figure Mode does not support Triggering at all
- the Disturbance Analyzer measurement in the EMI Mode does not support Triggering
- the Tx Band Spur measurement in the GSM/EDGE Mode does not support Triggering
- For some models (like SP900S) with ADC trigger: some IF Paths do not support Video trigger, instead they support ADC trigger

Source	Keyword	Modes & Measurements
"Free Run" on page 3268	IMMediate	All Modes and measurements, except those measurements that support no triggers at all

8 Trigger
8.1 Trigger

Source	Keyword	Modes & Measurements
"Video/ADC" on page 3268	VIDeo	All Modes except RTSA and Pulse <ul style="list-style-type: none"> - In SA Mode, all measurements except ACP and List Sweep - In WCDMA, MSR, Short Range Comms, VMA and LTE, all measurements except ACP - In Phase Noise, all measurements except Log Plot and Spot Frequency
"ADC Trigger" on page 3269	ADC	All Modes and measurements supporting Video, except SA Mode Only supported in certain model's IF Paths
"Line" on page 3269	LINE	All Modes except EMI, Avionics and Analog Demod <ul style="list-style-type: none"> - In SA Mode, all measurements except List Sweep - In WLAN and GSM/EDGE, all measurements except Power vs. Time - In LTE and 5G NR, all measurements except Transmit On/Off Power - In Short Range Comms, all measurements except Modulation Analysis
"External 1" on page 3270	EXTernal1	All Modes and measurements
"External 2" on page 3271	EXTernal2	All Modes and measurements
"External 3" on page 3271	EXTernal3	See "External 3 Support" on page 3258
"RF Burst" on page 3273	RFBurst	All Modes except EMI <ul style="list-style-type: none"> - In SA Mode, all measurements except List Sweep
"Periodic" on page 3273	FRAMe	All Modes except EMI <ul style="list-style-type: none"> - In SA Mode, all measurements except List Sweep

I/Q Triggers:

Source	Keyword	Models, Modes & Measurements
"I/Q Mag" on page 3275	IQMag	All Modes except EMI, Avionics, RTSA, Analog Demod and Pulse <ul style="list-style-type: none"> - In SA Mode, only in Power Stat CCDF and Burst Power
"Input I" on page 3276	IINPut	<ul style="list-style-type: none"> - In WCDMA, only in Power Stat CCDF and IQ Waveform - In GSM/EDGE, only in EVM, GMSK Phase & Freq Error, Transmit Power and IQ Waveform
"Input Q" on page 3276	QINPut	<ul style="list-style-type: none"> - In Phase Noise, only in IQ Waveform - In Bluetooth, only in Transmit Analysis
"I (Demodulated)" on page 3277	IDEMod	<ul style="list-style-type: none"> - In LTE, only in Power Stat CCDF, Modulation Analysis, Conformance EVM, and IQ Waveform - In WLAN, only in Power Stat CCDF, Modulation Analysis, Spectral Flatness, and IQ Waveform
"Q (Demodulated)" on page 3277	QDEMod	<ul style="list-style-type: none"> - In Short Range Comms, only in Power Stat CCDF and Modulation Analysis
"Aux I/Q Mag" on page 3278	AIQMag	<ul style="list-style-type: none"> - In VMA, only in Power Stat CCDF, Digital Demod and IQ Waveform - In CQM, only in Group Delay, Power Stat CCDF, and IQ Waveform
"PXI" on page 3278	PXI	All Modes and measurements (only found in modular analyzers)
"Internal" on page 3279	INTernal	All Modes and measurements (only found in modular analyzers)
"Audio External" on page 3272	AEXTernal	Via the TRIG IN connector on the M9260A Audio Analyzer module
"Prot Channel Detection" on page 3279	PRTChandet	Base Station Emulation; valid UL signal detected (PUSCH/PUCCH/PRACH/SRS)
"Prot Frame Aligned" on page 3280	PRTFrame	Base Station Emulation; periodic technology format radio frame with data frame aligned to the BSE timing
"Prot Event" on page 3280	PRTEvent	Base Station Emulation events

External 3 Support

Trigger Source **External 3** is available only in certain Modes and measurements, as follows:

Mode	Measurements
5GNR	Transmit On Off, Modulation Analysis, Power Stat CCDF, and IQ Waveform measurements only

8 Trigger
8.1 Trigger

Mode	Measurements
ADEMODO	Not supported
AVIONICS	Not supported
BT	Not supported
CQM	Group Delay, Power Stat CCDF, and IQ Waveform measurements only
EMI	Not supported
GSMEDGE	IQ Waveform and Transmit Power measurements only
LTEAFDD, LTEATDD	Power Stat CCDF, IQ Waveform, and Transmit On Off measurements only
MSR	Power Stat CCDF, and IQ Waveform measurements only
PA	Power Amplifier measurement
PNOISE	IQ Waveform measurement only
PULSEX	Pulse measurement only
SA	Power Stat CCDF and Burst Power measurements only
SRCOMMS	Modulation Analysis, Power Stat CCDF, and IQ Waveform measurements only
VMA	Digital Demod, Custom OFDM, IQ Waveform, and Power Stat CCDF measurements only
WCDMA	QPSK EVM, Power Stat CCDF, and IQ Waveform measurements only
WLAN	Spectral Flatness, Modulation Analysis, Power Vs Time, Power Stat CCDF, and IQ Waveform measurements only

Backwards Compatibility SCPI

The following commands are provided for Backwards Compatibility:

Backwards Compatibility SCPI	<p>:TRIGger[:SEquence]:SOURCe EXTernal</p> <p>For backwards compatibility, the parameter EXTernal is mapped to EXTernal1</p> <p>[:SENSe]:<measurement>:TRIGger:SOURce</p> <p>Provided for ESA/PSA compatibility</p> <p>This command does not apply to the Swept SA measurement, for that just use :TRIGger:SOURce</p> <p>This command does not apply to the Monitor Spectrum, Log Plot and Spot Frequency measurements</p> <p>[:SENSe]:<measurement>:TRIGger:SOURce IF</p> <p>In earlier instruments, the parameter IF was used by apps for the video trigger, so using the IF parameter selects VIDeo triggering. Sending IF in the command causes VID to be returned to a query</p> <p>[:SENSe]:ACPR:TRIGger:SOURce</p> <p>This command is provided to support the same functionality as [:SENSe]:ACPr:TRIGger:SOURce (PSA W-CDMA, PSA cdma2000 and PSA 1xEVDO) due to the fact that the ACPr node conflicts with the ACPower node</p> <p>The legacy command:</p> <p>:TRIGger[:SEquence]:RFBurst:FSElectivity[:STATe] OFF ON 0 1</p>
------------------------------------	---

is *not* supported in X-Series, as the hardware to do Frequency Selective burst triggers does not exist in X-Series

More Information

The **Trigger** menus let you select the trigger source and trigger settings for a sweep or measurement. In triggered operation (basically, any trigger source other than Free Run), the instrument will begin a sweep or measurement only when the selected trigger conditions are met, generally when your trigger source signal meets the specified trigger level and polarity requirements. (In FFT measurements, the trigger controls when the data acquisition begins for FFT conversion.)

For each of the trigger sources, you may define a set of operational parameters or settings, which will be applied when that source is selected as the current trigger source. Examples of these settings are Trigger Level, Trigger Delay, and Trigger Slope. You may apply different settings for each source; so, for example, you could have a Trigger Level of 1v for External 1 trigger and -10 dBm for Video trigger.

Once you have established the settings for a given trigger source, they generally will remain unchanged for that trigger source as you go from measurement to measurement within a Mode (although the settings can change as you go from Mode to Mode). Furthermore, the trigger settings within a Mode are the same for the **Trigger** menu, the **Gate Source** menu, and the **Periodic Sync Src** menu. That is, if **Ext1** trigger level is set to 1v in the **Trigger** menu, it will appear as 1v in both the **Gate Source** and the **Periodic Sync Src** menus. For these reasons the trigger settings commands are not qualified with the measurement name, the way the trigger source commands are.

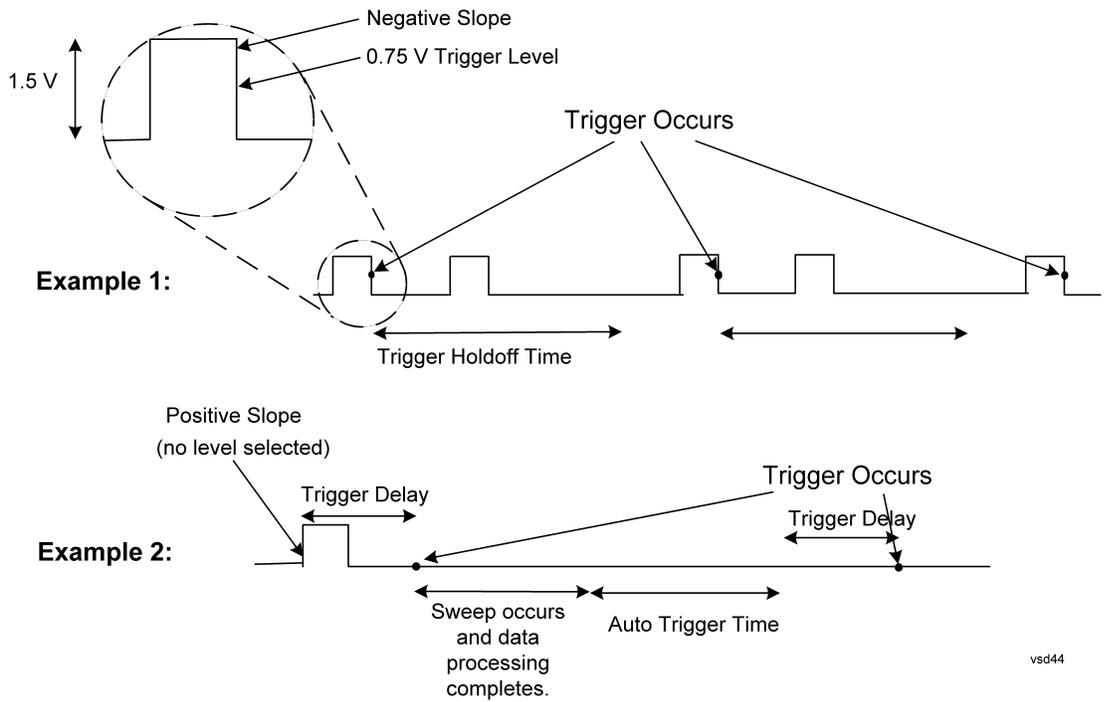

Trigger Setup Parameters:

The following examples show trigger setup parameters using an external trigger source.

Example 1 illustrates the trigger conditions with negative slope and no trigger occurs during trigger Holdoff time.

Example 2 illustrates the trigger conditions with positive slope, trigger delay, and auto trigger time.

8 Trigger
8.1 Trigger

Remote Command Swept SA and RTSA measurements:
`:TRIGger[:SEquence]:SOURce EXTernal1 | EXTernal2 | EXTernal3 | IMMEDIATE | LINE | FRAME | RFBurst | VIDEO | TV | PXI | INTERNAL`
`:TRIGger[:SEquence]:SOURce?`

All other measurements
`:TRIGger:<measurement>[:SEquence]:SOURce EXTernal1 | EXTernal2 | EXTernal3 | AEXTernal | IMMEDIATE | LEVEL | FMT | LINE | ADC | FRAME | RFBurst | VIDEO | IQMag | IDEMod | QDEMod | IINPut | QINPut | AIQMag | PXI | INTERNAL | PRTChandet | PRTFrame | PRTEvent`
`:TRIGger:<measurement>[:SEquence]:SOURce?`

Example The following commands set the External 1 trigger input for various measurements

Swept SA and RTSA measurements:
`:TRIG:SOUR EXT1`

Other Spectrum Analyzer Mode measurements:
 Harmonics:
`:TRIG:HARM:SOUR EXT1`

Power Suite measurements (appear in many Modes):
 Channel Power:
`:TRIG:CHP:SOUR EXT1`

Occupied BW, Output Spectrum BW:
`:TRIG:OBW:SOUR EXT1`

Notes	<p>For some of the trigger parameters, the tie-in to the parameter is not obvious. These are:</p> <ul style="list-style-type: none">IMMediate, selects Free RunFRAMe, selects Periodic TriggerFMT, selects Frequency Mask TriggerAEXternal, selects Audio External trigger, using the TRIG IN connector on the M9260A Audio Analyzer module <p>For most measurements, the <measurement> keyword follows TRIGger. For Swept SA and RTSA Modes, do <i>not</i> use the <measurement> keyword. Using the wrong command form will result in an Undefined Header error</p> <p>Other trigger-related commands are found in the :INITiate and :ABORt SCPI command subsystems</p> <p>*OPC should be used after requesting data. This will hold off any subsequent changes to the selected trigger source, until after the sweep is completed and the data is returned</p> <p>Available ranges and presets can vary from mode to mode</p> <p>FMT (Pulse and RTSA apps):</p> <p>The amplitude resolution of the Frequency Mask is coupled to the Scale/Division. There are 256 vertical points therefore the amplitude resolution is computed using the algorithm: $(10 * \text{Scale/Div}) / \# \text{ Vertical Points}$</p>
Dependencies	<p>Not all trigger sources are available for each input. See the "RF Trigger Source (Remote Command Only)" on page 3265 and "I/Q Trigger Source (Remote Command Only)" on page 3267 commands for detailed information on which trigger sources are available for each input</p> <p>In some models, there is no second External input. In these models, the External 2 selection is not shown and the EXternal2 parameter will generate a "Hardware missing; Not available for this model number" message</p> <p>EXternal3 is available only when Option H1G is installed</p> <p>For the E7760 the only available selections are: EXternal1 IMMediate INTernal RFBurst VIDEo</p> <p>For UXM the only available selections are: EXternal1 IMMediate PRTChandet PRTFrame PRTEvent</p> <p>In the Pulse app, when Option B2X and H1G are installed and Digital IF BW is greater than 255.176 MHz, only three trigger sources, IMMediate, LEVel, and EXternal3 are available</p> <p>Level Trigger (Pulse and RTSA apps):</p> <p>Level trigger is allowed in average detector mode</p> <p>When Level Trigger is the selected Trigger Source in the Spectrum measurement, Spectrum minimum Acquisition Time is limited to the PVT minimum Acquisition Time. If the Spectrum Acquisition Time changed as a result of going into Level Trigger, a message is posted "Min Acq Time is 200 usec when Level Trigger is ON". When Level Trigger is no longer the selected Trigger Source, Spectrum minimum Acquisition Time is restored</p> <p>FMT (Pulse and RTSA apps):</p> <p>If you were not in Free Run when you entered the FMT Setup View, you can change Trigger Source to Free Run while in the editor. This will allow you to configure the mask with a continually updating trace. When exiting FMT Setup View, the Trigger Source will be changed back to FMT</p>

8 Trigger
8.1 Trigger

Couplings	<p>FMT (Pulse and RTSA apps):</p> <p>A remote user can enter or access FMT data via :TRIGger[:SEquence]:FMT[1] 2:DATA</p> <p>The upper and lower masks can have different freq/ampl pairs therefore subop code 1 is for the upper mask and subop code 2 is for the lower mask</p>
Preset	See "Trigger Source Presets" below
Status Bits/OPC dependencies	The Status Operation Register bit 5 "Waiting for Trigger" is set at the same time as the Sweeping or Measuring bit is set. It is cleared when the trigger actually occurs (that is, after the trigger event occurs and all the applicable trigger criteria have been met). A corresponding pop-up message ("Waiting for trigger") is generated if no trigger signal appears after approximately 2 sec. This message goes away when a trigger signal appears

Trigger Source Presets

The following Trigger Source presets are used for these measurements after a Mode Preset or Meas Preset:

Meas	Mode	Preset for RF	Preset for IQ
Swept SA	SA	IMM	IQ not supported
CHP	SA, WCDMA, MSR, SRCOMMS, 5G NR, WLAN	IMM	IQ not supported

RF Trigger Source (Remote Command Only)

Selects the trigger to be used for the specified measurement when RF is the selected input. The RF trigger source can be queried and changed even while another input is selected, but it is inactive until RF becomes the selected input.

Note the inclusion of the <measurement> parameter in the command below. Because each measurement remembers its own Trigger Source, the command must be qualified with the measurement name. Note that for the Swept SA measurement this is not the case; for backwards compatibility, no <measurement> parameter is used when setting the Trigger Source for the Swept SA measurement.

Remote Command	<pre>:TRIGger:<measurement>[:SEquence]:RF:SOURce EXTernal1 EXTernal2 IMMEDIATE LEVel FMT LINE FRAME RFBurst VIDeo IF TV PXI INTernal PRTChandet PRTFrame PRTEvent</pre> <pre>:TRIGger:<measurement>[:SEquence]:RF:SOURce?</pre> <p>Note that the available parameters are model number and hardware dependent</p>
----------------	---

Example	<p>Select the external 1 trigger input for the ACP measurement and the RF input:</p> <pre>:TRIG:ACP:RF:SOUR EXT1</pre> <p>Select video triggering for the SANalyzer measurement and the RF input. For SAN, do not use the <measurement> keyword:</p> <pre>:TRIG:RF:SOUR VID</pre>
---------	---

Notes	<p>Not all measurements have all the trigger sources available to them. Check the trigger source documentation for your specific measurement to see what sources are available</p> <p>Note that not all trigger sources are available for each input, and that the available parameters are model number and hardware dependent</p> <p>For the RF Trigger Source, the following trigger sources are available:</p>
-------	---

IMMediate	free run triggering
VIDeo	triggers on the video signal level
LEVel	triggers on the video signal level with time qualified triggering
FMT	triggers on the amplitude spectrum with frequency mask triggering
LINE	triggers on the power line signal
EXTernal1 or EXTernal	triggers on an externally connected trigger source marked “Trigger 1 In” on the rear panel of standalone instruments, “Trigger 3” on the front panel of EXM and VXT models SP900B/21A, and “Trigger 1” on the front panel of VXT models SP900B/11A
EXTernal2	triggers on an externally connected trigger source marked “Trigger 2 In” on the front panel of standalone instruments, and “Trigger 1” on the front panel of EXM and VXT models SP900B/21A ,and “Trigger 2” on the front panel of VXT models SP900B/11A. In some models, there is no second External input. In these models, the External 2 selection is not shown and the EXTernal2 parameter will generate a “Hardware missing; Not available for this model number” message
RFBurst	triggers on the bursted frame
FRAMe	triggers on the periodic timer
IF	same as video, for backwards compatibility only
Video	
PRTChandet	triggers on Base Station Emulation detecting a valid UL signal (PUSCH/PUCCH/PRACH/SRS)
PRTFrame	triggers on the Base Station Emulation periodic technology format radio frame with data frame aligned to the BSE timing
PRTEvent	triggers on the Base Station Emulation events
INTernal	triggers on the internal source trigger output, for models with an internal source such as VXT
PXI	only supported in PXI (modular) instruments
Trigger	<p>*OPC should be used after requesting data. This will hold off any subsequent changes to the selected trigger source, until after the sweep is completed and the data is returned</p> <p>Available ranges, and presets can vary from mode to mode</p>

Dependencies

The available choices for VXT are: Free Run, Video, Internal, External 1, External 2, RF Burst, Periodic and PXI

In VXT, Internal is only in VXT models SP900B/11A, not in models M9420/21A, and Internal and Periodic are not available in Spectrum Analyzer Mode

PXI is only found in VXT

The available choices for EXM are Free Run, Video, Internal, External 1, External 2, RF Burst, and Periodic

The available choices for UXM are Free Run, External 1, Prot Channel Detection, Prot Frame Aligned, and Prot Event

Prot Channel Detection, Prot Frame Aligned, and Prot Event are only available in UXM

The available choices for E7760 are Free Run, External 1, Internal, Video and RF Burst
In some models, there is no second External input. In these models, the External 2 selection is not shown and the **EXTernal12** parameter will generate a “Hardware missing; Not available for this model number” error

Status Bits/OPC dependencies The Status Operation Register bit 5 "Waiting for Trigger" is set at the same time as the Sweeping or Measuring bit is set. It is cleared when the trigger actually occurs (that is, after the trigger event occurs and all the applicable trigger criteria have been met). A corresponding pop-up message ("Waiting for trigger") is generated if no trigger signal appears after approximately 2 seconds. This message goes away when a trigger signal appears

I/Q Trigger Source (Remote Command Only)

Selects the trigger to be used for the specified measurement when I/Q (which requires option BBA) is the selected input. The I/Q trigger source can be queried and changed even while another input is selected, but it is inactive until I/Q becomes the selected input.

Remote Command `:TRIGger:<measurement>[:SEquence]:IQ:SOURce EXTernal1 | EXTernal2 | IMMEDIATE | IQMag | IDEMod | QDEMod | IINPut | QINPut | AIQMag`
`:TRIGger:<measurement>[:SEquence]:IQ:SOURce?`

Example `:TRIG:WAVEform:SOUR IQM`
Selects I/Q magnitude triggering for the IQ Waveform measurement and the I/Q input

Notes Not all measurements have all the trigger sources available to them. Check the trigger source documentation for your specific measurement to see what sources are available
Note that not all trigger sources are available for each input, and that the available parameters are model number and hardware dependent

For the **I/Q Trigger Source**, the following trigger sources are available:

IMMEDIATE	free run triggering
EXTernal1	triggers on an externally connected trigger source on the rear panel
or	
EXTernal	
EXTernal2	triggers on an externally connected trigger source on the front panel
IQMag	triggers on the magnitude of the I/Q signal
IDEMod	triggers on the I/Q signal's demodulated I voltage
QDEMod	triggers on the I/Q signal's demodulated Q voltage
IINPut	triggers on the I channel's ADC voltage
QINPut	triggers on the Q channel's ADC voltage
AIQMag	triggers on the magnitude of the auxiliary receiver channel I/Q signal

***OPC** should be used after requesting data. This will hold off any subsequent changes to the selected trigger source, until after the sweep is completed and the data is returned

	Available ranges, and from mode to mode presets can vary
Status Bits/OPC dependencies	The Status Operation Register bit 5 "Waiting for Trigger" is set at the same time as the Sweeping or Measuring bit is set. It is cleared when the trigger actually occurs (that is, after the trigger event occurs and all the applicable trigger criteria have been met). A corresponding pop-up message ("Waiting for trigger") is generated if no trigger signal appears after approximately 2 sec. This message goes away when a trigger signal appears

8.1.1.1 Free Run

Free Run triggering occurs immediately after the sweep/measurement is initiated.

Example	Swept SA measurement: :TRIG:SOUR IMM Measurements other than Swept SA: :TRIG:<meas>:SOUR IMM
Annunciation	Free Run (in the Meas Bar)

8.1.1.2 Video/ADC

The Video trigger condition is met when the video signal at the left edge of the graticule (the filtered and detected version of the input signal, including both RBW and VBW filtering) crosses the video trigger level with the chosen slope.

The Video trigger level is shown as a labeled line on the display. The line is displayed as long as Video is the selected trigger source. The Trigger Level line can be adjusted using the step keys, knob, or numeric keypad. It can also be dragged on the display with your finger or with a mouse.

When the detector selected for all active traces is the average detector, the video signal for triggering does not include any VBW filtering.

Log Plot and Spot Frequency measurements, in the Phase Noise Mode, do not support Video Trigger.

The **Trigger** tab contains the following Trigger Source dependent controls when Video Trigger is selected:

- "Prot Frame Aligned" on page 3280
- "Trigger Delay" on page 3283
- "Trigger Slope" on page 3287

Additional controls are also present, which are not dependent on the selected Trigger Source.

8 Trigger

8.1 Trigger

Note that Video Trigger is a software trigger of the acquired trace for some measurements and a hardware trigger of the IF envelope for others. Most measurements support one method or the other, although some (like ACP) don't support Video Trigger at all. For those measurements that support Video Trigger as a software trigger, the Trigger Level units will be dependent on the current Y Axis Unit for the measurement; for those that support Video Trigger as an IF Envelope trigger, the units are typically in dBm.

Example	<code>:TRIG:SOUR VID</code> Swept SA measurement <code>:TRIG:<meas>:SOUR VID</code> Measurements other than Swept SA
Annunciation	Video (in the Meas Bar)

8.1.1.3 ADC Trigger

Some IF Paths in certain models (like SP900S) in IQ Measurements have an ADC trigger. ADC is like the Video trigger, but with 2 limitations due to a lack of post-processing.

First, the trigger is not limited to the current measurement's setup IF BW. The trigger sees everything in the passband, so measurements like IQA Complex Spectrum can be triggered outside of the current Digital IF BW.

The final limitation is, due to lack of post-processing, the amplitude accuracy of the ADC trigger is less than the video trigger.

If ADC trigger is available for at least one IF Path on a model, then the ADC trigger will always be seen as a trigger option in IQ Measurements. However, it will only be available (not grayed out) to select when using IF Paths that support it.

If Video Trigger is selected and measurement setup (IF Path or IF BW) is changed to a path that only supports the ADC trigger instead, then ADC trigger will be selected and *vice versa*.

Example	Measurements other than Swept SA: <code>:TRIG:<meas>:SOUR ADC</code>
Annunciation	ADC (in the Meas Bar)

8.1.1.4 Line

When **Line** is selected, start of a new sweep/measurement will be synchronized with the next cycle of the line voltage.

Line trigger is not available when operating from a "dc power source", for example, when the instrument is powered from batteries.

Line trigger is not available when using modular instruments like the VXT.

The **Trigger** tab contains the following Trigger Source dependent controls when **Line** Trigger is selected:

- "Trigger Delay" on page 3283
- "Trigger Slope" on page 3287

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	<pre>:TRIG:SOUR LINE</pre> <p>Swept SA measurement</p> <pre>:TRIG:<meas>:SOUR LINE</pre> <p>Measurements other than Swept SA</p>
<hr/>	
Annunciation	LINE (in the Meas Bar)

8.1.1.5 External 1

When **External 1** is selected, a new sweep/measurement starts when the external trigger condition is met using the TRIGGER 1 IN input connector on the rear panel.

Grayed-out if Ext 1 is in use by Point Trigger in the Source Setup menu of Swept SA. Forced to "Select Trig Source" on page 3255 if already selected and Point Trigger is set to External 1.

The **Trigger** tab contains the following Trigger Source dependent controls when External 1 Trigger is selected:

- "Prot Frame Aligned" on page 3280
- "Trigger Delay" on page 3283
- "Trigger Slope" on page 3287

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	<pre>:TRIG:SOUR EXT1</pre> <p>Swept SA measurement</p> <pre>:TRIG:<meas>:SOUR EXT1</pre> <p>Measurements other than Swept SA</p>
<hr/>	
Annunciation	External 1 (in the Meas Bar)

8.1.1.6 External 2

When **External 2** is selected, a new sweep/measurement starts when the external trigger condition is met using the TRIGGER 2 IN input connector on the rear panel.

Grayed-out if Ext 2 is in use by Point Trigger in the Source Setup menu of Swept SA. Forced to "[Select Trig Source](#)" on page 3255 if already selected and Point Trigger is set to External 2.

The **Trigger** tab contains the following Trigger Source dependent controls when External 2 Trigger is selected:

- "[Prot Frame Aligned](#)" on page 3280
- "[Trigger Delay](#)" on page 3283
- "[Trigger Slope](#)" on page 3287

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	<code>:TRIG:SOUR EXT2</code> Swept SA measurement <code>:TRIG:<meas>:SOUR EXT2</code> Measurements other than Swept SA
Annunciation	External 2 (in the Meas Bar)

8.1.1.7 External 3

When **External 3** is selected, a new sweep/measurement starts when the external trigger condition is met using the TRIGGER 3 IN input connector on the rear panel.

This control only appears in certain instrument and option combinations, as follows.

- For SP900S, selects the Precision External Trigger, but available only when IF Path is 255 MHz or wider. The resolution will be within one sample count of the 4.8 GHz ADC sampling rate for 255 ~ 2 GHz IF Paths, and within one sample count of the 10.2 GHz sampling rate for the 4 GHz IF Path
- For all other instruments, available only if Option H1G is installed. It is only available when the 1 GHz path is chosen, either directly or indirectly; in all other paths it is visible but grayed-out. Direct and indirect selection of the 1 GHz path occurs as follows:
 - **Direct:** Measurements that directly support the 1 GHz path have a 1 GHz selection in the **IF Path** menu in **Meas Setup**

- **Indirect:** Certain measurements, such as Power Statistics CCDF (**PST**), always choose the widest available path, and so will choose the 1 GHz path if it is available, even if there is no **IF Path** menu for the measurement. **External 3** will be visible when this results in the 1 GHz path being selected, even if there is no control or readout indicating that the 1 GHz path has been selected

For a full list of Modes and measurements that support **External 3**, see "[External 3 Support](#)" on page 3258 in the section "[Select Trig Source](#)" on page 3255.

When **External 3** is set, and then becomes disabled because you switched away from the 1 GHz path, the Trigger Source selection reverts to the default ("[Select Trig Source](#)" on page 3255).

When **External 3** Trigger is selected, the **Trigger** tab displays the following Trigger Source dependent controls:

- "[Prot Frame Aligned](#)" on page 3280
- "[Trigger Delay](#)" on page 3283
- "[Trigger Slope](#)" on page 3287

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	<code>:TRIG:SPEC:SOUR EXT3</code> Sets External 3 as the trigger source for the Complex Spectrum measurement
Annunciation	External 3 (in the Meas Bar)

8.1.1.8 Audio External

When **Audio External** is selected, a new sweep/measurement starts when the external trigger condition is met using the TRIG IN input connector on the front panel of the M9260A Audio Analyzer module. This is a TTL level input (not analog) that supports both rising edge and falling edge triggers.

Only appears in modular instruments, and only when the M9260A Audio Analyzer module is installed, such as in M8920A.

The **Trigger** tab contains the following Trigger Source dependent controls when Audio External Trigger is selected:

- "[Trigger Delay](#)" on page 3283
- "[Trigger Slope](#)" on page 3287

Additional controls are also present that are not dependent on the selected Trigger Source.

8 Trigger

8.1 Trigger

Example	<code>:TRIG:RTES:SOUR AEXT</code> Sets Audio External as the trigger source for the Radio Test measurement
Annunciation	Audio Ext (in the Meas Bar)

8.1.1.9 RF Burst

When **RF Burst** is selected, a new sweep/measurement starts when an RF burst envelope signal is identified from the signal at the RF Input connector.

In some models, a variety of burst trigger circuitry is available, resulting in various available burst trigger bandwidths. The instrument automatically chooses the appropriate trigger path based on the hardware configuration and other settings of the instrument.

The **Trigger** tab contains the following Trigger Source dependent controls when RF Burst is selected:

- "Trigger Level Absolute/Relative" on page 3288
- "Absolute Trigger Level" on page 3288
- "Relative Trigger Level" on page 3289
- "Trigger Delay" on page 3283
- "Trigger Slope" on page 3287

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	<code>:TRIG:SOUR RFB</code> Swept SA measurement <code>:TRIG:<meas>:SOUR RFB</code> Measurements other than Swept SA
Annunciation	RF Burst (in the Meas Bar)

8.1.1.10 Periodic

When **Periodic** is selected, the instrument uses a built-in periodic timer signal as the trigger. Trigger occurrences are set by the **Periodic Timer** parameter, which is modified by the **Offset** and Periodic Sync Src.

Use this trigger when there is a periodic signal but no reliable signal on which to trigger. You can synchronize the periodic signal with outside events (using the

Periodic Sync Src) to get closer to a reliable trigger signal (see ["More Information" on page 3274](#) below).

If you do not have a sync source selected (**OFF**), then the internal timer will not be synchronized with any external timing events.

The **Trigger** tab contains the following Trigger Source dependent controls when Periodic Trigger is selected:

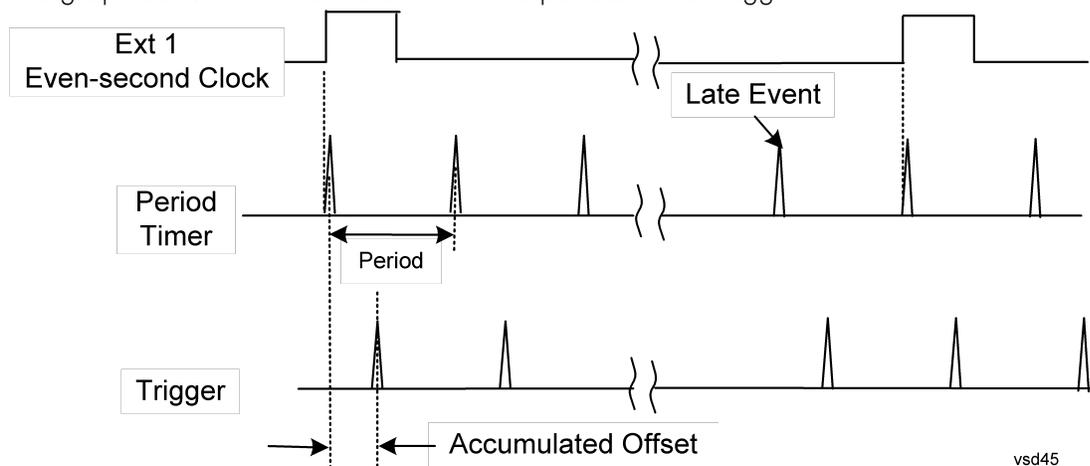

- ["Period" on page 3291](#)
- ["Offset" on page 3291](#)
- ["Reset Offset Display" on page 3292](#)
- ["Sync Source" on page 3293](#)
- ["Trigger Delay" on page 3283](#)

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	<code>:TRIG:SOUR FRAM</code> Swept SA measurement <code>:TRIG:<meas>:SOUR FRAM</code> Measurements other than Swept SA
Annunciation	Periodic (in the Meas Bar)

More Information

The graphic below shows the action of the periodic timer trigger.

8 Trigger

8.1 Trigger

A common application is measuring periodic burst RF signals for which a trigger signal is not easily available. For example, we might be measuring a TDMA radio that bursts every 20 ms. Let's assume that the 20 ms period is very consistent. Let's also assume that we do not have an external trigger source available that is synchronized with the period, and that the signal-to-noise ratio of the signal is not high enough to provide a clean RF burst trigger at all of the analysis frequencies. For example, we might want to measure spurious transmissions at an offset from the carrier that is larger than the bandwidth of the RF burst trigger. In this application, we can set the Periodic Timer to a 20.00 ms period and adjust the offset from that timer to position our trigger just where we want it. If we find that the 20.00 ms is not exactly right, we can adjust the period slightly to minimize the drift between the period timer and the signal to be measured.

A second way to use this feature would be to use **Sync Source** temporarily, instead of **Offset**. In this case, we might tune to the signal in a narrow span and use the RF Burst trigger to synchronize the periodic timer. Then we would turn the sync source off so that it would not miss-trigger. Miss-triggering can occur when we are tuned so far away from the RF burst trigger that it is no longer reliable.

A third example would be to synchronize to a signal that has a reference time element of much longer period than the period of interest. In some CDMA applications, it is useful to look at signals with a short periodicity, by synchronizing that periodicity to the "even-second clock" edge that happens every two seconds. Thus, we could connect the even-second clock trigger to Ext1 and use then Ext1 as the sync source for the periodic timer.

The figure below illustrates this third example. The top trace represents the even-second clock. It causes the periodic timer to synchronize with the leading edge shown. The instrument trigger occurs at a time delayed by the accumulated offset from the period trigger event. The periodic timer continues to run, and triggers continue to occur, with a periodicity determined by the instrument time base. The timer output (labeled "late event") will drift away from its ideal time due to imperfect matching between the time base of the signal being measured and the time base of the instrument, and also because of imperfect setting of the period parameter. But the synchronization is restored on the next even-second clock event. ("Accumulated offset" is described in the in the **Offset** function section.)

8.1.1.11 I/Q Mag

When **I/Q Mag** is selected, the trigger condition is met when the I/Q magnitude crosses the I/Q magnitude trigger level. The magnitude is measured at the output of the main I/Q digital receiver.

This trigger type is only valid for measurements that support the I/Q inputs.

The **Trigger** tab contains the following Trigger Source dependent controls when I/Q Mag Trigger is selected:

- ["Prot Frame Aligned" on page 3280](#)
- ["Trigger Delay" on page 3283](#)
- ["Trigger Slope" on page 3287](#)

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	<code>:TRIG:<meas>:SOUR IQM</code>
---------	--

Annunciation	I/Q Mag (in the Meas Bar)
--------------	---------------------------

8.1.1.12 Input I

When **Input I** is selected, the condition is met when the voltage at the I Input crosses the trigger level.

This trigger type is only valid for measurements that support the I/Q inputs.

The **Trigger** tab contains the following Trigger Source dependent controls when Input I Trigger is selected:

- ["Prot Frame Aligned" on page 3280](#)
- ["Trigger Delay" on page 3283](#)
- ["Trigger Slope" on page 3287](#)

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	<code>:TRIG:<meas>:SOUR IINP</code>
---------	---

Annunciation	Input I (in the Meas Bar)
--------------	---------------------------

8.1.1.13 Input Q

When **Input Q** is selected, the condition is met when the voltage at the I Input crosses the trigger level.

This trigger type is only valid for measurements that support the I/Q inputs.

The **Trigger** tab contains the following Trigger Source dependent controls when Input Q Trigger is selected:

- ["Prot Frame Aligned" on page 3280](#)
- ["Trigger Delay" on page 3283](#)

8 Trigger
8.1 Trigger

- ["Trigger Slope" on page 3287](#)

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	<code>:TRIG:<meas>:SOUR QINP</code>
---------	---

Annunciation	Input Q (in the Meas Bar)
--------------	---------------------------

8.1.1.14 I (Demodulated)

When **I (Demodulated)** is selected, the trigger condition is met when the I voltage crosses the I voltage trigger level.

This trigger type is only valid for measurements that support the I/Q inputs.

The **Trigger** tab contains the following Trigger Source dependent controls when I (Demodulated) Trigger is selected:

- ["Prot Frame Aligned" on page 3280](#)
- ["Trigger Delay" on page 3283](#)
- ["Trigger Slope" on page 3287](#)

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	<code>:TRIG:<meas>:SOUR IDEM</code>
---------	---

Annunciation	I (Demod) (in the Meas Bar)
--------------	-----------------------------

8.1.1.15 Q (Demodulated)

When **Q (Demodulated)** is selected, the trigger condition is met when the Q voltage crosses the Q voltage trigger level.

This trigger type is only valid for measurements that support the I/Q inputs.

The **Trigger** tab contains the following Trigger Source dependent controls when Q (Demodulated) Trigger is selected:

- ["Prot Frame Aligned" on page 3280](#)
- ["Trigger Delay" on page 3283](#)
- ["Trigger Slope" on page 3287](#)

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	:TRIG:<meas>:SOUR QDEM
Annunciation	Q (Demod) (in the Meas Bar)

8.1.1.16 Aux I/Q Mag

When **Aux I/Q Mag** is selected, the trigger condition is met when the auxiliary receiver's I/Q magnitude output crosses the Auxiliary I/Q magnitude trigger level.

This trigger type is only valid for measurements that support the I/Q inputs.

The **Trigger** tab contains the following Trigger Source dependent controls when Aux I/Q Mag Trigger is selected:

- "Prot Frame Aligned" on page 3280
- "Trigger Delay" on page 3283
- "Trigger Slope" on page 3287
- "Trigger Center Frequency" on page 3296
- "Trigger BW" on page 3296

Additional controls are also present that are not dependent on the selected Trigger Source.

Example	:TRIG:<meas>:SOUR AIQM
Annunciation	Aux I/Q Mag (in the Meas Bar)

8.1.1.17 PXI

When **PXI** is selected, a new sweep/measurement will start when detecting the signal from the PXI backplane trigger line.

This trigger type is only found in the modular instrument products.

The **Trigger** tab contains the following Trigger Source dependent controls when PXI Trigger is selected:

- "Select PXI Line" on page 3298
- "Trigger Delay" on page 3283
- "Trigger Slope" on page 3287

Additional controls are also present that are not dependent on the selected Trigger Source.

8 Trigger

8.1 Trigger

Example	Swept SA measurement: <code>:TRIG:SOUR PXI</code> Measurements other than Swept SA: <code>:TRIG:<meas>:SOUR PXI</code>
Annunciation	PXI (in the Meas Bar)

8.1.1.18 Internal

When **Internal** is selected, the trigger condition is met when detecting the signal from the internal RF Source module.

This trigger type is only found in the modular instrument products.

The **Trigger** tab contains the following Trigger Source dependent controls when Aux I/Q Mag Trigger is selected:

- ["Prot Frame Aligned" on page 3280](#)
- ["Trigger Delay" on page 3283](#)
- ["Trigger Slope" on page 3287](#)

Additional controls are also present that are not dependent on the selected Trigger Source.

For an Internal trigger to occur, there must be a trigger output from the internal RF source. This means that you must configure the Source Trigger Output before selecting Internal as the Trigger Source. To enable the Source Trigger Output, output trigger should not be off if internal source works as list sequence mode and Trig 2 Out should not be off if internal source works as MXG mode. Otherwise, no trigger occurs and measurement does not start.

Example	Swept SA measurement: <code>:TRIG:SOUR INTernal</code> Measurements other than Swept SA: <code>:TRIG:<meas>:SOUR INTernal</code>
Annunciation	Internal (in the Meas Bar)

8.1.1.19 Prot Channel Detection

Selects a protocol channel detection Base Station Emulation as the trigger. When Prot Channel Detection is selected, a new sweep/measurement will start when the protocol channel detection trigger condition is met.

Protocol Channel Detection Trigger is defined as the Base Station Emulation protocol channel detection event of PUSCH, PUCCH, PRACH or SRS. With this trigger, the IQ data, and therefore the measurement, is aligned at the beginning of the LTE sub-frame where the particular event was detected. Channel transmission is aligned to the sub-frame boundary; therefore, the measurement is aligned with its transmission with the exception of SRS, which might not start at the beginning of the sub-frame containing the SRS as it might have an offset from the start of the sub-frame base on the SRS configuration, In this case, the trigger and measurement are aligned to the beginning of the sub-frame containing SRS as defined by this trigger type (which is not the beginning of the SRS itself due to the offset).

This trigger type is only available in UXM.

Example	<code>:TRIG:<meas>:SOUR PRTC</code>
Annunciation	Prot Chan Det (in the Meas Bar)

8.1.1.20 Prot Frame Aligned

Selects a protocol frame aligned Base Station Emulation as the trigger. When Prot Frame Aligned is selected, a new sweep/measurement will start when the protocol frame aligned data trigger condition is met.

Prot Frame Aligned Trigger is aligned with the Base Station Emulation Protocol uplink frame timing boundary. It depends on the technology format of the base station call processing.

This trigger type is only available in UXM.

Example	<code>:TRIG:<meas>:SOUR PRTF</code>
Annunciation	Prot Frame (in the Meas Bar)

8.1.1.21 Prot Event

Selects a protocol frame aligned Base Station Emulation as the trigger. When Prot Frame Aligned is selected, a new sweep/measurement will start when the protocol frame aligned data trigger condition is met.

Prot Event Trigger is defined as the Base Station Emulation protocol internal event such as the starting of a predefined uplink pattern for a relative power control ramp. With this trigger, the IQ data, and therefore the measurement, is aligned with the start of the desired uplink pattern.

This trigger type is only available in UXM.

Example	<code>:TRIG:<meas>:SOUR PRTF</code>
Annunciation	Prot Frame (in the Meas Bar)

8.1.2 Trigger Level

Sets the amplitude level for Trigger and Gate sources that use level triggering. When the video signal crosses this level, with the chosen slope, the trigger occurs.

For any given Trigger, Gate, or Periodic Sync Src, the same Trigger Level is used for the Trigger source in the Trigger menu, for the Gate source in the Gate Source menu, and for the Periodic Sync source in the Periodic Sync Src menu.

If **Video** is the selected trigger source, the trigger level displays as a green horizontal line with the label TRIG LVL just above it on the right:

If the value of trigger level is off screen low this line displays along the bottom of the graticule. If the value of trigger level is off screen high this line displays above the graticule but no farther above than 1.5 % of the graticule height (the same as the trace itself). Note that the TRIG LVL label cannot display above the graticule so the label itself stops at the top of the graticule.

For the I/Q Triggers, the I/Q reference impedance is used for converting between power and voltage.

Trigger Level Parameters

Source	Example	Min	Max	Preset	Resolution	Step Key Incr.	Knob Incr.
Video	TRIG:VID:LEV -40 dBm	-170 dBm	+30 dBm	-25 dBm	.01 dB	Scale/Div (Log), 1 dB (Lin)	Step/10, but never < 0.1 dB
Level	TRIG:LEV:LEV -40 dBm	-170 dBm	+30 dBm	-25 dBm	.01 dB	Scale/Div (Log), 1 dB (Lin)	Step/10, but never < 0.1 dB

More Information

For Video Trigger Level, when sweep type = FFT, the video trigger uses the amplitude envelope in a bandwidth wider than the FFT width as a trigger source. This can be useful, but does not have the same relationship between the displayed trace and the trigger level as in swept triggering.

For Video Trigger Level the settable resolution of the function is 0.01 dB, even when the Y Axis Unit is linear. In Linear Y Axis Unit (for example, Volts) this requires 4 significant digits to display on the control.

For the Level trigger source, used in RTSA and other measurements, External Gain and Ref Level Offset modify the actual trace data as it is taken and are taken into account by Trig Level.

Remote Command	<pre>:TRIGger[:SEquence]:<trig_source>:LEVel <ampl> :TRIGger[:SEquence]:<trig_source>:LEVel?</pre> <p>where <trig_source> is one of: EXTernal1 EXTernal2 VIDEo ADC LEVel IQMag IDEMod QDEMod IINPut QINPut AIQMag INTernal</p>
Example	:TRIG:VID:LEV -40 dBm
Dependencies	Only appears when Video, External 1 2, or an I/Q trigger is selected as the Trigger Source

8.1.3 Trigger Delay

Controls a time delay that the instrument will wait to begin a sweep after meeting the trigger criteria, for Trigger and Gate sources that support Trigger Delay.

For any given Trigger, Gate, or Periodic Sync source, the same Trigger Delay is used for the Trigger source in the Trigger menu, for the Gate source in the Gate Source menu, and for the Periodic Sync source in the Periodic Sync Src menu.

Negative trigger delays can be used. Negative trigger delay makes intuitive sense in time domain and works well in FFT mode where the bandwidth of the filter before the video trigger is about 1.25 span. You can use negative delay to pre-trigger the instrument in the time domain or FFT, but not in swept spans. Video trigger delay may be set to negative values, in time domain, FFT and even swept, but in swept spans, negative settings of Trig Delay are treated as a zero setting within the internal hardware and the advisory message "Neg. Trig Delay unavailable in Swept Mode, zero delay used." is generated when such a delay is set.

Remote Command	<pre>:TRIGger[:SEQuence]:<trig_source>:DELay <time></pre> <pre>:TRIGger[:SEQuence]:<trig_source>:DELay?</pre> <p>where <trig_source> is one of:</p> <pre>LINE EXTernal1 EXTernal2 AEXTernal VIDEo ADC RFBurst </pre> <pre>FRAMe LEVel FMT IQMag IDEMod QDEMod IINPut QINPut </pre> <pre>AIQMag PXI INTernal</pre> <pre>:TRIGger[:SEQuence]:<trig_source>:DELay:STATe OFF ON 0 1</pre> <pre>:TRIGger[:SEQuence]:<trig_source>:DELay:STATe?</pre> <p>where <trig_source> is one of:</p> <pre>LINE EXTernal1 EXTernal2 VIDEo LEVel FMT RFBurst FRAMe </pre> <pre>IQMag IDEMod QDEMod IINPut QINPut AIQMag</pre>
Example	<pre>:TRIG:VID:DEL:STAT ON</pre> <pre>:TRIG:VID:DEL 100 ms</pre>
Dependencies	Only appears when Video, Line, External 1 2, RF Burst, Periodic Timer or an I/Q trigger is selected as the Trigger Source

Couplings	When FMT Trigger Criteria is INSIDE or OUTSIDE , FMT Trigger Delay State is forced to OFF FMT Trigger Delay MaxValue is dependent on the current AcquisitionTime. The equation is: MaxValue = 2 ¹⁶ x AcqTime, but never to exceed 70 sec. Ex: In PVT View with a min PVT Acq Time of 200 us, this Trigger Delay MaxValue is 13.26 sec. In RT Spectrum and Spectrogram with a min Acq Time of 100 us, this Trigger Delay MaxValue is 6.55 sec. When the Acq Time is increased, this MaxValue also increases
Preset	OFF
State Saved	Saved in instrument state
Annotation	Trig Delay (in the Measurement Bar)
Backwards Compatibility Notes	For backward compatibility with VSA/PSA comms apps :TRIGger[:SEquence]:IF:DElay :TRIGger[:SEquence]:DElay The legacy :TRIGger[:SEquence]:DElay command affects the delay for the VID , LINE , EXT1 , EXT2 , and RFB triggers
Example	:TRIG:DEL 1 ms
Preset	1 us
State Saved	Saved in instrument state
Backwards Compatibility SCPI	:TRIGger[:SEquence]:DElay <time> :TRIGger[:SEquence]:DElay? :TRIGger[:SEquence]:DElay:STATE OFF ON 0 1 :TRIGger[:SEquence]:DElay:STATE?
Remote Command	:TRIGger[:SEquence]:OFFSet:STATE OFF ON 0 1 :TRIGger[:SEquence]:OFFSet:STATE?
Example	:TRIG:OFFS ON :TRIG:OFFS -100 ms
Notes	These are ESA commands for trigger offset that allowed you to use a positive or negative delay when in zero span and in a Res BW >= 1 kHz. For ESA compatibility, X-series instruments keep track of this offset and adds it to the Trigger Delay for VIDEO, LINE, EXTERNAL1 or EXTERNAL2 whenever the value is sent to the hardware, if in Zero Span and RBW >= 1 kHz
Preset	Off, 0 s OFF
State Saved	Saved in instrument state
Min	-11 s
Max	+11 s
Backwards Compatibility SCPI	:TRIGger[:SEquence]:OFFSet <time> :TRIGger[:SEquence]:OFFSet?

8 Trigger
8.1 Trigger

Trigger Delay Parameters

Note: in Swept SA, when transitioning from Zero Span to Swept spans, the trigger delay is clipped to -150 ms if it had been longer in Zero Span.

Source	Example	Preset	Min	Max	Resolution
Video	TRIG:VID:DEL:STAT ON TRIG:VID:DEL 100 ms	Off, 1 us	-150 ms (-10s in Swept SA Zero Span)	+500 ms	100 ns
Level	TRIG:LEV:DEL:STAT ON TRIG:LEV:DEL 100 ms	Off, 30 ms	0 ms	70 sec (but dependent on Acq Time like FMT)	Multiple of Acq Time (as is FMT)
FMT	TRIG:FMT:DEL:STAT ON TRIG:FMT:DEL 100 ms	Off, 30 ms	0 ms	70 sec (but dependent on Acq Time like FMT)	Multiple of Acq Time (as is FMT)
External 1 2	TRIG:EXT1:DEL:STAT ON TRIG:EXT2:DEL 100 ms	Off, 1 us	-150 ms (-10s in Swept SA Zero Span)	+500 ms	100 ns
Line	TRIG:LINE:DEL:STAT ON TRIG:LINE:DEL 100 ms	Off, 1 us	-150 ms (-10s in Swept SA Zero Span)	+500 ms	100 ns
RF Burst	TRIG:RFB:DEL:STAT ON TRIG:RFB:DEL 100 ms	Off, 1 us	-150 ms (-10s in Swept SA Zero Span)	+500 ms	100 ns
Periodic Timer	TRIG:FRAM:DEL:STAT ON TRIG:FRAM:DEL 100 ms	Off, 1 us	-150 ms (-10s in Swept SA Zero Span)	+500 ms	100 ns
I/Q Mag	TRIG:IQM:DEL:STAT ON TRIG:IQM:DEL 10 ms	Off, 1 us	-2.5 s	+10 s	10 ns
I (Demod)	TRIG>IDEM:DEL:STAT ON TRIG>IDEM:DEL 10	Off, 1 us	-2.5 s	+10 s	10 ns

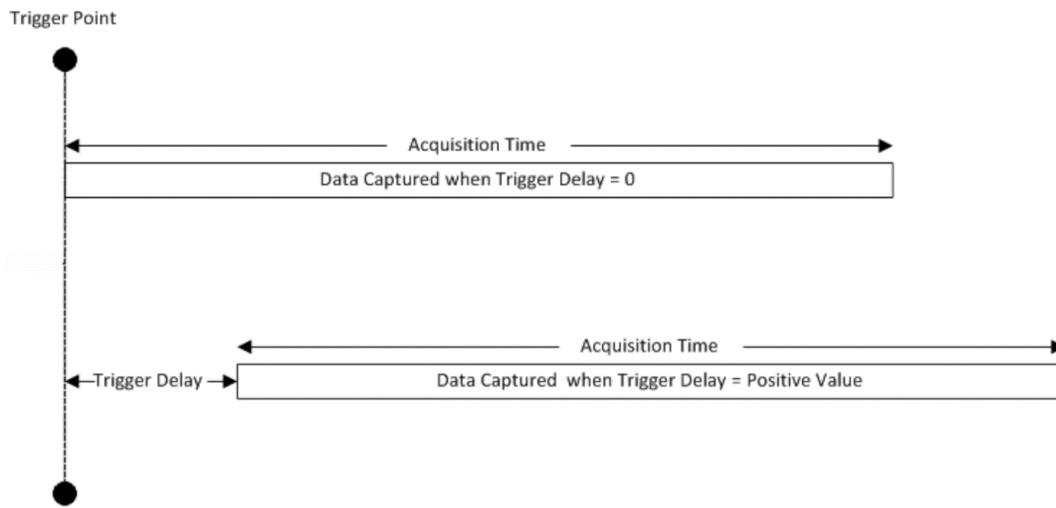

Source	Example	Preset	Min	Max	Resolution
Q (Demod)	ms TRIG:QDEM:DEL:STAT ON	Off, 1 us	-2.5 s	+10 s	10 ns
	TRIG:QDEM:DEL 10 ms				
Input I	TRIG:IINP:DEL:STAT ON	Off, 1 us	-2.5 s	+10 s	10 ns
	TRIG:IINP:DEL 10 ms				
Input Q	TRIG:QINP:DEL:STAT ON	Off, 1 us	-2.5 s	+10 s	10 ns
	TRIG:QINP:DEL 10 ms				
Aux Chan I/Q Mag	TRIG:AIQM:DEL:STAT ON	Off, 1 us	-2.5 s	+10 s	10 ns
	TRIG:AIQM:DEL 10 ms				
PXI	TRIG:PXI:DEL:STAT ON	Off, 1 us	-150 ms	+500 ms	100 ns
	TRIG:PXI:DEL 10 ms				
Internal	TRIG:INT:DEL:STAT ON	Off, 1 us	-150 ms	+500 ms	100 ns
	TRIG:INT:DEL 10 ms				
Prot Channel Detection	TRIG:PRTC:DEL:STAT ON	Off, 1 ms	-10 ms	+10 ms	100 ns
	TRIG:PRTC:DEL 1 ms				
Prot Frame Aligned	TRIG:PRTF:DEL:STAT ON	Off, 1 ms	-10 ms	+10 ms	100 ns
	TRIG:PRTF:DEL 1 ms				
Prot Event	TRIG:PRTE:DEL:STAT ON	Off, 1 ms	-10 ms	+10 ms	100 ns
	TRIG:PRTE:DEL 1 ms				

Note: in Bluetooth Mode, the preset value of Trigger Delay is always (On, -20us).

More Information

Here is the diagram for Frequency Mask Trigger (FMT) Trigger Delay:

8 Trigger
8.1 Trigger

8.1.4 Trigger Slope

Sets the trigger polarity for Trigger and Gate sources that support Trigger Slope. It is set positive to trigger on a rising edge and negative to trigger on a falling edge.

For any given Trigger, Gate, or Periodic Sync source, the same Trigger Slope is used for the Trigger source in the Trigger menu, for the Gate source in the Gate Source menu, and for the Periodic Sync source in the Periodic Sync Src menu.

Remote Command `:TRIGger[:SEquence]:<trig_source>:SLOPe POSitive | NEGative`
 `:TRIGger[:SEquence]:<trig_source>:SLOPe?`

where <trig_source> is one of:
 LINE | EXTERNAL1 | EXTERNAL2 | AEXTERNAL | VIDEO | ADC | RFBURST |
 IQMAG | IDEMOD | QDEMOD | IINPUT | QINPUT | AIQMAG | PXI | INTERNAL

Example `:TRIG:VID:SLOP NEG`
 `:TRIG:VID:SLOP?`
 `:TRIG:EXT1: SLOP NEG`

Dependencies Only appears when Video, Line, External 1|2, RF Burst or an I/Q trigger is selected as the Trigger Source

Preset `POSitive`

State Saved Saved in instrument state

Backwards `:TRIGger[:SEquence]:IF:SLOPe NEGative | POSitive`

Compatibility SCPI `:TRIGger[:SEquence]:IF:SLOPe?`

For backward compatibility with VSA/PSA comms apps

`:TRIGger[:SEquence]:EXTernal:SLOPe`

For backward compatibility, the parameter `EXTernal1` is mapped to `EXTernal1`
`:TRIGger[:SEquence]:FRAMe:EXTernal1:SLOPe`
`:TRIGger[:SEquence]:FRAMe:EXTernal2:SLOPe`

Example	<code>:TRIG:SLOP NEG</code>
Preset	<code>POSitive</code>
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:TRIGger[:SEquence]:SLOPe POSitive NEGative</code> <code>:TRIGger[:SEquence]:SLOPe?</code>

Note: when transitioning from Zero Span to Swept spans, the trigger delay is clipped to -150 ms if it had been longer in Zero Span.

8.1.5 Trigger Level Absolute/Relative

Selects either Absolute or Relative Burst Triggering.

Remote Command	<code>:TRIGger[:SEquence]:RFBurst:LEVel:TYPE ABSolute RELative</code> <code>:TRIGger[:SEquence]:RFBurst:LEVel:TYPE?</code>
Example	<code>:TRIG:RFB:LEV:TYPE REL</code> sets the trigger level type of the RF burst trigger to Relative
Dependencies	Only appears when RF Burst is selected as the Trigger Source
Preset	<code>ABSolute</code>
State Saved	Saved in instrument state

8.1.6 Absolute Trigger Level

Sets the absolute trigger level for the RF burst envelope.

NOTE

When using the External Mixing path, the Absolute Trigger Level is uncalibrated because the factory default was set to accommodate the expected IF levels for the RF path.

Remote Command	<code>:TRIGger[:SEquence]:RFBurst:LEVel:ABSolute <ampl></code> <code>:TRIGger[:SEquence]:RFBurst:LEVel:ABSolute?</code>
Example	<code>:TRIG:RFB:LEV:ABS 10 dBm</code> sets the trigger level of the RF burst envelope signal to the absolute level of 10 dBm
Notes	Sending this command does not switch the setting from relative to absolute; to switch it you need to send <code>:TRIGger[:SEquence]:RFBurst:LEVel:TYPE</code>

8 Trigger

8.1 Trigger

	For Bluetooth Mode, the default value is -50 dBm
Dependencies	Only appears when RF Burst is selected as the Trigger, Gate or Periodic Sync Source
Couplings	This same level is used for the RF Burst trigger source in the Trigger menu, for the RF Burst selection in the Gate Source menu, and also for the RF Burst selection in the Periodic Sync Src menu
Preset	LTEA FDD/TDD modes: -40 dBm or -50 dBm depending on the hardware 5G NR mode: -40 dBm All other modes: -20 dBm
State Saved	Saved in instrument state
Min	-200 dBm
Max	100 dBm
Backwards Compatibility SCPI	<code>:TRIGger[:SEquence]:FRAME:RFBurst:LEVel:ABSolute</code>

8.1.7 Relative Trigger Level

Sets the relative trigger level for the RF burst envelope.

In some models, the relative burst trigger function is implemented in hardware. In other models, without the advanced triggering hardware required, the relative burst trigger function is implemented in software in some measurements, and is unavailable in other measurements.

When implemented in software, the relative RF Burst trigger function is implemented as follows:

1. The measurement starts with the absolute RF Burst trigger setting. If it cannot get a trigger with that level, auto trigger fires and the acquisition starts anyway. After the acquisition, the measurement searches for the peak in the acquired waveform and saves it
2. In the next cycle of the measurement, the measurement determines a new absolute RF Burst level based on the peak value from the first measurement and the Relative RF Burst Trigger Level (always 0 or negative dB) set by the user. The following formula is used: absolute RF Burst level = peak level of the previous acquisition + relative RF Burst level
3. If the new absolute RF Burst level differs from the previous by more than 0.5 dB, the new level is sent to the hardware; otherwise it is not updated (to avoid slowing down the acquisition)

Steps 2 and 3 repeat for subsequent measurements.

Remote Command	<code>:TRIGger[:SEquence]:RFBurst:LEVel:RELative <rel_amp></code> <code>:TRIGger[:SEquence]:RFBurst:LEVel:RELative?</code>
----------------	---

Example	<code>:TRIG:RFB:LEV:REL -10 dB</code> sets the trigger level of the RF burst envelope signal to the relative level of -10 dB
Notes	Sending this command does not switch the setting from absolute to relative; to switch it you need to send <code>:TRIGger[:SEquence]:RFBurst:LEVel:TYPE</code> The relative trigger level is not available in some measurements. In those measurements the RELative parameter, and <code>:TRIGger[:SEquence]:RFBurst:LEVel:TYPE</code> generates an error if sent
Dependencies	This control is grayed-out and Absolute Trigger Level selected if the required hardware is not present in your instrument and the current measurement does not support Relative triggering Only appears when RF Burst is selected as the Trigger Source
Preset	-6 dB GSM: -25 dB
State Saved	Saved in instrument state
Min	-45 dB
Max	0 dB
Backwards Compatibility SCPI	<code>:TRIGger[:SEquence]:RFBurst:LEVel</code> This legacy command is aliased to <code>:TRIGger[:SEquence]:RFBurst:LEVel:RELative</code> because the PSA had <i>only</i> relative burst triggering

In some models, a variety of burst trigger circuitry is available, resulting in various available burst trigger bandwidths. The instrument automatically chooses the appropriate trigger path based on the hardware configuration and other settings of the instrument. Here is the RF Burst Trigger Bandwidth table for Swept SA Measurement in SA mode:

Model	Option	Span	Swp Type	FFT Width	Trigger BW, -10 dB	Notes
EXA	any	All	all	all	16 MHz	
MXA	w/o B25	All	all	all	16 MHz	
MXA	B25	Zero	N/A	N/A	16 MHz	
MXA	B25	All	Swept	N/A	16 MHz	
MXA	B25	<8 MHz	FFT	all	16 MHz	
MXA	B25	≥8 MHz	FFT	25 MHz	30 MHz	
PXA	any	all	all	all	>80 MHz	Exceptions(*)

(*) Exceptions: When the RF Burst Trigger Level Type is Absolute, the start frequency is below 300 MHz, and the sweep type is either Swept or FFT with an FFT width of less than 25 MHz, then the RF Burst Trigger Bandwidth is not >80 MHz. It would be 16 MHz except in the subcase of Sweep Type = FFT and FFT Width between 8 and 25 MHz inclusive, where it would be 30 MHz.

8.1.8 Period

Sets the period of the internal periodic timer clock. For digital communications signals, this is usually set to the frame period of your current input signal. In the case that sync source is not set to OFF, and the external sync source rate is changed for some reason, the periodic timer is synchronized at the every external synchronization pulse by resetting the internal state of the timer circuit.

Remote Command	<code>:TRIGger[:SEQuence]:FRAMe:PERiod <time></code> <code>:TRIGger[:SEQuence]:FRAMe:PERiod?</code>
Example	<code>:TRIG:FRAM:PER 100 ms</code>
Dependencies	The invalid data indicator turns on when the period is changed, until the next sweep/measurement completes Only appears when Periodic Timer is selected as the Trigger or Gate Source
Couplings	The same period is used in the Gate Source selection of the period timer
Preset	20 ms unless noted below: GSM: 4.615383 ms 5G NR: 10 ms
State Saved	Saved in instrument state
Min	100.000 ns
Max	559.0000 ms

8.1.9 Offset

Adjusts the accumulated offset between the periodic timer events and the trigger event. Adjusting the accumulated offset is different than setting an offset, and requires explanation.

The periodic timer is usually not synchronized with any external events, so the timing of its output events has no absolute meaning. Since the timing relative to external events (RF signals) is important, you need to be able to adjust (offset) it. However, you have no direct way to see when the periodic timer events occur. All that you can see is the trigger timing. When you want to adjust the trigger timing, you will be changing the internal offset between the periodic timer events and the trigger event. Because the absolute value of that internal offset is unknown, we will just call that the accumulated offset. Whenever the Offset parameter is changed, you are changing that accumulated offset. You can reset the displayed offset using Reset Offset Display. Changing the display does not change the value of the accumulated offset, and you can still make additional changes to accumulated offset.

To avoid ambiguity, we define that an increase in the "offset" parameter, either from the knob or the SCPI adjust command, serves to delay the timing of the trigger event.

Remote Command	<code>:TRIGger[:SEQuence]:FRAMe:OFFSet <time></code> <code>:TRIGger[:SEQuence]:FRAMe:OFFSet?</code>
Example	<code>:TRIG:FRAM:OFFS 1.2 ms</code>
Notes	<p>The front panel interface (for example, the knob), and this command, adjust the accumulated offset, which is shown on the control</p> <p>However, the actual amount sent to the hardware each time the offset is updated is the delta value, that is, the current accumulated offset value minus the previous accumulated offset value. Note that the accumulated offset value is essentially arbitrary; it represents the accumulated offset from the last time the offset was zeroed (with the Reset Offset Display key)</p> <p>Note that this command does not change the period of the trigger waveform. Note also that Offset is used only when the sync source is set to OFF, otherwise delay is used, see "Trigger Delay" on page 3283</p> <p>An increase in the "offset" parameter, either from the knob or the SCPI adjust command, serves to delay the timing of the trigger event</p> <p>When the SCPI command is sent the value shown on the control is updated with the new value. However, the actual amount sent to the hardware is the delta value, that is, the current accumulated offset value minus the previous accumulated offset value</p> <p>The SCPI query simply returns the value currently showing on the key</p>
Dependencies	<p>The invalid data indicator turns on when the offset is changed, until the next sweep/measurement completes</p> <p>Only appears when Periodic Timer is selected as the Trigger or Gate Source</p>
Couplings	The same offset is used in the Gate Source selection of the period timer
Preset	0 s
State Saved	Saved in instrument state
Min	-10.000 s
Max	10.000 s

8.1.10 Reset Offset Display

Resets the value of the periodic trigger offset display setting to 0.0 seconds. The current displayed trigger location may include an offset value defined with the **Offset** key. Pressing this control redefines the currently displayed trigger location as the new trigger point that is 0.0 s offset. The **Offset** control can then be used to add offset relative to this new timing.

Remote Command	<code>:TRIGger[:SEQuence]:FRAMe:OFFSet:DISPlay:RESet</code>
Example	<code>:TRIG:FRAM:OFFS:DISP:RES</code>
Dependencies	Only appears when Periodic Timer is selected as the Trigger or Gate Source

8.1.11 Offset Adjust (Remote Command Only)

Lets you advance the phase of the frame trigger by the amount you specify. It does *not* work in the same way as the related front panel keys.

The command does not change the period of the trigger waveform. If the command is sent multiple times, it advances the phase of the frame trigger an additional amount each time it is sent. Negative numbers are permitted.

Remote Command	<code>:TRIGger[:SEquence]:FRAMe:ADJust <time></code>
Example	<code>:TRIG:FRAM:ADJ 1.2 ms</code>
Notes	<p>Note also that Offset is used only when the sync source is set to OFF, otherwise delay is used, see section "Trigger Delay" on page 3283</p> <p>An increase in the "offset" parameter, either from the knob or the SCPI adjust command, serves to delay the timing of the trigger event</p> <p>The front panel interface (for example, the knob) and the <code>:TRIG:FRAM:OFFS</code> command adjust the accumulated offset, which is shown on the active function display. However, the actual amount sent to the hardware is the delta value, that is, the current offset value minus the previous offset value</p> <p>When the SCPI command is sent the value shown on the control (and the Active Function, if this happens to be the active function) is updated by increasing it (or decreasing it if the value sent is negative) by the amount specified in the SCPI command</p> <p>This is no query for this command</p>
Dependencies	The invalid data indicator turns on when the offset is changed, until the next sweep/measurement completes
Couplings	The same offset is used in the Gate Source selection of the period timer
Preset	0 s
State Saved	Saved in instrument state
Min	-10.000 s
Max	10.000 s

8.1.12 Sync Source

For convenience, you can select the Periodic Timer Sync Source using this dropdown. You can also select it from the Periodic Sync Src tab, which also contains controls that let you configure the Sync Source.

Selects a signal source for you to synchronize your periodic timer trigger to, otherwise you might be triggering at some arbitrary location in the frame. Synchronization reduces the precision requirements on the setting of the period.

Example	<code>:TRIG:FRAM:SYNC EXT1</code> <code>:TRIG:FRAM:SYNC EXT2</code>
---------	--

	<code>:TRIG:FRAM:SYNC RFB</code>
	<code>:TRIG:FRAM:SYNC OFF</code>
Dependencies	Only appears when Periodic Timer is selected as the Trigger or Gate Source
Preset	<code>OFF</code>
State Saved	Saved in instrument state

8.1.13 TV Line

Selects the **TV Line** number on which to trigger. Line number range is dependent on the settings of the **"Standard"** on page 3295 and **"Field"** on page 3295 menus within the TV trigger setup functions. When the line number is incremented beyond the upper limit, the value will change to the lower limit and continue incrementing from there. When the line number is decremented below the lower limit, the value will change to the upper limit and continue decrementing from there.

Remote Command	<code>:TRIGger[:SEquence]:TV:LINE <integer></code> <code>:TRIGger[:SEquence]:TV:LINE?</code>
Example	<code>:TRIG:TV:LINE 20</code> <code>:TRIG:TV:LINE?</code>
Dependencies	Only available in the Swept SA measurement Only appears when TV is selected as the Trigger Source
Preset	17
State Saved	Saved in instrument state
Min	1 The minimum value is the minimum line, and rolls over to the maximum value. The minimum line number depends on which Field and standard are selected
Max	The maximum value is the maximum line, and rolls over to the minimum value. The maximum line number depends on which Field and standard are selected Field 1 (ODD): <ul style="list-style-type: none"> - Maximum line is 263 for formats NTSC-M, NTSC-Japan, NTSC-4.43, PAL-M and PAL-60 - Maximum line is 313 for formats PAL-B, D, G, H, I, PAL-N, PAL-N Combin, and SECAM-L Field 2 (EVEN): <ul style="list-style-type: none"> - The maximum line 262 for formats NTSC-M, NTSC-Japan, NTSC-4.43, PAL-M and PAL-60 - The maximum line is 312 for formats PAL-B, D, G, H, I, PAL-N, PAL-N Combin, and SECAM-L Field = Entire Frame: <ul style="list-style-type: none"> - 525, for formats NTSC-M, NTSC-Japan, NTSC-4.43, PAL-M and PAL-60 625, for formats PAL-B, D, G, H, I, PAL-N, PAL-N Combin, and SECAM-L

8.1.14 Field

Selects the **Field** on which to trigger:

Entire Frame	ENTire	Causes the selected line number to be viewed as an offset into the entire frame starting with line 1, the first line in Field One
Field One	ODD	Causes the selected line number to be viewed as an offset into the first field starting with Line 1, the first line in Field One
Field Two	EVEN	Causes the selected line number to be viewed as an offset into the second field. If Line 1 is selected, it is the 264th line of the frame (NTSC-M, NTSC-Japan, NTSC-4.43, PAL-M, PAL-60) or the 314th line of the frame (PAL-B,D,G,H,I, PAL-N, PAL-N-Combin, SECAM-L)

Remote Command	:TRIGger[:SEquence]:TV:FMODe ENTire ODD EVEN :TRIGger[:SEquence]:TV:FMODe?
Example	:TRIG:TV:FMOD ENT :TRIG:TV:FMOD EVEN :TRIG:TV:FMOD ODD
Dependencies	Only available in the Swept SA measurement Only appears when TV is selected as the Trigger Source This command is available only when Option B7B (TV trigger) is installed
Preset	ENTire
Range	ENTire ODD EVEN

8.1.15 Standard

Accesses the **Standard** menu keys, which select from the following TV standards:

NTSC-M	MNTSc
NTSC-Japan	JNTSc
NTSC-4.43	NTSC443
PAL-M	MPAL
PAL-B,D,G,H,I	BPAL
PAL-N	NPAL
PAL-N-Combin	CPAL
PAL-60	PAL60
SECAM-L	LSEC

As the TV standard is changed, the current line value is clipped as necessary to keep it valid for the chosen standard and field mode. For example, line 600 is

selected in Entire Frame mode in PAL-N; if NTSC-M is selected, the line number is clipped to 525. Or, if line 313 is selected in Field 1 mode in PAL-N and NTSC-M is selected, the line number is clipped to 263. Changing back to the PAL-N standard will leave the line number at 263.

Remote Command	<code>:TRIGger[:SEquence]:TV:STANdard MNTSc JNTSc NTSC443 MPAL BPAL NPAL CPAL PAL60 LSEC</code> <code>:TRIGger[:SEquence]:TV:STANdard?</code>
Example	Sets NTSC-M <code>:TRIG:TV:STAN MNTS</code> Queries Standard <code>:TRIG:TV:STAN?</code>
Dependencies	Only available in the Swept SA measurement Only appears when TV is selected as the Trigger Source
Preset	<code>MNTS</code>
State Saved	Saved in instrument state
Range	<code>MNTSc JNTSc NTSC443 MPAL BPAL NPAL CPAL PAL60 LSEC</code>

8.1.16 Trigger Center Frequency

Sets the center frequency to be used by the auxiliary receiver for the Auxiliary Channel I/Q Magnitude trigger.

Remote Command	<code>:TRIGger[:SEquence]:AIQMag:CENTer <freq></code> <code>:TRIGger[:SEquence]:AIQMag:CENTer?</code>
Example	<code>:TRIG:AIQM:CENT 10 MHz</code>
Notes	Trigger CF + 1/2 Trigger BW < Max Trigger CF - 1/2 Trigger BW > Min
Dependencies	Only appears when Aux Channel I/Q Mag is selected as the Trigger Source
Preset	0 Hz
State Saved	Saved in instrument state
Range	-40 MHz to 40 MHz
Min	-40 MHz
Max	40 MHz

8.1.17 Trigger BW

Sets the information bandwidth used by the auxiliary receiver for the Auxiliary Channel I/Q Magnitude trigger.

8 Trigger

8.1 Trigger

Remote Command	<code>:TRIGger[:SEquence]:AIQMag:BANDwidth <freq></code> <code>:TRIGger[:SEquence]:AIQMag:BANDwidth?</code>
Example	<code>:TRIG:AIQM:BAND 8 MHz</code>
Notes	The combined sample rate for the main and auxiliary receivers cannot exceed 100 MSa/sec. The bandwidth available to the Trigger BW is limited to what is available after the main receiver's bandwidth (Info BW, sometimes pre-FFT BW) is set. Because of this limitation, the Max is not always achievable The combination of Trigger Center Freq and Trigger BW is also limited: <ul style="list-style-type: none"> - Trigger CF + 1/2 Trigger BW < Max - Trigger CF - 1/2 Trigger BW > Min
Dependencies	Only appears when Aux Channel I/Q Mag is selected as the Trigger Source
Preset	Bandwidth option dependent: <ul style="list-style-type: none"> - No Opt: 10 MHz - Opt B25: 25 MHz - Opt S40: 40 MHz
State Saved	Saved in instrument state
Range	10 Hz to Maximum
Min	10 Hz
Max	Bandwidth option & I/Q input path dependent: <ul style="list-style-type: none"> - No Opt, I or Q Only: 10 MHz, I+jQ: 20 MHz - Opt B25, I or Q Only: 25 MHz, I+jQ: 50 MHz - Opt S40, I or Q Only: 40 MHz, I+jQ: 80 MHz

8.1.18 Zero Span Delay Compensation On/Off

In zero span, there is a natural delay in the signal path, which comes from the RBW filter. This is usually desirable, as it allows you to trigger on events and also see those events, because the signal is delayed from the trigger event. However, in some cases it is desirable to eliminate this delay, so that trigger events line up exactly with the zero time point in zero span. You can use the **Zero Span Delay Comp On/Off** feature to enable or disable zero span delay compensation.

Remote Command	<code>:TRIGger[:SEquence]:EXTernal1 EXTernal2 RFBurst:DElay:COMPensation OFF</code> <code> ON 0 1</code> <code>:TRIGger[:SEquence]:EXTernal1 EXTernal2 RFBurst:DElay:COMPensation?</code>
Example	<code>:TRIG:EXT1:DEL:COMP ON</code> <code>:TRIG:EXT1:DEL:COMP?</code>

	<code>:TRIG:EXT2:DEL:COMP ON</code>
	<code>:TRIG:RFB:DEL:COMP ON</code>
Dependencies	<p>No effect except in zero-span, but not locked out in nonzero spans</p> <p>Zero Span Delay Compensation only appears in the Swept SA and List Power Step measurements. Only External and RF Burst triggers support it</p> <p>This control does not appear in VXT</p> <p>If the SCPI command is sent when the control is not shown, an error is returned: -221, "Settings conflict; Feature not supported for this measurement"</p> <p>Only appears when External 1 2 or RF Burst is selected as the Trigger, Gate or Periodic Sync Source</p>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

8.1.19 Select PXI Line

Controls which PXI_TRIG[0..7] backplane line is used for the trigger source.

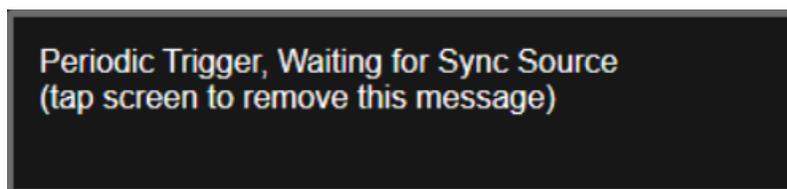

This control is only found in modular analyzer products.

Remote Command	<code>:TRIGger[:SEquence]:PXI:LINE <line></code> <code>:TRIGger[:SEquence]:PXI:LINE?</code>
Example	<code>:TRIG:PXI:LIN 2</code>
Preset	0
State Saved	Saved in instrument state
Range	[0,7]

8.1.20 Reset Sync Monitor

Allows you to reset the status of Synchronization for Periodic trigger This control works together with bit 6 "Waiting for Periodic Sync Source" in STATus:OPERation:CONDition status register.

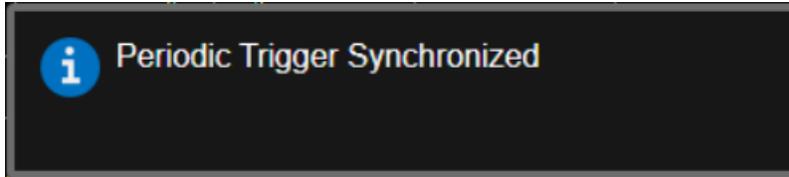

When you first switch to periodic trigger, RF Burst is the default Sync Source. The register will be set immediately. A "Periodic Trigger, Waiting for Sync Source" message will be generated after 2 seconds (if the instrument is not synchronized). The system is waiting for a RF Burst signal. You can tap the screen to remove the message.

8 Trigger

8.1 Trigger

Once RF burst signal is provided and the hardware synchronized, the register will be cleared and a “Periodic Trigger Synchronized” message will be generated.

When change to a new Sync Source other than Off, take External1 as an example. You'll get the condition register set to 1 and a pop-up message again. There are the possible following conditions:

- External1 is provided: the register is cleared, message is updated.
- External1 is not provided, you set the Sync Source to Off: the register is cleared, message is cleared.
- External1 is not provided, you set the Sync Source to External2: the register and message keep the same.
- External1 is not provided, you set the Sync Source back to RF Burst: the register is cleared, message is also cleared. That's because the instrument is synchronized to RF Burst already. If you want to make a new synchronization, you have to press “Reset Sync Monitor” you send SCPI command “:TRIG:FRAM:SMON:RES”.

Remote Command	<code>:TRIGger[:SEquence]:FRAMe:SMONitor:RESet</code>
Example	<code>:TRIG:FRAM:SMON:RES</code>
Notes	<p>This control works together with bit 1 “Waiting for Periodic Sync Source” in STATus:OPERation:INSTRument:CONDition status register.</p> <p>A “Periodic Trigger, Waiting for Sync Source” message will be generated after pressing this control, and the status bit will be set.</p> <p>A “Periodic Trigger Synchronized” message will be generated after successfully synchronizing to Sync Source, and the status bit will be cleared.</p>
Dependencies	<p>Only functional when Periodic Trigger is selected as the Trigger or Gate Source, and Sync Source is not Off.</p> <p>Only available in VXT models SP900B/11A/15A</p>
Status Bits/OPC dependencies	Bit 6 of :STATus:OPERation:CONDition will be set after pressing this control

8.1.21 Trigger Optimization

Sets the trigger behavior for various desired operation conditions.

Remote Command	<code>:TRIGger[:SEquence]:OPTimize:MODE NORMal MJITter</code>
----------------	---

	For option details, see More Information <code>:TRIGger[:SEquence]:OPTimize:MODE?</code>
Example	<code>:TRIG:OPT:MOD MJIT</code> selects trigger optimization for minimum jitter <code>:TRIG:OPT:MOD?</code>
Dependencies	Only appears in VXT models SP900B/11A/15A Minimum jitter is functional only when digital IF BW is lower than 300 MHz. When Trigger Optimization is set to Minimum jitter and it's not in effect, the following warning message appears in the status bar: Settings Alert;Minimum Jitter is not available
Preset	<code>NORMal</code>
State Saved	Yes
Range	<code>NORMal MJITter</code>

More Information

Here is information about the various Trigger optimization type:

Trigger Optimization	Example	Notes
Normal	<code>:TRIG:OPT:MOD NORM</code>	No optimization
Minimum Jitter	<code>:TRIG:OPT:MOD MJIT</code>	Optimizes trigger for minimum jitter. A software resample method is provided to reduce jitter, at the expense of some measurement speed The acquisition jitter depends on the digital IF BW, the jitter will be smaller when digital IF BW gets larger. For example, when the digital IF BW is 98.3 MHz in 5GNR, the jitter varies under 15ns. When set MJITter as trigger optimization type, the jitter will be reduced to 1ns This setting applies to all the Trigger Sources

8.1.22 Trigger Settings Diagram

Lets you configure the Trigger system using a visual utility.

First, select what you want to configure (the Trigger, Gate or Periodic Sync Source) by tapping the box for **Trigger**, **Gate** or **Periodic Sync Source**.

Next, tap any box in the gray row to choose a Trigger Source to connect to. For **Periodic Sync Source**, you can also tap **Off**.

8 Trigger

8.1 Trigger

The **Trigger Settings Diagram** changes depending on context. The Trigger Sources that are available change depending on which input you have selected.

8.2 Gate Source

Contains controls that let you select and configure Gate control signals.

This tab appears in the **Trigger** menu panel for measurements that support gating. In measurements that do not support gating, this tab does not appear.

The menus under the **Gate Source** tab are the same as those under the **Trigger** tab, with these exceptions:

A smaller set of sources is available for gating.

The Free Run and Video selections are not provided for Gate

- The Trig Delay controls are not present
- Relative RF Burst Triggering is not available, just Absolute
- There is an additional control, Sync Holdoff, under Gate Source

Any changes to the settings in the setup menus under each Gate Source selection (for example: Trigger Level, Trigger Delay, etc.) also affect the corresponding settings under the Trigger menu keys. The gate system uses the Trigger SCPI commands for the setup functions, since each setting affects both Gate and Trigger.

Example: to set the Trigger Level for External 1 Trigger you use the command `:TRIG:EXT1:LEV`; to set the Trigger Level for External 1 Gate you use the same command, `:TRIG:EXT1:LEV`. By the same token, once you set the External 1 Trigger Level to 1v, it is 1v whether External 1 is being used as a Gate Source or a Trigger Source.

If a command is sent to the **TRIG** node to set the functions that are omitted from the **Gate Source** menus (Auto Trig, Holdoff, Trig Delay), it is accepted and the values stored, but the values are not visible from the **Gate Source** menus.

8.2.1 Select Gate Source

Selects the source of the Gate signal for doing Gated Trigger measurements.

This version of the **Select Gate Source** function is used in all measurements except the Pulse measurement application.

Selecting a Gate Source is similar to selecting a Trigger Source; you select from the same sources as for Trigger Source, but the choices are limited to:

8 Trigger

8.2 Gate Source

- Line
- External 1|2
- Internal
- RF Burst
- Periodic

For the selection of the gate source the SCPI node, `:TRIGger[:SEquence]` is replaced by `[:SENSe]:SWEep:EGATe` as shown in the remote command below. Because you can independently set the Gate Source and the Trigger Source, there is a separate SCPI command for the Gate Source.

Remote Command	<code>[:SENSe]:SWEep:EGATe:SOURce EXTernal1 EXTernal2 LINE FRAME RFBurst TV VIDeo PXI INTernal</code> <code>[:SENSe]:SWEep:EGATe:SOURce?</code>
Example	<code>:SWE:EGAT:SOUR EXT1</code> <code>:SWE:EGAT:SOUR?</code>
Dependencies	<p>The available choices for VXT are: Video, Internal, External 1, External 2, RF Burst, Periodic and PXI Internal and Periodic are not available in Spectrum Analyzer Mode In VXT, Internal is only in VXT models SP900B/11A, not in models M9420/21A PXI is only found in VXT</p> <p>The available choices for EXM are Video, Internal, External 1, External 2, RF Burst, and Periodic This control is not available in E7760</p> <p>In some models, there is no second External input. In these models, the External 2 selection is not shown and the EXTernal2 parameter will generate a "Hardware missing; Not available for this model number" error</p>
Preset	<p>GSM/EDGE: FRAM</p> <p>MSR: EXT1</p> <p>LTEATDD, 5G NR:</p> <ul style="list-style-type: none">- Direction is Downlink: EXT1- Direction is Uplink: FRAM <p>All Others: EXT1</p>

8.2.2 Sync Holdoff

Sync Holdoff, which only applies to the Periodic Timer, specifies the duration that the sync source signal for the Periodic Timer must be kept false before the transition to true to be recognized as the sync timing. The periodic timer phase is aligned when the sync source signal becomes true, after the Holdoff time is satisfied.

A holdoff of 2 ms will work with most WiMAX signals, but there may be cases where the burst off duration is less than 1 ms and this value will need to be changed.

Remote Command	<pre> :TRIGger[:SEquence]:FRAMe:SYNC:HOLDoff <time> :TRIGger[:SEquence]:FRAMe:SYNC:HOLDoff? :TRIGger[:SEquence]:FRAMe:SYNC:HOLDoff:STATe OFF ON 0 1 :TRIGger[:SEquence]:FRAMe:SYNC:HOLDoff:STATe? </pre>
Example	<pre> :TRIG:FRAM:SYNC:HOLD 5 :TRIG:FRAM:SYNC:HOLD? </pre>
Dependencies	<p>Only appears if Periodic is the selected Gate Source</p> <p>Does not appear in all Measurements. For example, does not appear in Swept SA</p>
Preset	<p>On, 1.000 ms</p> <p>5G NR: On, 250.0 us</p> <p>Channel Quality: Off, 4 msec</p> <p>ON</p>
State Saved	Saved in instrument state
Min	0 ms
Max	+500 ms

8.3 Gate Settings

Contains controls that let you control the gating function. The Gate functionality is used to view signals best viewed by qualifying them with other events.

This tab appears in the **Trigger** menu panel for measurements that support gating. In measurements that do not support gating, this tab does not appear.

In the Swept SA measurement, the Gate controls, and all SCPI under the `[:SENSe] :SWEep:EGATe` SCPI node are unavailable when Source Mode is set to Tracking. This is because the Gate circuitry is used to sync the external source. If the Tracking Source is turned on, the Gate is turned off.

Gate setup parameters are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

Note that Sweep Time auto coupling rules and annotation are changed when Gate is on.

8.3.1 Gate On/Off

Turns the gate function on and off.

When the Gate Function is **ON**, the selected Gate Method is used along with the gate settings and the signal at the gate source to control the sweep and video system with the gate signal. Not all measurements allow every type of Gate Methods.

If the Gate were to be turned **ON** without a gate signal present, Marker Count operation would be unreliable, so it is locked out whenever Gate is on for measurements that support Marker Count.

Remote Command	<code>[:SENSe] :SWEep:EGATe [:STATe] OFF ON 0 1</code> <code>[:SENSe] :SWEep:EGATe [:STATe] ?</code>
Example	<code>:SWE:EGAT ON</code> <code>:SWE:EGAT?</code>
Dependencies	The function is unavailable (grayed-out) and OFF when: <ul style="list-style-type: none"> – Gate Method is LO or Video and FFT Sweep Type is manually selected – Gate Method is FFT, and Swept Sweep Type is manually selected – Marker Count is ON <p>The following are unavailable whenever Gate is on:</p>

- FFT under **Sweep Type** when Method=LO or Video or **Swept** under **Sweep Type** when Method=FFT
- **Marker Count**

While Gate is on, the Auto Rules for Sweep Type are modified so that the choice agrees with the Gate Method: i.e., FFT for Method = FFT and Swept for Method = LO or Video

When in the ACP measurement:

- When Meas Method is RBW or FAST, this function is unavailable and the control is grayed-out
- Whenever Gate is on, Meas Method, RBW, or FAST is unavailable and keys for those are grayed-out
- When Gate is on, Offset Res BW and Offset Video BW are ignored (if you set these values) and the measurement works as if all Offset Res BW and all Offset Video BW are coupled with the Res BW and the Video BW under the BW menu. When Gate is on, the Offset BW control in the Offset/Limit menu is grayed-out

Preset	LTEATDD Mode: ON Other modes: OFF
State Saved	Saved in instrument state
Range	OFF ON
Annunciation	Annunciated in the Meas Bar ; if Gate is on, the word "Gate:" followed by the gate type appears, where <ul style="list-style-type: none"> - LO = Gated LO - Vid = Gated Video - FFT = Gated FFT
Backwards Compatibility SCPI	[:SENSe] :SWEep :TIME :GATE [:STATe] ESA compatibility
Backwards Compatibility Notes	In ESA, Trig Delay (On) and Gate (On) could not be active at the same time. This dependency does not exist in PSA or in the X-Series

8.3.2 Gate View On/Off

Turning on Gate View puts the instrument into Gate View. When in Gate View, the regular view of the current measurement traces and results are reduced vertically to about 70% of the regular height. The Zero Span window, showing the positions of the Gate, is shown between the Measurement Bar and the reduced measurement window. By reducing the height of the measurement window, some of the annotation on the Data Display may not fit and is not shown.

Remote Command	[:SENSe] :SWEep :EGATe :VIEW ON OFF 1 0 [:SENSe] :SWEep :EGATe :VIEW?
----------------	--

8 Trigger

8.3 Gate Settings

Example	:SWE:EGAT:VIEW ON turns on the gate view
Dependencies	In the Swept SA measurement: In Gate View, the regular Sweep Time (or Acquisition Time) control is grayed out, to avoid confusing the user who wants to set Gate View Sweep Time. When pressed, the grayed out control puts up the informational message "Use Gate View Sweep Time in the Gate menu" In the other measurements: When you turn Gate View on, the lower window takes on the current state of the instrument. Upon leaving Gate View, the instrument takes on the state of the lower window When you turn Gate View on, the upper window Sweep Time (or Acquisition Time) is set to Gate View Sweep Time (or Gate View Acquisition Time)
Couplings	These couplings apply to the Swept SA measurement: <ul style="list-style-type: none"> - When Gate View is turned on, the instrument is set to Zero Span - Gate View automatically turns off whenever a Span other than Zero is selected - Gate View automatically turns off if you press the Swept Span toggle under Freq while in Gate View, and the instrument returns to the Span it was in before entering Gate View (even if that is Zero Span) - When Gate View is turned on, the sweep time used is the Gate View Sweep Time. This is set according to the rules in section "Gate View Sweep Time" on page 3313 - When Gate View is turned off, Sweep Time is set to the normal Swept SA measurement sweep time - If Gate View is on and Gate is off, then turning on Gate turns off Gate View
Preset	OFF
State Saved	Saved in instrument state
Range	ON OFF

Annunciation For Gate View to work properly, a gate signal must be present at the selected Gate Source. Therefore, in Gate View, any time more than 2 seconds passes with no gate signal, a pop-up message "Waiting for gate input" appears. This message goes away when a gate signal appears

Turning Gate View off returns the instrument to the Normal measurement view.

In Swept SA, the normal measurement view is the single-window Swept SA view. When returning to this view, the Swept SA measurement returns to the Span it was in before entering **Gate View** (even if that is Zero Span).

The **Gate View** window is triggered from the Gate Source, with zero trigger delay. Also, when updating the **Gate View** window, the Gate itself must not operate. So it is internally shut off while the gate view window is being updated. For the Swept SA measurement, this means that the Gate is internally shut off whenever the gate view window is displayed. The measurement bar and controls continue to show the

Trigger source for the main sweep window and give no indication that the Gate is shut off or that the Gate View window is triggered from the Gate Source.

When in **Gate View**, vertical lines are displayed in the Gate View window as follows:

Green lines labeled GATE START and GATE STOP are displayed at the gate edges as follows: in Edge Gate, a line is shown for Delay and one for the end of the Gate period, defined by Length. In Level Gate a line is shown only for Delay. You can adjust the position of the green lines by adjusting the gate length and the gate delay or by dragging them with your finger or the mouse.. These lines update in the Gate View window as the active function changes, even if the window is not being updated. In Gated LO and Gated Video, these lines are positioned relative to the delay reference line (not relative to 0 time). In Gated FFT, their location is relative to the left edge of the screen.

A blue line is displayed showing the delay reference, that is, the reference point for the Gate Delay within the Zero Span window. The blue line represents where (in time) the effective location of the gate start would be if the gate were programmed to zero delay.

- A second blue line is displayed at the location that represents the boundary between "compensated IF" and "compensated LO" operating modes. The second blue line is labeled "MIN FAST" because it represents the minimum Gate Delay for fast Gated LO operation. This line is only displayed in Gated LO. You cannot scroll (knob) or decrement (down key) the Gate Delay to less than that represented by the position of this line, it can only be set below this position manually, although once there it can be moved freely with the knob while below the line.

A yellow line in the Gated Video case only, is displayed at B_{length} , where B_{length} is the display point (bucket) length for the swept trace, which is given by the Sweep Time (or Acquisition Time) for that trace divided by number of Points - 1. So it is referenced to 0 time, not to the delay reference. This line is labeled NEXT PT (it is not shown in the figure above because the figure above is for Gated LO). The yellow line represents the edge of a display point (bucket). Normally in Gated Video, the bucket length must be selected so that it exceeds the off time of the burst. There is another way to use the instrument in Gated Video measurements, and that is to set the bucket width much shorter than the off time of the burst. Then use the Max Hold trace function to fill in "missing" buckets more slowly. This allows you to see some of the patterns of the Gated Video results earlier, though seeing a completely filled-in spectrum later.

8.3.3 Gate Delay

Controls the length of time from the time the gate condition goes True until the gate is turned on.

Remote `[:SENSE] :SWEep:EGATe:DELAy <time>`

8 Trigger
8.3 Gate Settings

Command	<code>[:SENSe] :SWEEp :EGATe :DELay ?</code>
Example	<code>:SWE :EGAT :DELay 500ms</code> <code>:SWE :EGAT :DELay ?</code>
Notes	Units of time are required, or no units; otherwise an invalid suffix error message is generated
Preset	WiMAX OFDMA: 71 us GSM/EDGE: 600 us WLAN: 500 us 5G NR: 5 ms Others: 57.7 us
State Saved	Saved in instrument state
Min	0.0 us
Max	100 s
Backwards Compatibility SCPI	<code>[:SENSe] :SWEEp :TIME :GATE :DELay</code> ESA compatibility

8.3.4 Gate Length

Controls the length of time that the gate is on after it opens.

Remote Command	<code>[:SENSe] :SWEEp :EGATe :LENGth <time></code> <code>[:SENSe] :SWEEp :EGATe :LENGth ?</code>
Example	<code>:SWE :EGAT :LENG 1</code> <code>:SWE :EGAT :LENG ?</code>
Notes	Units of time are required, or no units; otherwise an invalid suffix error message is generated
Dependencies	Grayed-out when Gate Method is set to FFT , in which case the label changes to that shown below 
	The control is also grayed-out if Gate Control = LEVe1
Preset	WiMAX OFDMA: 50 us GSM/EDGE: 200 us WLAN: 1.54 ms Others: 461.6 us
State Saved	Saved in instrument state
Min	100 ns
Max	5 s

Backwards	<code>[:SENSe] :SWEep :TIME :GATE :LENGth</code>
Compatibility SCPI	ESA compatibility

8.3.5 Gate Method

Lets you choose one of the three different types of gating. Not all types of gating are available for all measurements.

Remote Command	<code>[:SENSe] :SWEep :EGATE :METHod LO VIDEo FFT</code> For option details, see " LO " on page 3310, " Video " on page 3311 or " FFT " on page 3311 <code>[:SENSe] :SWEep :EGATE :METHod?</code>
Example	<code>:SWE :EGAT :METH FFT</code>
Dependencies	This function is only available in the Swept SA measurement in Spectrum Analyzer Mode This control is unavailable when Gate is On and FFT Sweep Type manually selected When selected, Sweep Type is forced to Swept, and the FFT selection in Sweep Type is grayed-out Only the FFT method is supported in non-SA products Only the FFT method is supported by VXT models SP900B/11A
Preset	LO
State Saved	Saved in instrument state
Range	Video LO FFT
Annunciation	In Meas Bar

LO

In [LO](#) gating, when Gate is [ON](#), the LO sweeps whenever the gate conditions as specified in the Gate menu are satisfied by the signal at the Gate Source.

This form of gating is more sophisticated, and results in faster measurements. With Gated LO, the instrument only sweeps while the gate conditions are satisfied. This means that a sweep could take place over several gate events. It would start when the gate signal goes true and stop when it goes false, and then continue when it goes true again. But since the LO is sweeping as long as the gate conditions are satisfied, the sweep typically finishes much more quickly than with Gated Video.

When in zero span, there is no actual sweep performed. But data is only taken while the gate conditions are satisfied. So even though there is no sweep, the gate settings will impact when data is acquired.

Video

In **Video** gating, when Gate is **ON**, the video signal is allowed to pass through whenever the gate conditions as specified in the Gate menu are satisfied by the signal at the Gate Source.

This form of gating may be thought of as a simple switch, which connects the signal to the input of the spectrum analyzer. When the gate conditions are satisfied, the switch is closed, and when the gate conditions are not satisfied, the switch is open. So we only look at the signal while the gate conditions are satisfied.

With this type of gating, you usually set the instrument to sweep very slowly. In fact, a general rule is to sweep slowly enough that the gate is guaranteed to be closed at least once per data measurement interval (bucket). Then if the peak detector is used, each bucket will represent the peak signal as it looks with the gate closed.

FFT

In **FFT** gating, when Gate is **ON**, an FFT is performed whenever the gate conditions as specified in the Gate menu are satisfied by the signal at the Gate Source. This is an FFT measurement that begins when the gate conditions are satisfied. Since the time period of an FFT is approximately $1.83/\text{RBW}$, you get a measurement that starts under predefined conditions and takes place over a predefined period. So, in essence, this is a gated measurement. You have limited control over the gate length but it works in FFT sweeps, which the other two methods do not.

Gated FFT is not possible in zero span since the instrument is not sweeping, so in zero span the Gated LO method is used. Data is still only taken while the gate conditions are satisfied, so the gate settings do impact when data is acquired.

The Gate Length will be $1.83/\text{RBW}$.

This is a convenient way to make a triggered FFT measurement under control of an external gating signal.

8.3.6 Control Edge/Level

Sets the method of controlling the gating function from the gating signal.

EDGE	The gate opens (after the Delay) on the selected edge (for example, positive) of the gate signal and closes on the alternate edge (for example, negative)
LEVe1	The gate opens (after the Delay) when the gate signal has achieved a certain level and stays open as long as that level is maintained

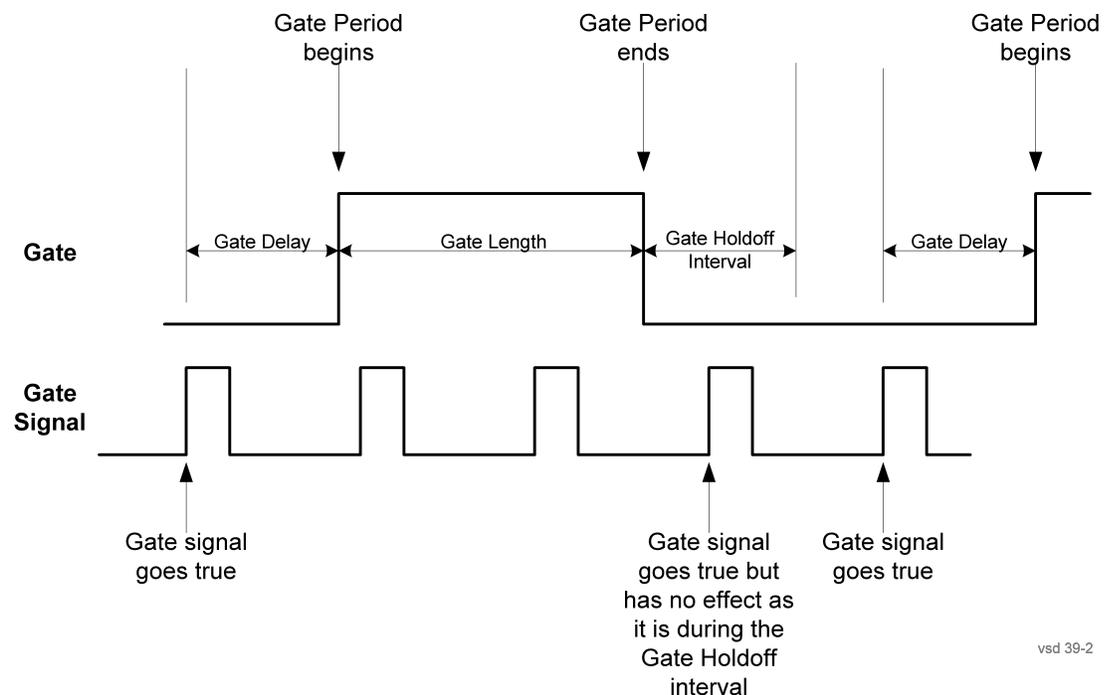

Remote Command `[:SENSe]:SWEep:EGATe:CONTrOl EDGE | LEVe1`

	<code>[:SENSe] :SWEp:EGATe:CONTrOl?</code>
Example	<code>:SWE:EGAT:CONT EDGE</code>
Dependencies	If the Gate Method is <code>FFT</code> , this control is grayed-out and <code>EDGE</code> is selected If the Gate Source is TV, Frame, or Line, this control is grayed-out and <code>EDGE</code> is selected
Preset	<code>EDGE</code>
State Saved	Saved in instrument state
Backwards	<code>[:SENSe] :SWEp:TIME:GATE:TYPE</code>
Compatibility SCPI	ESA Compatibility

8.3.7 Gate Holdoff

Enables you to increase or decrease the wait time after a gate event ends before the instrument will respond to the next gate signal.

After any Gate event finishes, the instrument must wait for the sweep system to settle before it can respond to another Gate signal. The instrument calculates a "wait time," taking into account a number of factors, including RBW and Phase Noise Optimization settings. The goal is to achieve the same accuracy when gated as in ungated operation. The figure below illustrates this concept:

8 Trigger
8.3 Gate Settings

When **Gate Holdoff** is Auto, the wait time calculated by the instrument is used. When Gate Time is in Manual, the user may adjust the wait time, usually decreasing it in order to achieve greater speed, but at the risk of decreasing accuracy.

When the **Method** control is set to **Video** or **FFT**, the **Gate Holdoff** function has no effect.

In measurements that do not support Auto, the value shown when Auto is selected is “---” and the manually set holdoff is returned to a query.

Remote Command	<pre>[:SENSe]:SWEep:EGATe:HOLDoff <time> [:SENSe]:SWEep:EGATe:HOLDoff? [:SENSe]:SWEep:EGATe:HOLDoff:AUTO OFF ON 0 1 [:SENSe]:SWEep:EGATe:HOLDoff:AUTO?</pre>
Example	<pre>:SWE:EGAT:HOLD 0.0002 :SWE:EGAT:HOLD? :SWE:EGAT:HOLD:AUTO ON :SWE:EGAT:HOLD:AUTO?</pre>
Couplings	<p>When Gate Holdoff is Auto, the Gate Holdoff control shows the value calculated by the instrument for the wait time</p> <p>Pressing the Gate Holdoff control while it is in Auto and not selected, causes the control to become selected and allows the user to adjust the value. If the value is adjusted, the setting changes to Man</p> <p>Pressing the Gate Holdoff key, while it is in Auto and selected, does not change the value of Gate Holdoff, but causes the setting to change to Man. Now the user can adjust the value</p> <p>Pressing the control while it is in Man and selected, cause the value to change back to Auto</p> <p>Pressing the control while it is in Man and not selected, causes the control to become selected and allows the user to adjust the value</p> <p>When Method is set to Video or FFT, the Gate Holdoff function has no effect</p>
Preset	<p>Auto</p> <p>Auto/On</p>
State Saved	Saved in instrument state
Range	Auto Man
Min	1 μsec
Max	1 sec

8.3.8 Gate View Sweep Time

Controls the Sweep Time in the Gate View window. To provide an optimal view of the gate signal, the instrument initializes Gate View Sweep Time based on the current settings of Gate Delay and Gate Length.

NOTE Since Gate View Sweep Time is used to calculate Gate Delay and Gate Length increments, it is maintained even when not in Gate View.

NOTE In instruments without sweeping hardware such as some modular analyzers, this control may be labeled “Gate View Acquisition Time”

Remote Command	<code>[:SENSe]:SWEep:EGATe:TIME <time></code> <code>[:SENSe]:SWEep:EGATe:TIME?</code>
Example	<code>:SWE:EGAT:TIME 500 ms</code>
Dependencies	Gate View Sweep Time is initialized: <ul style="list-style-type: none"> – On Preset (after initializing delay and length) – Every time the Gate Method is set/changed <p>Additionally, in the Swept SA measurement, whenever you do a Preset, or leave Gate View, the instrument remembers the Gate Delay and Gate Length settings. Then, when returning to Gate View, if the current Gate Delay and/or Gate Length do not match the remembered values Gate View Sweep Time is re-initialized</p>
Preset	WiMAX OFDMA: 5 ms GSM/EDGE: 1 ms 5G NR: 10 ms Others: 800 μ s
State Saved	Saved in instrument state
Min	1 μ s
Max	6000 s
Annotation	The gate view Sweep Time is displayed in the lower-right corner of the gate view window

8.3.9 Gate View Start Time

Controls the time at the left edge of the Gate View.

Remote Command	<code>[:SENSe]:SWEep:EGATe:VIEW:STARt <time></code> <code>[:SENSe]:SWEep:EGATe:VIEW:STARt?</code>
Example	<code>:SWE:EGAT:VIEW:STAR 10ms</code>
Notes	Units of time are required or no units; otherwise an invalid suffix error message is generated
Preset	0 ms
State Saved	Saved in instrument state
Min	0
Max	500 ms

8.3.10 Gate Delay Compensation

Allows you to select an RBW-dependent value by which to adjust the gate delay, to compensate for changes in the delay caused by RBW effects. You can select between uncompensated operation and two types of compensation:

Uncompensated	OFF
Delay Until RBW Settled	SETTled
Compensate for RBW Group Delay	GDElay

For full details of these options, see ["More Information" on page 3315](#)

Remote Command	<code>[:SENSe] :SWEep :EGATe :DELay :COMPensation :TYPE OFF SETTled GDElay</code> <code>[:SENSe] :SWEep :EGATe :DELay :COMPensation :TYPE ?</code>
Example	<code>:SWE :EGAT :DEL :COMP :TYPE SETT</code> <code>:SWE :EGAT :DEL :COMP :TYPE ?</code>
Notes	<p>Although this function is Meas Global, there are some measurements that do not support this function. In those measurements the control is not displayed, and the operation will be Uncompensated</p> <p>If some but not all measurements in a Mode support this function, then selecting a measurement that does not support it will not change the Meas Global selection; it will simply be “Uncompensated” while in that measurement. The SCPI command is still accepted while in that measurement</p> <p>If Gate Delay Compensation is not supported at all within a particular mode, the control is not displayed, and if the SCPI command is sent while in a measurement within that mode, an “Undefined Header” message is generated</p> <p>Note that, for modular products such as EXM and VXT, this function is not supported. In those products the control is not displayed and the SCPI is ignored, although it is accepted without error</p>
Preset	TD-SCDMA, LTEA FDD/TDD, 5G NR modes: GDElay All other modes: SETTled
State Saved	Saved in instrument state
Range	OFF SETTled GDElay

More Information

Selecting **Uncompensated** means that the actual gate delay is as you set it.

Selecting **Delay Until RBW Settled** causes the gate delay to be increased above the user setting by an amount equal to $3.06/\text{RBW}$. This compensated delay causes the GATE START and GATE STOP lines on the display to move by the compensation amount, and the actual hardware gate delay to be increased by the same amount. All the other gate lines (for example, MIN FAST) are unaffected. If the RBW subsequently changes, the compensation is readjusted for the new RBW. The value shown on the **Gate Delay** control does *not* change.

Delay Until RBW Settled allows excellent measurements of gated signals, by allowing the IF to settle following any transient that affects the burst. Excellent measurements also require that the analysis region not extend into the region affected by the falling edge of the burst. Thus, excellent measurements can only be made over a width that declines with narrowing RBWs, which is achieved by decreasing the gate length below the user setting by an amount equal to $2.53/\text{RBW}$. Therefore, for general purpose compensation, you will still want to change the gate length with changes in RBW even if the gate delay is compensated. The compensated Gate Length is limited by the instrument so that it will never go below 10% of the value shown on the Gate Length key, as otherwise the sweep times could get very long. Anytime the **Gate Length** and **RBW** values combine in such a way that this limiting takes place, a warning is displayed. For measurements that contain multiple sweeps with different RBW like SEM and SPUR, the smallest RBW is used for this limiting.

Selecting **Compensate for RBW Group Delay** causes the gate delay to be increased above the user setting by an amount equal to $1.81/\text{RBW}$. This compensated delay causes the GATE START, GATE STOP lines on the display to move by the compensation amount, and the actual hardware gate delay to be increased by the same amount. All the other gate lines (for example, MIN FAST) are unaffected. If the RBW subsequently changes, the compensation is readjusted for the new RBW. The value shown on the **Gate Delay** control does *not* change. **Compensate for RBW Group Delay** also includes gate length compensation; the gate length itself is adjusted as necessary to attempt to compensate for delay effects imposed by the RBW.

Compensate for RBW Group Delay is similar to **Delay Until RBW Settled**, but compensates for the group delay of the RBW filter, rather than the filter settling time. As the RBW gets narrow, this can allow the settling tail of the RBW to affect the beginning part of the gated measurement, and allow the beginning of the RBW settling transient to affect the end of the gated measurement. These two effects are symmetric because the RBW response is symmetric. Because the gate length is not automatically compensated, some users might find this compensation to be more intuitive than compensation for RBW settling.

8.3.11 Min Fast Position Query (Remote Command Only)

Queries the position of the MIN FAST line, relative to the delay reference (REF) line. See "[Gate View On/Off](#)" on page 3306. If this query is sent while not in Gate view, the MinFast calculation is performed based on the current values of the appropriate parameters and the result is returned. Reading this value lets you set an optimal gate delay value for the current measurement setup.

Example	<code>:SWE:EGAT:MIN?</code>
Backwards Compatibility SCPI	<code>[:SENSe] :SWEep:EGATe:MINFast?</code>

8.3.12 Gate Preset (Remote Command Only)

Presets the time-gated spectrum analysis capability.

This command sets gate parameter values to the ESA preset values, as follows:

- Gate trigger type = edge
- Gate polarity = positive
- Gate delay = 1 us
- Gate length = 1 us

Backwards Compatibility	<code>[:SENSe] :SWEep :TIME :GATE :PRESet</code>
SCPI	ESA Compatibility

8.3.13 Gate Level (Remote Command Only)

Sets the gate input transition point level for the external TRIGGER inputs on the front and rear panel. This is a legacy command for PSA compatibility. It is simply an alias to the equivalent trigger level command.

Notes	This command is simply an alias to <code>:TRIGger[:SEQuence]:EXTernal[1] 2:LEVel</code>
Backwards Compatibility	<code>[:SENSe] :SWEep :EGATe :EXTernal [1] 2 :LEVel <voltage></code>
SCPI	<code>[:SENSe] :SWEep :EGATe :EXTernal [1] 2 :LEVel?</code>

8.3.14 Gate Polarity (Remote Command Only)

Sets the polarity for the gate signal. This setup is now done using the gate trigger's slope setting.

When **POSitive** is selected, a positive-going edge (Edge) or a high voltage (Level) will satisfy the gate condition, after the delay set with the Gate Delay key. When **NEGative** is selected, a negative-going edge (Edge) or a low voltage (Level) will satisfy the gate condition after the delay.

Example	<code>:SWE:EGAT:POL NEG</code> <code>:SWE:EGAT:POL?</code>
Preset	<code>POSitive</code>

State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>[:SENSe]:SWEep:TIME:GATE:POLarity</code> ESA compatibility <code>[:SENSe]:SWEep:EGATE:POLarity</code> <code>NEGative</code> <code>POSitive</code> <code>[:SENSe]:SWEep:EGATE:POLarity?</code>
Preset	<code>HIGH</code>
Backwards Compatibility SCPI	<code>[:SENSe]:SWEep:TIME:GATE:LEVel</code> <code>HIGH</code> <code>LOW</code> <code>[:SENSe]:SWEep:TIME:GATE:LEVel?</code> ESA compatibility

8.4 Periodic Sync Src

Contains controls that let you select and configure the sync signal for the Periodic Timer Trigger.

For convenience controls for adjusting the level and slope of the selected sync source are provided here. Note that these settings match those in the **Trigger** and **Gate Source** menus; that is, each trigger source has only one value of level and slope, regardless of which menu it is accessed from.

8.4.1 Select Periodic Timer Sync Source

Selects a signal source for you to synchronize your periodic timer trigger to, otherwise you are triggering at some arbitrary location in the frame. Synchronization reduces the precision requirements on the setting of the period.

Note that, with Sync Source **OFF**, the timing will drift unless the signal source frequency is locked to the instrument frequency reference.

Remote Command	<code>:TRIGger[:SEquence]:FRAMe:SYNC EXTerna1 EXTerna2 RFBurst PXI INTerna1 OFF</code> <code>:TRIGger[:SEquence]:FRAMe:SYNC?</code>
Example	<code>:TRIG:FRAM:SYNC EXT1</code> <code>:TRIG:FRAM:SYNC EXT2</code> <code>:TRIG:FRAM:SYNC RFB</code> <code>:TRIG:FRAM:SYNC OFF</code>
Dependencies	PXI and INTerna1 triggers are only found in modular analyzers such as VXT This control is not available in the E7760 or UXM In some models, there is no second External input. In these models, the External 2 selection is not shown, and the EXTerna2 parameter generates a "Hardware missing; Not available for this model number" message
Preset	OFF GSM/EDGE, LTE, LTETDD, 5G NR: RFBurst
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:TRIGger[:SEquence]:FRAMe:SYNC EXTerna1</code> For backward compatibility, the parameter EXTerna1 is mapped to EXTerna11

8.5 Auto/Holdoff

Contains controls that let you adjust Auto Trigger and Trigger Holdoff parameters

This tab does not appear in Spectrum Analyzer Mode in VXT models SP900B/21A.

8.5.1 Trig Holdoff

Sets the holdoff time between triggers. When the trigger condition is satisfied, the trigger occurs, the delay begins, and the holdoff time begins. New trigger conditions will be ignored until the holdoff time expires. For a free-running trigger, the holdoff value is the minimum time between triggers.

Remote Command	<pre>:TRIGger[:SEquence]:HOLDoff <time> :TRIGger[:SEquence]:HOLDoff? :TRIGger[:SEquence]:HOLDoff:STATe OFF ON 0 1 :TRIGger[:SEquence]:HOLDoff:STATe?</pre>
Example	<pre>:TRIG:HOLD:STAT ON :TRIG:HOLD 100 ms</pre>
Dependencies	Unavailable if the selected Input is BBIQ . If this is the case, the control is grayed-out if it is pressed the informational message “Feature not supported for this Input” is displayed. If the SCPI command is sent, the error “Settings conflict; Feature not supported for this Input” is generated
Preset	Off, 100 ms All modes but GSM/EDGE: OFF GSM/EDGE mode: ON
State Saved	Saved in instrument state
Min	0 s
Max	0.5 s VXT models SP900B/11A: 2. 86 s

8.5.2 Auto Trig

Sets the time that the instrument will wait for the trigger conditions to be met. If they are not met after that much time, then the instrument is triggered anyway.

Remote Command	<pre>:TRIGger[:SEquence]:ATRigger <time> :TRIGger[:SEquence]:ATRigger? :TRIGger[:SEquence]:ATRigger:STATe OFF ON 0 1 :TRIGger[:SEquence]:ATRigger:STATe?</pre>
----------------	--

8 Trigger
8.5 Auto/Holdoff

Example	<code>:TRIG:ATR:STAT ON</code> <code>:TRIG:ATR 100 ms</code>
Notes	The "time that the instrument will wait" starts when the instrument is ready for a trigger, which may be hundreds of ms after the data acquisition for a sweep is done. The "time" ends when the trigger condition is satisfied, not when the delay ends
Dependencies	Not available in Real Time Spectrum Analyzer Mode
Preset	Off, 100 ms <code>OFF</code>
State Saved	Saved in instrument state
Min	1 ms
Max	100 s

8.5.3 Holdoff Type

Enables you to set the Trigger Holdoff Type.

NOTE

Holdoff Type is not supported by all measurements. If the current measurement does not support it, this control will not appear and the Holdoff Type will be Normal. If the Holdoff Type SCPI is sent while in such a measurement, the SCPI will be accepted and the setting remembered, but it will have no effect until a measurement is in force that supports Holdoff Type.

Trigger Holdoff Type functionality

NORMa1	This is the "oscilloscope" type of trigger holdoff, and is the setting when the Holdoff Type control does not appear. In this type of holdoff, no new trigger will be accepted until the holdoff interval has expired after the previous trigger
ABOVe	If the trigger slope is positive, a trigger event is generated only if the signal characteristic of interest crosses the trigger threshold (with positive slope) and then remains above the threshold for at least the holdoff time. For negative slope, the trigger event is generated if the signal characteristic crosses the threshold (with negative slope) after having been above the threshold for at least the holdoff time. In either case, the trigger event is associated with the time the level was crossed
BELow	If the trigger slope is positive, a trigger event is generated only if the signal characteristic of interest crosses the trigger threshold (with positive slope) after having been below the threshold for at least the holdoff time. For negative slope, the trigger event is generated if the signal characteristic crosses the threshold (with negative slope) and then remains below the threshold for at least the holdoff time. In either case, the trigger event is associated with the time the level was crossed

Remote Command	<code>:TRIGger[:SEquence]:HOLDoff:TYPE NORMa1 ABOVe BELow</code> <code>:TRIGger[:SEquence]:HOLDoff:TYPE?</code>
----------------	--

Example	:TRIG:HOLD:TYPE NORM
Preset	All modes but GSM/EDGE: NORMa1 GSM/EDGE, Bluetooth: BELow
State Saved	Saved in instrument state

9 Programming the Instrument

This section provides information about the instrument's SCPI programming interface. You can also operate the instrument remotely using some legacy programming languages by running the N9061C Remote Language Compatibility measurement application and the N9062C SCPI Language Compatibility measurement application.

9.1 List of Supported SCPI Commands

The SCPI commands available while using this application are listed below.

To find a command in the list, search according to its first alphanumeric character, ignoring any leading ":" or "[" characters. The sole exception to this is the asterisk [*] prefix, identifying IEEE 488.2 Common commands and queries; all these appear at the start of the list.

9.2 IEEE 488.2 Common Commands

The instrument supports the following subset of IEEE 488.2 Common Commands, as defined in Chapter 10 of [IEEE Standard 488.2–1992](#). As indicated below, some of these commands correspond directly to instrument front-panel functionality, while others are available only as remote commands.

- ["*CAL? - Calibration Query" on page 3405](#) (Align Now All equivalent)
- ["*CLS - Clear Status" on page 3406](#)
- ["*ESE - Standard Event Status Enable" on page 3406](#)
- ["*ESR? - Standard Event Status Register Query" on page 3407](#)
- ["*IDN? - Identification Query" on page 3407](#)
- ["*OPC? - Operation Complete" on page 3408](#)
- ["*OPT? - Query Instrument Options" on page 3409](#)
- ["*RCL - Recall Instrument State" on page 3409](#) (Recall State equivalent)
- ["*RST - Reset" on page 3409](#) (Mode Preset equivalent)
- ["*SAV - Save Instrument State" on page 3410](#) (Save State equivalent)
- ["*SRE - Service Request Enable" on page 3410](#)
- ["*STB? - Status Byte Query" on page 3411](#)
- ["*TRG - Trigger" on page 3411](#)
- ["*TST? - Self Test Query" on page 3411](#)
- ["*WAI - Wait-to-Continue" on page 3412](#)

9.2.1 *CAL? - Calibration Query

***CAL?** Performs a full alignment and returns a number indicating the success of the alignment. A zero is returned if the alignment is successful. A one is returned if any part of the alignment fails. The equivalent SCPI command is [:CALibrate\[:ALL\]?](#)

See ["Align Now All" on page 2753](#)

Remote Command

***CAL**

Example	*CAL? Runs a full alignment and returns 0 if no problems encountered
Status Bits/OPC dependencies	See "Align Now All" on page 2753

9.2.2 *CLS - Clear Status

Clears the ["Status Byte Register" on page 3442](#), by emptying the error queue and clearing all bits in all of the event registers, and consequently all bits in the Status Byte Register.

The Status Byte Register summarizes the states of the other registers. It is also responsible for generating service requests.

Remote Command	*CLS
Example	*CLS Clears the error queue and the Status Byte Register
Notes	For related commands, see :SYSTem:ERRor[:NEXT]? See also :STATus:PRESet and all commands in the "Status Register System & STATus Subsystem" on page 3433
Status Bits/OPC dependencies	Resets all bits in all event registers to 0, which resets all the status byte register bits to 0 also

9.2.3 *ESE - Standard Event Status Enable

Sets the desired bits in the Event Enable sub-register of the ["Standard Event Status Register" on page 3446](#), which enables the corresponding bits in the Standard Event Status Register. This register monitors I/O errors and synchronization conditions such as operation complete, request control, query error, device-dependent error, status execution error, command error, and power on. The selected bits are **ORed** to become a summary bit (bit 5) in the ["Status Byte Register" on page 3442](#), which can be queried.

The query returns the state of this register.

Numeric values for bit patterns can be entered using decimal or hexadecimal representations (0 to 32767, equivalent to **#H0** to **#H7FFF**).

Remote Command	*ESE <integer> *ESE?
Example	*ESE 36 Enables the Standard Event Status Register to monitor query and command errors (bits 2 and 5)

	*ESE?
	Returns a 36 indicating that the query and command status bits are enabled
Notes	For related commands, see the "Status Register System & STATus Subsystem" on page 3433 and :SYSTem:ERRor[:NEXT]?
Preset	255
State Saved	Not saved in state
Min	0
Max	255

9.2.4 *ESR? - Standard Event Status Register Query

Queries and clears the ["Standard Event Status Register" on page 3446](#). (This is a destructive read.) The value returned is a hexadecimal number that reflects the current state (0/1) of all the bits in the register.

Remote Command	*ESR?
Example	*ESR? Returns a 1 if there is either a query or command error, otherwise it returns a zero
Notes	For related commands, see "Status Register System & STATus Subsystem" on page 3433
Min	0
Max	255
Status Bits/OPC dependencies	Standard Event Status Register (bits 0 - 7)

9.2.5 *IDN? - Identification Query

Returns a string of instrument identification information. The string contains the model number, serial number, and firmware revision.

The response is organized into four fields separated by commas. The field definitions are as follows:

1. Manufacturer
2. Model
3. Serial number
4. Firmware version

Remote Command	*IDN?
----------------	--------------

Example	*IDN? Returns instrument identification information, such as: Keysight Technologies,SP900S,US01020004,A.15.02
Example	:ID? Returns model number, such as: SP900S
Notes	Provided for backwards compatibility: In Remote Language Compatibility Mode, ID? returns the model number of the emulated instrument In any other Mode, the returned model number is that of the actual instrument
Backwards Compatibility SCPI	:ID?

9.2.6 *OPC? - Operation Complete

Sets bit 0 in the "Standard Event Status Register" on page 3446 (SESR) to "1" when pending operations have finished, that is when all overlapped commands are complete. It does not hold off subsequent operations. You can determine when the overlapped commands have completed either by polling the OPC bit in SESR, or by setting up the status system so that a service request (SRQ) is asserted when the OPC bit is set.

***OPC?** returns "1" after all the current overlapped commands are complete, so it holds off subsequent commands until the "1" is returned, then the program continues. This query can be used to synchronize events of other instruments on the external bus.

Remote Command	*OPC *OPC?
Example	:INIT:CONT 0 Selects single sweeping :INIT:IMM Initiates a sweep *OPC? Holds off any further commands until the sweep is complete
Notes	Not global to all remote ports or front panel. *OPC only affects operations that were initiated on the same port that the *OPC command was issued from *OPC is an overlapped command, but *OPC? is sequential *OPC? does <i>not</i> holdoff the completion of GUI update commands , such as :MMEM:LOAD:SCON "myScreenConfig.screen"

9.2.7 *OPT? - Query Instrument Options

Returns a string of all installed instrument options. It is a comma separated list with quotes, such as:

```
"550,B25,B40,BBA,CRP,CRW,EA3,EDP,ESC,EXM,FBP,LNP,MPB,NF2,RTS,EMC,FP2"
```

Remote Command ***OPT?**

9.2.8 *RCL - Recall Instrument State

Recalls the instrument state from the specified instrument memory register.

If the state being loaded has a newer firmware revision than the revision of the instrument, no state is recalled and an error is reported

If the state being loaded has an equal firmware revision than the revision of the instrument, the state will be loaded

If the state being loaded has an older firmware revision than the revision of the instrument, then the instrument will only load the parts of the state that apply to the older revision

Remote Command	*RCL <register #>
Example	*RCL 7 Recalls the instrument state that is currently stored in register 7 (register 8 in the UI)
Notes	Registers 0 through 15 are accessible from the front panel in menu keys for Recall Registers. Register 0 corresponds to the front panel Register 1
Min	0
Max	127
Status Bits/OPC dependencies	The command is sequential

9.2.9 *RST - Reset

***RST** is equivalent to **:SYST:PRES;:INIT:CONT OFF**, which is a Mode Preset in the **Single** measurement state. This command is preferred over the Mode Preset command **:SYST:PRES**, because optimal remote programming occurs with the instrument in the **Single** measurement state.

***RST** clears all pending OPC bits and sets the Status Byte to 0.

Remote Command ***RST**

Example	<code>*RST</code>
Notes	Sequential
Couplings	<code>*RST</code> causes the currently running measurement to be aborted and causes the default measurement to be active. <code>*RST</code> gets the mode to a consistent state, with all of the default couplings set
Status Bits/OPC dependencies	Clears all pending OPC bits. The "Status Byte Register" on page 3442 is set to 0

9.2.10 *SAV - Save Instrument State

Saves the current instrument state and mode to the specified instrument memory register.

Remote Command	<code>*SAV <register #></code>
Example	<code>*SAV 9</code> Saves the instrument state in register 9 (register 10 in the UI)
Notes	Registers 0 through 15 are accessible from the front panel in menu keys for Save Registers. Register 0 corresponds to the front panel Register 1
Min	0
Max	127
Status Bits/OPC dependencies	The command is sequential

9.2.11 *SRE - Service Request Enable

Enables the desired bits of the "Service Request Enable Register" on page 3445.

The query returns the value of the register, indicating which bits are currently enabled.

Numeric values for bit patterns can be entered using decimal or hexadecimal representations (0 to 32767, equivalent to #H0 to #H7FFF).

Remote Command	<code>*SRE <integer></code> <code>*SRE?</code>
Example	<code>*SRE 22</code> Enables bits 1, 2, and 4 in the service request enable register
Notes	For related commands, see "Status Register System & STATus Subsystem" on page 3433 and <code>:SYSTEM:ERROR[:NEXT]?</code>
Preset	0
Min	0

Max	255
Status Bits/OPC dependencies	Service Request Enable Register (all bits, 0 – 7)

9.2.12 *STB? - Status Byte Query

Returns the value of the "Status Byte Register" on page 3442 without erasing its contents.

Remote Command	*STB?
Example	*STB? Returns a decimal value for the bits in the Status Byte Register For example, if a 16 is returned, it indicates that bit 5 is set and one of the conditions monitored in the standard event status register is set
Notes	See related command " *CLS - Clear Status " on page 3406
Status Bits/OPC dependencies	Status Byte Register (all bits, 0 – 7)

9.2.13 *TRG - Trigger

Triggers the instrument. Use :TRIGger[:SEquence]:SOURce to select the trigger source.

Remote Command	*TRG
Example	*TRG Triggers the instrument to take a sweep or start a measurement, depending on the current instrument settings
Notes	See related command :INITiate:IMMEDIATE

9.2.14 *TST? - Self Test Query

Performs the internal self-test routines and returns a number indicating the success of the testing. The value returned is 0 if the test is successful, or 1 if it fails.

Remote Command	*TST?
Example	*TST? Runs the self-test routines and returns 0=passed, 1=some part failed

9.2.15 *WAI - Wait-to-Continue

Causes the instrument to wait until all overlapped commands are completed before executing any additional commands. There is no query form.

Remote Command	<code>*WAI</code>
Example	<code>:INIT:CONT OFF; INIT;*WAI</code> Sets the instrument to single sweep. Starts a sweep and waits for its completion
Notes	<code>*WAI</code> does <i>not</i> wait for the completion of user-interface-related commands, such as <code>:MMEM:LOAD:SCON "myScreenConfig.screen"</code>
Status Bits/OPC dependencies	Not global to all remote ports or front panel. <code>*OPC</code> only considers operation that was initiated on the same port that the <code>*OPC</code> command was issued from

9.3 SCPI Operation and Results Query

You can use SCPI commands for remote control of measurements and querying of measurement results data. There are several alternative commands you can use to control the measurement, depending on how you wish to operate the instrument. There are also a number of queries that you can use to extract the measurement data.

In this section, “Mode” refers to a Measurement Application, for example, Spectrum Analyzer or 5G NR.

9.3.1 Mode Control

Use either `:INSTRument:SElect` or `:INSTRument:NSElect` to select the Mode. See ["Mode" on page 112](#).

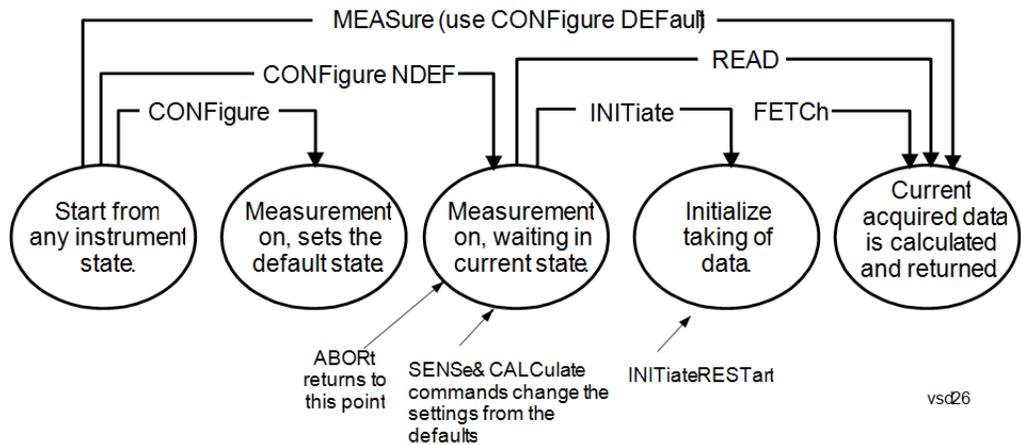

`:INSTRument:CONFigure` causes a Mode *and* Measurement switch at the same time. This results in faster overall switching than sending `:INSTRument:SElect` and `:CONFigure` separately, as described in ["Mode" on page 112](#).

9.3.2 Measurement Control

This section describes the measurement control commands listed below, and their functions.

"CONFigure" on page 3414	Switches to the desired measurement
"INITiate" on page 3415	Starts the measurement
"FETCh" on page 3415	Queries the data
"READ" on page 3416	Starts the measurement and queries the data
"MEASure" on page 3417	Switches to the desired measurement, starts the measurement and queries the data

The relationship between the command forms is illustrated in the diagram below. `:FETCh`, `:READ` and `:MEASure` are queries that return measurement data.

9.3.2.1 CONFigure

Stops the current measurement (if any) and sets up the instrument for the specified measurement using the factory default instrument settings. Does not initiate the collection of measurement data unless `:INIT:CONT` is `ON`. If you change any measurement settings after using `:CONFigure`, `"READ"` on page 3416 can be used to initiate a measurement without changing the settings back to their defaults.

Normally `:CONFigure` presets the measurement after selecting it; but, if sent with the `NDEFault` parameter, it selects it without performing a Preset.

Remote Command	<code>:CONFigure:<measurement>[:NDEFault]</code> <code>:CONFigure?</code>
Example	Select and preset the Swept SA measurement: <code>:CONF:SAN</code> Select the Swept SA measurement <i>without</i> presetting: <code>:CONF:SAN:NDEF</code> Query the current measurement: <code>:CONF?</code>
Remote Command	<code>:CONFigure:CATalog?</code>
Example	<code>:CONF:CATalog?</code> returns a quoted string of all licensed measurement names in the current mode. For example, <code>"SAN, CHP, OBW, ACP, PST, TXP, SPUR, SEM, LIST"</code> for the Spectrum Analyzer mode

9.3.2.2 INITiate

Initiates a trigger cycle for the specified measurement, but does not output any data. You must then use `:FETCh<meas>` to return data. If a measurement other than the current one is specified, the instrument will switch to that measurement and then initiate it.

Remote Command `:INITiate:<measurement>`

Example Switch to the `SANalyzer` (Swept SA) measurement if not already there, then start the measurement:
`:INIT:SAN`

`:INITiate` does not change any of the measurement settings. For example, if you have already run the ACP measurement and you send `:INIT:ACP?` it initiates a new ACP measurement using the same instrument settings as the last time ACP was run.

If another measurement is running, `:INIT` switches to the specified measurement. For example, suppose you are running the channel power measurement. If you send `:INIT:ACP?` it changes from channel power to ACP and initiates an ACP measurement.

If your selected measurement is currently in the idle state, it triggers the measurement, assuming the trigger conditions are met. Then it completes one trigger cycle. Depending upon the measurement and the number of averages, there may be multiple data acquisitions, with multiple trigger events, for one full trigger cycle.

`:INIT` also holds off additional commands until the acquisition is complete.

9.3.2.3 FETCh

Places selected data from the most recent measurement into the output buffer.

Use `:FETCh` if you have already made a valid measurement and you want to retrieve data. You can issue `:FETCh` multiple times with differing `[n]` values without restarting or re-making the measurement, for example, both scalars and trace data from a single measurement.

Remote Command `:FETCh:<measurement>[n]?`

Example Fetch item 2 (Trace 2) from the `SAN` (Swept SA) measurement when the measurement completes. If not in the Swept SA measurement, returns an error:
`:FETCh:SAN2?`

:FETCh does not change any of the measurement settings, it simply reads the results of the current measurement. **:FETCh** may be used to return results other than those specified with the original **:READ** or **:MEASure** query that you sent.

You can only **:FETCh** results from the measurement that is currently active, it does not change to a different measurement. An error message is reported if a measurement other than the current one is specified.

If you need to get new measurement data, use **"READ"** on page 3416, which is equivalent to **"INITiate"** on page 3415 followed by **:FETCh**.

The measurement results for **n = 1** (usually the scalar result) will be returned if the optional **[n]** value is not included, or is set to 1. If the **[n]** value is set to a value other than 1, the selected data results will be returned. See each measurement for details of what types of scalar results or trace data results are available. The binary data formats should be used for handling large blocks of data since they are smaller and transfer faster than the ASCII format. See **"Format Data: Numeric Data (Remote Command Only)"** on page 3420.

Note that the data returned by **:FETCh?** uses the data setting specified by **"Format Data: Numeric Data (Remote Command Only)"** on page 3420 and **"Format Data: Byte Order (Remote Command Only)"** on page 3421 commands, and can return real or ASCII data. If the format is set to **INT, 32**, it returns **REAL, 32** data.

9.3.2.4 READ

Initiates a trigger cycle for the specified measurement and outputs the requested data. If a measurement other than the current one is specified, the instrument will switch to that measurement before it initiates the measurement and returns results.

Remote Command	:READ:<measurement>[n]?
----------------	--------------------------------------

Example	Switch to the SANalyzer (Swept SA) measurement if not already there, start the measurement, and return item 2 (Trace 2) from the measurement when the measurement completes:
---------	---

:READ:SAN2?

:READ does not change any of the measurement settings. For example, if have already run the ACP measurement and you send **:READ:ACP?**, it initiates a new ACP measurement using the same instrument settings as the last time ACP was run.

:READ switches to the specified measurement if the instrument is not already there. For example, suppose you have already run the ACP measurement but now you are running the Channel Power measurement. When you send **:READ:ACP?**, it changes from Channel Power back to ACP and, using the previous ACP settings, initiates the measurement and return results.

The measurement results for $n = 1$ (usually the scalar result) will be returned if the optional $[n]$ value is not included, or is set to 1. If the $[n]$ value is set to a value other than 1, the selected data results will be returned. See each measurement for details of what types of scalar results or trace data results are available. The binary data formats should be used for handling large blocks of data since they are smaller and transfer faster than the ASCII format. See ["Format Data: Numeric Data \(Remote Command Only\)" on page 3420](#).

Note that the data returned by `:READ?` uses the data setting specified by ["Format Data: Byte Order \(Remote Command Only\)" on page 3421](#)) and ["Format Data: Numeric Data \(Remote Command Only\)" on page 3420](#), and can return real or ASCII data. If the format is set to `INT, 32` it returns `REAL, 32` data.

`:READ` holds off additional commands until the acquisition is complete.

9.3.2.5 MEASure

Stops the current measurement (if any) and sets up the instrument for the specified measurement using the factory default instrument settings, initiates a trigger cycle for the specified measurement, and outputs the requested data.

Remote Command `:MEASure: <measurement> [n]?`

Example Switch to the [SANAlyzer](#) (Swept SA) measurement, start the measurement, and read back item 2 (Trace 2) when the measurement completes

`:MEAS: SAN2?`

This is a fast single-command way to make a measurement using the factory default instrument settings. These are the settings and units that conform to the Mode Setup settings (for example, Radio Standard) that you have currently selected.

Stops the current measurement (if any) and sets up the instrument for the specified measurement using the factory defaults

Initiates the data acquisition for the measurement

Blocks other SCPI communication, waiting until the measurement is complete before returning results

If the function does averaging, it is turned on and the number of averages is set to 10

After the data is valid it returns the scalar results, or the trace data, for the specified measurement. The type of data returned may be defined by an $[n]$ value that is sent with the command

If the optional $[n]$ value is not included, or is set to 1, scalar measurement results will be returned. If the $[n]$ value is other than 1, the selected trace data results will

be returned. See each command for details of which types of scalar results or trace data results are available

The default format for data output is ASCII. (Older versions of Spectrum Analysis and Phase Noise mode measurements only use ASCII.) The binary data formats should be used for handling large blocks of data, because transfers are smaller and faster than when using the ASCII format. See "[Format Data: Numeric Data \(Remote Command Only\)](#)" on page 3420 for more information

If you need to change some of the measurement parameters from the factory default settings, you can set up the measurement with `:CONFigure`. Use the commands in the `:SENSe:<measurement>` and `:CALCulate:<measurement>` subsystems to change the settings, then you can use `:READ?` to initiate the measurement and query the results.

If you need to repeatedly make a given measurement with settings other than the factory defaults, you can use the commands in the `:SENSe:<measurement>` and `:CALCulate:<measurement>` subsystems to set up the measurement, then use `:READ?` to initiate the measurement and query results.

Measurement settings persist if you initiate a different measurement and then return to a previous one. Use `:READ:<measurement>?` if you want to use those persistent settings. If you want to go back to the default settings, use `:MEASure:<measurement>?`

Note that the data returned to `:MEASure?` uses the data setting specified by "[Format Data: Byte Order \(Remote Command Only\)](#)" on page 3421 and "[Format Data: Numeric Data \(Remote Command Only\)](#)" on page 3420, and can return real or ASCII data. If the format is set to `INT, 32` it returns `REAL, 32` data.

9.3.3 Trace Formatting Commands

The following commands and queries are available to format and manipulate trace data.

9.3.3.1 Clear Trace (Remote Command Only)

Clears the selected trace (from the front panel) or the specified trace (from SCPI). Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points in the selected trace, unless the trace is in Min Hold in which case it loads `maxtracevalue`. This occurs even if `Update = Off`.

Remote Command	<code>:TRACe:CLEAr TRACE1 ... TRACE6</code>
Example	<code>:TRAC:CLE TRACE1</code> Clears trace 1

9.3.3.2 Send/Query Trace Data (Remote Command Only)

Allows trace data to be sent to the instrument or queried from the instrument. The response to the query is a list of the amplitude points which comprise the requested trace in the current Y Axis Unit of the instrument. The X Axis Unit is that of the destination trace (for send) or the source trace (for query).

See:

- ["Query Trace Data" on page 3419](#)
- ["More Information" on page 3419](#)

Remote Command	<code>:TRACe[:DATA] TRACE1 TRACE2 TRACE3 TRACE4 TRACE5 TRACE6, <data></code>
Notes	<p>The <code>TRACe[:DATA]</code> command is of the form: <code>:TRACe:DATA <trace>,<data></code></p> <p>where <code><trace></code> can be one of the following parameters: <code>TRACE1, TRACE2, TRACE3, TRACE4, TRACE5, TRACE6</code></p> <p>and where <code><data></code> can be</p> <ul style="list-style-type: none"> - ASCII data, which consists of a string of values separated by comma or - <code>REAL</code> or <code>INTEger</code> sent as a definite length block, with a header describing the data to follow
Couplings	<p>Sweep points will affect the amount of data</p> <p><code>:FORMat:DATA</code> describes the different types of data formats that can be used with trace data</p> <p>Use <code>:FORMat:BORDER</code> to set the byte order</p> <p>Query Trace Data</p>
Remote Command	<code>:TRACe[:DATA]? TRACE1 TRACE2 TRACE3 TRACE4 TRACE5 TRACE6</code>
Example	<p>Send five points to Trace 1. Assuming that <code>:FORMat:DATA</code> is set to <code>ASCii</code>, Y Axis Unit is set to dBm, and sweep points is set to 5, this will result in Trace 1 consisting of the five points -1 dBm, -2 dBm, -3 dBm, -4 dBm, and -5 dBm:</p> <p><code>:TRAC TRACE1, -1, -2, -3, -4, -5</code></p> <p>Query the instrument for the contents of trace 2:</p> <p><code>:TRAC? TRACE2</code></p>
Backwards Compatibility Notes	<p>In X-Series, the legacy <code>RAWTRACE, LLINE1, LLINE2</code> parameters for trace data query are no longer available</p> <p>More Information</p>

The format and byte order of the sent or received data depend on "[Format Data: Numeric Data \(Remote Command Only\)](#)" on page 3420 and "[Format Data: Byte Order \(Remote Command Only\)](#)" on page 3421. **ASCII** data consists of a string of comma separated values. **REAL** or **INTEger** data is sent as a definite length block, with a header describing the data to follow.

For example, a four point trace might look like this if in ASCII (**FORMat:DATA ASCii**):

```
-5.87350E+01, -5.89110E+01, -5.87205E+01, -5.12345E+01<NL><END>
```

and like this if in **INTEger** with 4 bytes per point (**FORMat:DATA INT,32**):

```
#216<16 bytes of data><NL><END>
```

where the 2 in the #216 means "2 digits of numeric data to follow", and the 16 is the 2 digits and means "16 binary bytes to follow" (this is the definite length block format).

Note that the data is terminated with **<NL><END>**. (For GPIB this is newline, or linefeed, followed by EOI set true. For LAN, this is newline only.)

The data format set by "[Format Data: Numeric Data \(Remote Command Only\)](#)" on page 3420 and "[Format Data: Byte Order \(Remote Command Only\)](#)" on page 3421 is used both for sending data to the instrument and receiving data from the instrument.

When sending data to the instrument, the data block must contain exactly the number of points currently specified in **Sweep, Points** or an error message will be generated and there will be no change to the target trace.

No units terminator (for example, dB or V) is used when sending data; the data is taken as being in the current Y Axis Unit of the instrument.

When a trace is sent to the instrument, it immediately overwrites all of the data in the target trace. Consequently the trace should be inactive in order to achieve predictable results. If you send trace data while a trace is active, and particularly if a sweep or an **Average** or **Max/Min Hold** sequence is already in progress, you may end up with a trace that combines the data you sent with measurement data. Similarly, when querying trace data, it is best if the instrument is not sweeping during the query.

Therefore, it is generally advisable to be in **Single** sweep, or have the trace in **View**, when sending trace data to the instrument or querying trace data from the instrument.

9.3.3.3 Format Data: Numeric Data (Remote Command Only)

Specifies the format of the trace data input and output.

Specifies the formats used for trace data during data transfer across any remote port. Affects only the data format for setting and querying trace data for **:TRACe[:DATA]**, **:TRACe[:DATA]?**, **:CALCuLate:DATA[n]?** and **:FETCh:SANalyzer[n]?**.

Remote Command	<code>:FORMat[:TRACe][:DATA] ASCii INTeger,32 REAL,32 REAL,64</code> <code>:FORMat[:TRACe][:DATA]?</code>
Notes	<p>The query response is:</p> <p><code>ASCii</code>: ASC,8 <code>REAL,32</code>: REAL,32 <code>REAL,64</code>: REAL,64 <code>INTeger,32</code>: INT,32</p> <p>When the numeric data format is REAL or ASCii, data is output in the current Y Axis unit. When the data format is INTeger, data is output in units of m dBm (.001 dBm)</p> <p>The <code>INT,32</code> format returns binary 32-bit integer values in internal units (m dBm), in a definite length block</p>
Dependencies	<p>Sending a data format spec with an invalid number (for example, <code>INT,48</code>) generates no error. The instrument simply uses the default (8 for <code>ASCii</code>, 32 for <code>INTeger</code>, 32 for <code>REAL</code>)</p> <p>Sending data to the instrument which does not conform to the current <code>FORMat</code> specified, results in an error. Sending ASCII data when a definite block is expected generates message -161 "Invalid Block Data" and sending a definite block when ASCII data is expected generates message -121 "Invalid Character in Number"</p>
Preset	<code>ASCii</code>
Backwards Compatibility Notes	Note that the <code>INT,32</code> format is only applicable to <code>:TRACe:DATA</code> . This preserves backwards compatibility for the Swept SA measurement. For all other commands/queries that honor <code>:FORMat:DATA</code> , if <code>INT,32</code> is sent the instrument will behave as though it were set to <code>REAL,32</code>

The specifications for each output type are:

<code>ASCii</code>	Amplitude values are in ASCII, in the current Y Axis Unit, one ASCII character per digit, values separated by commas, each value in the form: <code>SX.YYYYYEsZZ</code> , where: S = sign (+ or -) X = one digit to left of decimal point Y = 5 digits to right of decimal point E = E, exponent header s = sign of exponent (+ or -) ZZ = two digit exponent
<code>REAL,32</code>	Binary 32-bit real values in the current Y Axis Unit, in a definite length block
<code>REAL,64</code>	Binary 64-bit real values in the current Y Axis Unit, in a definite length block

9.3.3.4 Format Data: Byte Order (Remote Command Only)

Selects the binary data byte order for data transfer and other queries.

Controls whether binary data is transferred in normal or swapped mode. Affects only the byte order for setting and querying trace data for `:TRACe[:DATA]`, `:TRACe[:DATA]?`, `:CALCulate:DATA[n]?` and `:FETCh:SANalyzer[n]?`.

By definition, any command that depends on this setting uses *any* format supported by **:FORMat:DATA**.

- **NORMa1** order is a byte sequence that begins with the most significant byte (MSB) first, and ends with the least significant byte (LSB) last in the sequence: 1|2|3|4
- **SWAPped** order is when the byte sequence begins with the LSB first, and ends with the MSB last in the sequence: 4|3|2|1

Remote Command	:FORMat:BORDER NORMa1 SWAPped :FORMat:BORDER?
Preset	NORMa1

9.3.3.5 Calculate/Compress Trace Data Query (Remote Command Only)

Returns compressed data for the currently selected measurement and sub-opcode **[n]**.

n = any valid sub-opcode for that measurement. See the **:MEASure:<measurement>?** query description of your specific measurement for information on the data that can be returned.

The data is returned in the current Y Axis Unit of the instrument. The command is used with a sub-opcode **<n>** (default = 1) to specify the trace. With trace queries, it is best if the instrument is not sweeping during the query. Therefore, it is generally advisable to be in **Single** sweep, or Update = Off.

This command is used to compress or decimate a long trace to extract and return only the desired data. A typical example would be to acquire N frames of GSM data and return the mean power of the first burst in each frame. The command can also be used to identify the best curve fit for the data.

Remote Command	:CALCulate:DATA<n>:COMPRESS? BLOCK CFIT MAXimum MINimum MEAN DMEan RMS SAMPLE SDEVIation PPHase [,<soffset>[,<length> [,<roffset>[,<rlimit>]]]]
----------------	--

Notes Supports 5 parameters, but the last 4 (**<soffset>**, **<length>**, **<roffset>**, **<rlimit>**) are optional. The optional parameters must be entered in the specified order. For example, if you want to specify **<length>**, then you must also specify **<soffset>**. See details below for a definition of each of these parameters

This command uses the data in the format specified by "**Format Data: Byte Order (Remote Command Only)**" on [page 3421](#), returning either binary or ASCII data

As an example, to query the mean power of a set of GSM bursts:

- Supply a signal that is a set of GSM bursts
- Select the IQ Waveform measurement (in IQ Analyzer Mode)
- Set the sweep time to acquire at least one burst

-
- Set the triggers such that acquisition happens at a known position relative to a burst
 - Query the mean burst levels using, `:CALC:DATA2:COMP? MEAN, 24e-6, 526e-6` (These parameter values correspond to GSM signals, where 526e-6 is the length of the burst in the slot and you just want 1 burst)

BLOCK or block data

Returns all the data points from the region of the trace data that you specify. For example, it could be used to return the data points of an input signal over several timeslots, excluding the portions of the trace data that you do not want. (This is x,y pairs for trace data and I,Q pairs for complex data.)

CFIT or curve fit

Applies curve fitting routines to the data. `<soffset>` and `<length>` are required to define the data that you want. `<roffset>` is an optional parameter for the desired order of the curve equation. The query will return the following values: the x-offset (in seconds) and the curve coefficients ((order + 1) values).

`MIN`, `MAX`, `MEAN`, `DME`, `RMS`, `SAMP`, `SDEV` and `PPH` return one data value for each specified region (or `<length>`) of trace data, for as many regions as possible until you run out of trace data (using `<roffset>` to specify regions), or they return the number of regions you specify (using `<rlimit>`) ignoring any data beyond that.

MINimum

Returns the minimum data point (y value) for the specified region(s) of trace data. For I/Q trace data, the minimum magnitude of the I/Q pairs is returned.

MAXimum

Returns the maximum data point (y value) for the specified region(s) of trace data. For I/Q trace data, the maximum magnitude of the I/Q pairs is returned.

MEAN

Returns a single value that is the arithmetic mean of the data point values (in dB/ dBm) for the specified region(s) of trace data. For I/Q trace data, the mean of the magnitudes of the I/Q pairs is returned. See the following equations.

NOTE

If the original trace data is in dB, this function returns the arithmetic mean of those log values, not log of the mean power which is a more useful value. The mean of the log is the better measurement technique when measuring CW signals in the presence of noise. The mean of the power, expressed in dB, is useful in power measurements such as Channel Power. To achieve the mean of the power, use the RMS option.

Equation 1: Mean Value of Data Points for Specified Region(s)

$$\text{MEAN} = \frac{1}{n} \sum_{X_i \in \text{region}(s)} X_i$$

where X_i is a data point value, and n is the number of data points in the specified region(s).

Equation 2: Mean Value of I/Q Data Pairs for Specified Region(s)

$$\text{MEAN} = \frac{1}{n} \sum_{X_i \in \text{region}(s)} |X_i|$$

where $|X_i|$ is the magnitude of an I/Q pair, and n is the number of I/Q pairs in the specified region(s).

DMEan

Returns a single value that is the mean power (in dB/ dBm) of the data point values for the specified region(s) of trace data. See the following equation:

Equation 3: DMEan Value of Data Points for Specified Region(s)

$$\text{DME} = 10 \times \log_{10} \left(\frac{1}{n} \sum_{X_i \in \text{region}(s)} 10^{\frac{X_i}{10}} \right)$$

RMS

Returns a single value that is the average power on a root-mean-squared voltage scale (arithmetic rms) of the data point values for the specified region(s) of trace data. See the following equation.

Equation 4: RMS Value of Data Points for Specified Region(s)

$$\text{RMS} = \sqrt{\frac{1}{n} \sum_{X_i \in \text{region}(s)} X_i^2}$$

where X_i is a data point value, and n is the number of data points in the specified region(s).

For I/Q trace data, the rms of the magnitudes of the I/Q pairs is returned. See the following equation.

NOTE

This function is very useful for I/Q trace data. However, if the original trace data is in dB, this function returns the rms of the log values which is not usually needed.

Equation 5: RMS Value of I/Q Data Pairs for Specified Region(s)

$$\text{RMS} = \sqrt{\frac{1}{n} \sum_{X_i \in \text{region}(s)} X_i X_i^*}$$

where X_i is the complex value representation of an I/Q pair, X_i^* its conjugate complex number, and n is the number of I/Q pairs in the specified region(s).

Once you have the rms value for a region of trace data (linear or I/Q), you may want to calculate the mean power. You must convert this rms value (peak volts) to power in dBm:

$$10 \times \log[10 * (\text{rms value})^2]$$

SAMPLE

Returns the first data value (x,y pair) for the specified region(s) of trace data. For I/Q trace data, the first I/Q pair is returned.

SDEViation

Returns a single value that is the arithmetic standard deviation for the data point values for the specified region(s) of trace data. See the following equation.

Equation 6: Standard Deviation of Data Point Values for Specified Region(s)

$$\text{SDEV} = \sqrt{\frac{1}{n} \sum_{X_i \in \text{region}(s)} (X_i - \bar{X})^2}$$

where X_i is a data point value, \bar{X} is the arithmetic mean of the data point values for the specified region(s), and n is the number of data points in the specified region(s).

For I/Q trace data, the standard deviation of the magnitudes of the I/Q pairs is returned. See the following equation.

Equation 7: Standard Deviation of I/Q Data Pair Values for Specified Region(s)

$$\text{SDEV} = \sqrt{\frac{1}{n} \sum_{X_i \in \text{region}(s)} (|X_i| - \bar{X})^2}$$

where $|X_i|$ is the magnitude of an I/Q pair, \bar{X} is the mean of the magnitudes for the specified region(s), and n is the number of data points in the specified region(s).

PPHase

Returns the x,y pairs of both rms power (dBm) and arithmetic mean phase (radian) for every specified region and frequency offset (Hz). The number of pairs is defined by the specified number of regions. This parameter can be used for I/Q vector ($n=0$) in Waveform (time domain) measurement and all parameters are specified by data point in [PPHase](#).

The rms power of the specified region may be expressed as:

$$\text{Power} = 10 \times \log [10 \times (\text{RMS I/Q value})] + 10.$$

The RMS I/Q value (peak volts) is:

$$\sqrt{\frac{1}{n} \sum_{X_i \in \text{region}} X_i X_i^*}$$

where X_i is the complex value representation of an I/Q pair, X_i^* its conjugate complex number, and n is the number of I/Q pairs in the specified region.

The arithmetic mean phase of the specified region may be expressed as:

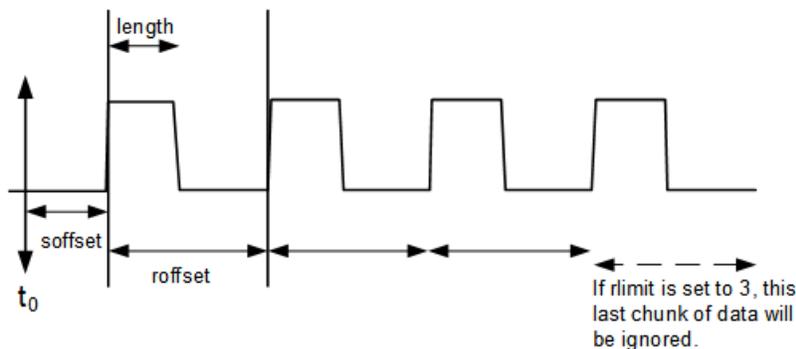

$$\frac{1}{n} \sum_{Y_i \in \text{region}} Y_i$$

where Y_i is the unwrapped phase of I/Q pair with applying frequency correction and n is the number of I/Q pairs in the specified region.

The frequency correction is made by the frequency offset calculated by the arithmetic mean of every specified region's frequency offset. Each frequency offset is calculated by the least square method against the unwrapped phase of I/Q pair.

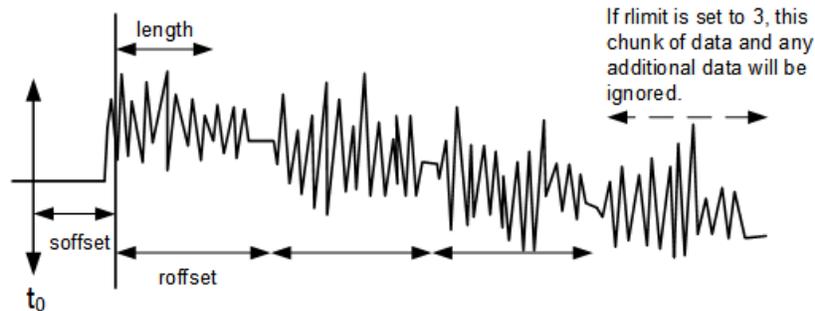

Sample Trace Data - Constant Envelope

(See below for explanation of variables.)

Sample Trace Data - Not Constant Envelope

(See below for explanation of variables.)

- <soffset>** Optional real number, in seconds for time-domain traces, and is a dimensionless index 0 to $N_{\text{points}} - 1$, for frequency-domain traces
Specifies the amount of data at the beginning of the trace that will be ignored before the decimation process starts. It is the time or frequency change from the start of the trace to the point where you want to start using the data. The default value is zero
- <length>** Optional real number, in seconds for time-domain traces, and is a dimensionless index 0 to $N_{\text{points}} - 1$, for frequency-domain traces
Defines how much data will be compressed into one value. This parameter has a default value equal to the current trace length
- <roffset>** Optional real number, in seconds for time-domain traces, and is a dimensionless index 0 to $N_{\text{points}} - 1$, for frequency-domain traces
Defines the beginning of the next field of trace elements to be compressed. This is relative to the beginning of the previous field. This parameter has a default value equal to the **<length>** variable. Note that this parameter is used for a completely different purpose when curve fitting (see ["CFIT or curve fit"](#) on page 3423 above)
- <rlimit>** Optional integer
Specifies the number of data items that you want returned. Ignores any additional items beyond that number. You can use the Start offset and the Repeat limit to pick out exactly what part of the data you want to use. The default value is all the data

9.3.3.6 Calculate Peaks of Trace Data (Remote Command Only)

Returns a list of all the peaks for the currently selected measurement and sub-opcode **[n]**. The peaks must meet the requirements of the peak threshold and excursion values.

n = any valid sub-opcode for the current measurement. See the **:MEASure: <measurement>** command description of your specific measurement for information on the data that can be returned.

The command can only be used with specific sub-opcodes with measurement results that are trace data. Both real and complex traces can be searched, but complex traces are converted to magnitude in dBm. In many measurements the

sub-opcode **n** = 0, is the raw trace data, which cannot be searched for peaks, and sub-opcode **n** = 1, is often calculated results values which also cannot be searched for peaks.

This command uses the data setting specified by "Format Data: Byte Order (Remote Command Only)" on page 3421 and "Format Data: Numeric Data (Remote Command Only)" on page 3420, and can return real or ASCII data. If the format is set to **INT, 32**, it returns **REAL, 32** data.

The command has four types of parameters:

1. Threshold (in dBm)
2. Excursion (in dB)
3. Sorting order (amplitude, frequency, time)
4. Optional in some measurements: Display line use (all, > display line, < display line)

Remote Command	<p>For Swept SA measurement:</p> <pre>:CALCulate:DATA[1] 2 ... 6:PEAKs? <threshold>,<excursion>[,<AMPLitude FREQuency TIME[,ALL GTDLine LTDLine]]</pre> <p>For most other measurements:</p> <pre>:CALCulate:DATA[1] 2 ... 6:PEAKs? <threshold>,<excursion>[,<AMPLitude FREQuency TIME]</pre>
----------------	--

Notes	<p>Parameters:</p> <table border="1"> <tr> <td style="vertical-align: top;"><n></td> <td>The trace that will be used: [1] 2 ... 6</td> </tr> <tr> <td style="vertical-align: top;"><threshold></td> <td> The level below which trace data peaks are ignored Note that the threshold value is required and is always used as a peak criterion. To effectively disable the threshold criterion for this command, provide a substantially low threshold value such as -200 dBm Note also that the threshold value used in this command is independent of and has no effect on the threshold value stored under the Peak Criteria menu </td> </tr> <tr> <td style="vertical-align: top;"><excursion></td> <td> The minimum amplitude variation (rise and fall) required for a signal to be identified as peak Note that the excursion value is required and is always used as a peak criterion. To effectively disable the excursion criterion for this command, provide the minimum value of 0.0 dB Note also that the excursion value used in this command is independent of and has no effect on the excursion value stored under the Peak Criteria menu </td> </tr> </table>	<n>	The trace that will be used: [1] 2 ... 6	<threshold>	The level below which trace data peaks are ignored Note that the threshold value is required and is always used as a peak criterion. To effectively disable the threshold criterion for this command, provide a substantially low threshold value such as -200 dBm Note also that the threshold value used in this command is independent of and has no effect on the threshold value stored under the Peak Criteria menu	<excursion>	The minimum amplitude variation (rise and fall) required for a signal to be identified as peak Note that the excursion value is required and is always used as a peak criterion. To effectively disable the excursion criterion for this command, provide the minimum value of 0.0 dB Note also that the excursion value used in this command is independent of and has no effect on the excursion value stored under the Peak Criteria menu
<n>	The trace that will be used: [1] 2 ... 6						
<threshold>	The level below which trace data peaks are ignored Note that the threshold value is required and is always used as a peak criterion. To effectively disable the threshold criterion for this command, provide a substantially low threshold value such as -200 dBm Note also that the threshold value used in this command is independent of and has no effect on the threshold value stored under the Peak Criteria menu						
<excursion>	The minimum amplitude variation (rise and fall) required for a signal to be identified as peak Note that the excursion value is required and is always used as a peak criterion. To effectively disable the excursion criterion for this command, provide the minimum value of 0.0 dB Note also that the excursion value used in this command is independent of and has no effect on the excursion value stored under the Peak Criteria menu						

Values must be provided for threshold and excursion. The sorting and display line parameters are optional (defaults are **AMPLitude** and **ALL**)

Note that there is always a Y-axis value for the display line, regardless of whether the display line state is on or off. It is the current Y-axis value of the display line which is used by this command to determine whether a peak should be reported

Sorting order:

AMPLitude	Lists the peaks in order of descending amplitude, with the highest peak first If this optional parameter not sent, this is the default
FREQuency	Lists the peaks in order of occurrence, left to right across the x-axis
TIME	Lists the peaks in order of occurrence, left to right across the x-axis

Peaks vs. Display Line:

ALL	Lists all of the peaks found (default if optional parameter not sent)
GTDLIne	Lists all of the peaks found above the display line

Greater than display line

LTDLine	Lists all of the peaks found below the display line
----------------	---

Less than display line

For example, for Swept SA measurement in Spectrum Analyzer Mode:

:CALC:DATA4:PEAK? -40,10,FREQ,GTDL

Identifies the peaks of trace 4 that are above -40 dBm, with excursions of at least 10 dB. The peaks are returned in order of increasing frequency, starting with the lowest frequency. Only the peaks that are above the display line are returned

Query Results:

If **:FORMat:DATA REAL,32** is selected, returns a list of floating-point numbers. The first value in the list is the number of peak points that are in the following list. A peak point consists of two values: a peak amplitude followed by its corresponding frequency (or time)

If no peaks are found, the peak list consists of only the number of peaks, (0)

9.3.3.7 Smooth Trace Data (Remote Command Only)

Included for ESA compatibility. Not recommended for new designs. Use

:CALCulate:DATA:COMPRESS instead.

Smooths the trace according to the number of points specified in

:TRACe:MATH:SMOoth:POINts. There is no equivalent front panel function.

The purpose of this function is to perform a spatial video averaging, as compared to the temporal version supplied by the video-average command

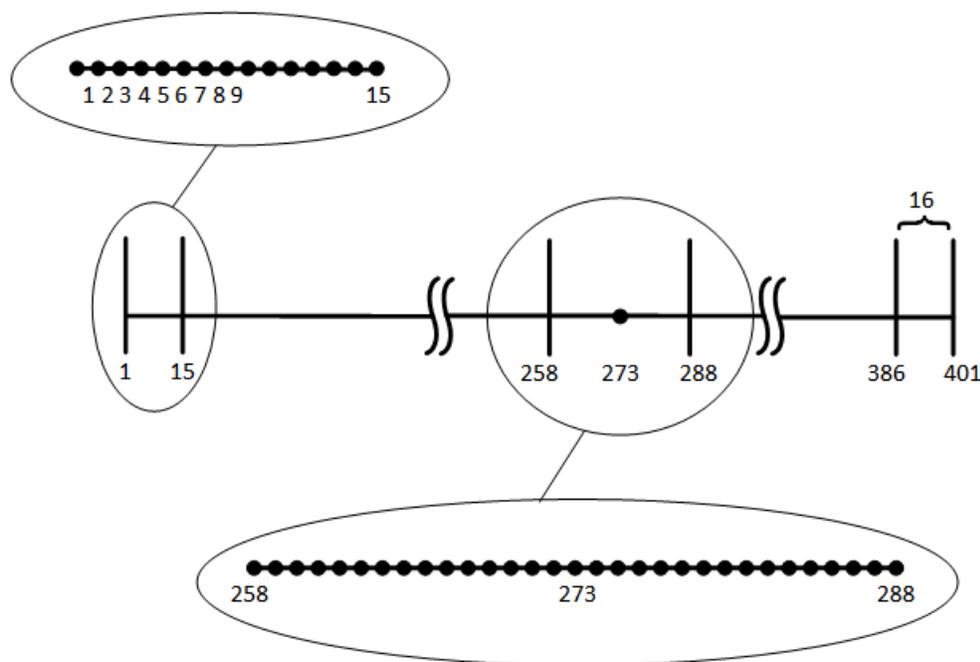

[:SENSe]:AVERAge:TYPE VIDEo. The functions of **:TRACe:MATH:SMOoth <trace>** and **[:SENSe]:AVERAge:TYPE VIDEo|POWER** are not interchangeable.

Backwards Compatibility **:TRACe:MATH:SMOoth TRACE1 | ... | TRACE6**
SCPI

Each point value is replaced with the average of the values of the selected number of points, with half of those points located on each side of any particular point (when possible). Refer to the illustration below, which shows a 401 point trace with a smoothing number of 31. Think of the trace points as “buckets” of data. To smooth (arbitrary) point 273, the instrument averages buckets 258 through 288 and applies that value to point 273.

Increasing the number of points increases smoothing at the cost of decreasing resolution.

The amount of smoothing decreases at the end points. Because `:TRACe:MATH:SMOoth <trace>` averages values that occur before and after the data point in time, display irregularities can be caused at the start and stop frequencies. To avoid possible irregularities (signal distortion) at the ends of the trace, use small values for the smooth parameter.

Smoothing With 401 Trace Points and 31 Smoothing Points

Refer to the illustration above for a discussion of this end-point smoothing phenomena. With 31 smoothing points and a 401 point trace, point 16 will be the first point to have full 31-bucket smoothing. Likewise, point 386 will be the last point with full 31-bucket smoothing. Under the conditions stated, points 2 through 15 will be smoothed as follows: Point 2 is derived from averaging buckets 1 through 3. Point 3 is derived from averaging buckets 1 through 5, Point 4 is derived from averaging buckets 1 through 7, and so forth until point 16 is reached. The quantity of buckets used for the smoothing running average increases at the rate of 2 buckets per point, from point 1 to point $(\lfloor \text{smoothing number} + 1 \rfloor / 2)$, at which time the full number of smoothing points is utilized. The same characteristic occurs at the

completion of the trace, beginning at point 386, beyond which the number of averaging buckets begins to decrease until point 401 is reached.

By replacing the value of each point in a trace with the average of the values of a number of points centered about that point, any rapid variations in noise or signals are smoothed into more gradual variations. It thereby performs a function similar to reducing the video bandwidth without the corresponding changes in sweep time; as such, frequency resolution is decreased. Also, signal peaks are reduced with large smoothing values. This can cause the amplitude to appear to be less than its actual value.

9.3.3.8 Number of Points for Smoothing (Remote Command Only)

Included for ESA compatibility. Not recommended for new designs. Use `:CALCulate:DATA:COMPRESS` instead.

Specifies the number of points that will be smoothed. Increasing the number of points increases smoothing at the cost of decreasing resolution. If the number of points is an even number, then the number of points is increased by one. If the number of points is larger than the number of sweep points, then the number of sweep points is used, unless the number of sweep points is even, in which case the number of points will be the sweep points minus one. The number of points smoothed is always an odd number.

Example	<code>:TRAC:MATH:SMO:POIN 501</code>
Notes	Only odd values are allowed If an even value of <code><integer></code> is specified, adds 1 unless <code><integer></code> = number of sweep points, in which case subtract 1 Used with <code>TRACe:MATH:SMOoth</code>
Preset	11
Min	3
Max	Number of sweep points
Backwards Compatibility SCPI	<code>:TRACe:MATH:SMOoth:POINts <integer></code> <code>:TRACe:MATH:SMOoth:POINts?</code>

9.3.3.9 Mean Trace Data (Remote Command Only)

Included for ESA compatibility. Not recommended for new designs. Use `:CALCulate:DATA:COMPRESS` instead.

Returns the mean of the amplitudes of the trace amplitude elements in measurement units.

9 Programming the Instrument
9.3 SCPI Operation and Results Query

Example	<code>:TRAC:MATH:MEAN? TRACE2</code>
Backwards Compatibility SCPI	<code>:TRACe:MATH:MEAN? TRACE1 ... TRACE6</code>

9.4 Status Register System & STATus Subsystem

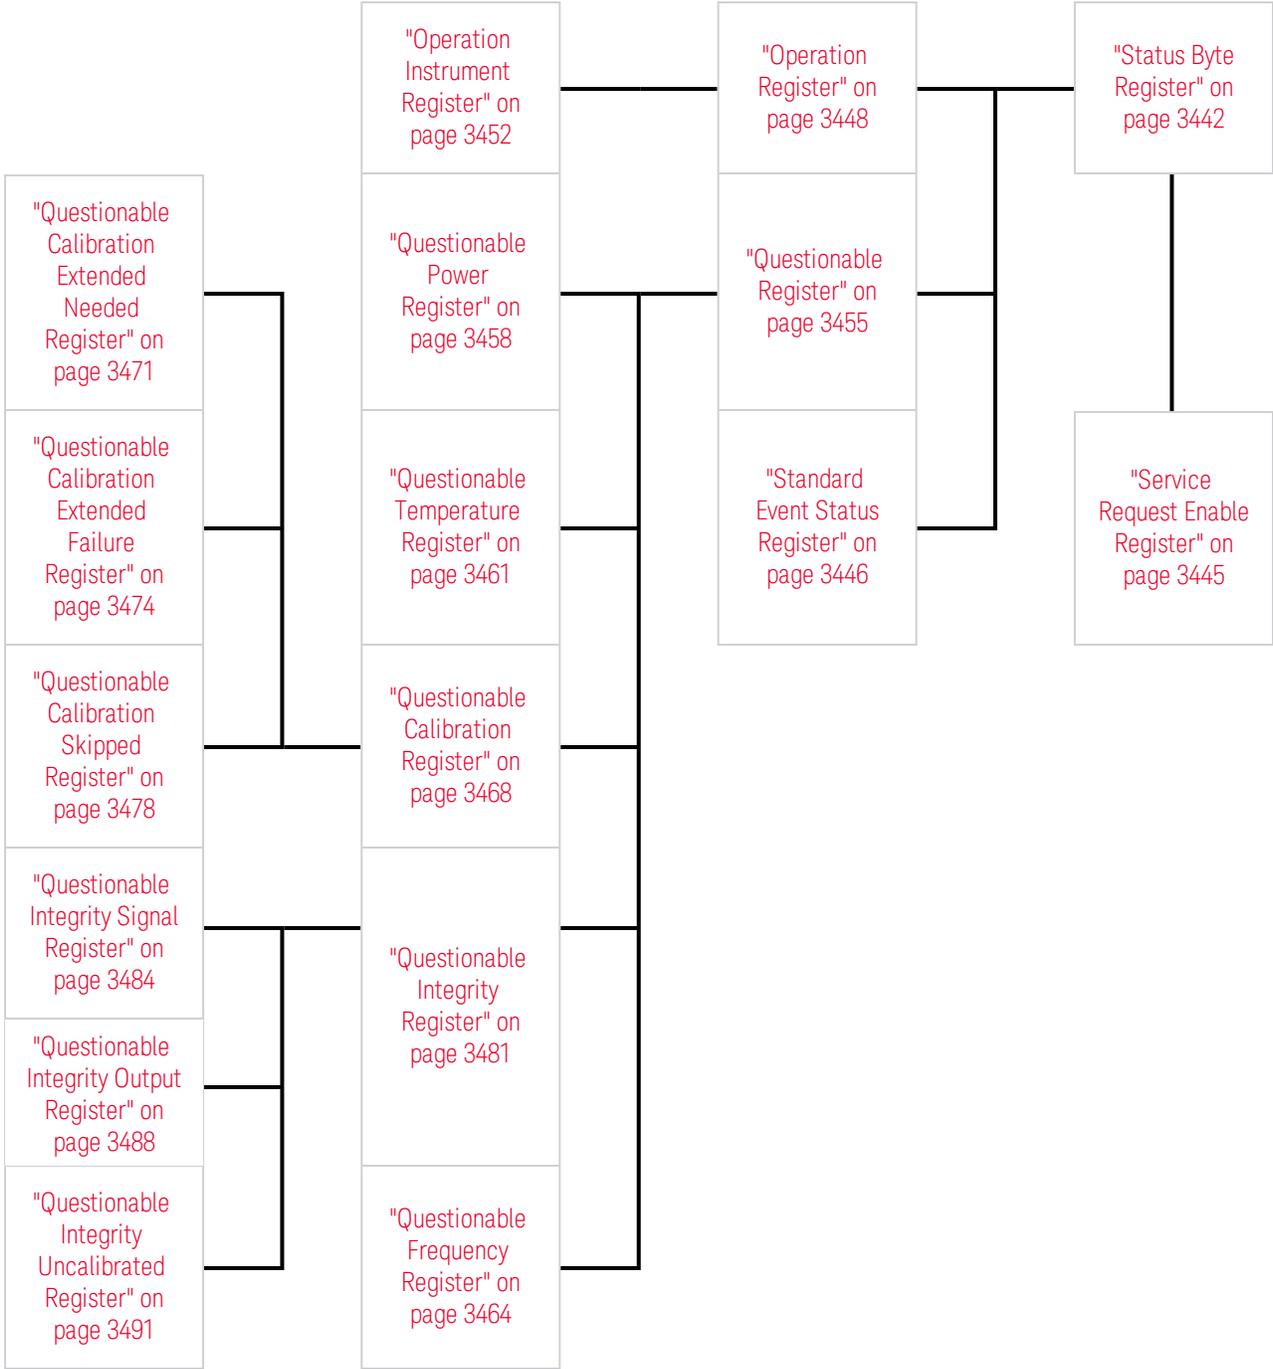

This section provides an overview of the X-Series SCPI status register system, and how to manage the registers. For detailed programming information on each status register, see ["Status Subsystem Registers and Commands" on page 3442](#).

The SCPI **STATus** Subsystem allows you to monitor a number of status conditions within the instrument through the use of a hierarchy of status registers containing bits which go true or false depending on various conditions.

9.4.1 Status Register System Diagram

The diagram below provides a top-level overview of all the Status Registers and their interconnections.

To navigate to detailed information about each Register, click on a register name:

Detailed System Diagram

As from the X-Apps 2023 update, the fully-detailed system diagram that previously appeared here is still available, but, for improved readability, it is now published as

a separate high-resolution PDF. You can download the document from Keysight's web site at:

<http://literature.cdn.keysight.com/litweb/pdf/N9040-90056.pdf>

9.4.2 Status Register Hierarchy

The Status Register system contains multiple registers, arranged in a hierarchy. The lower-level registers propagate their data to the higher-level registers in the data structures by means of summary bits.

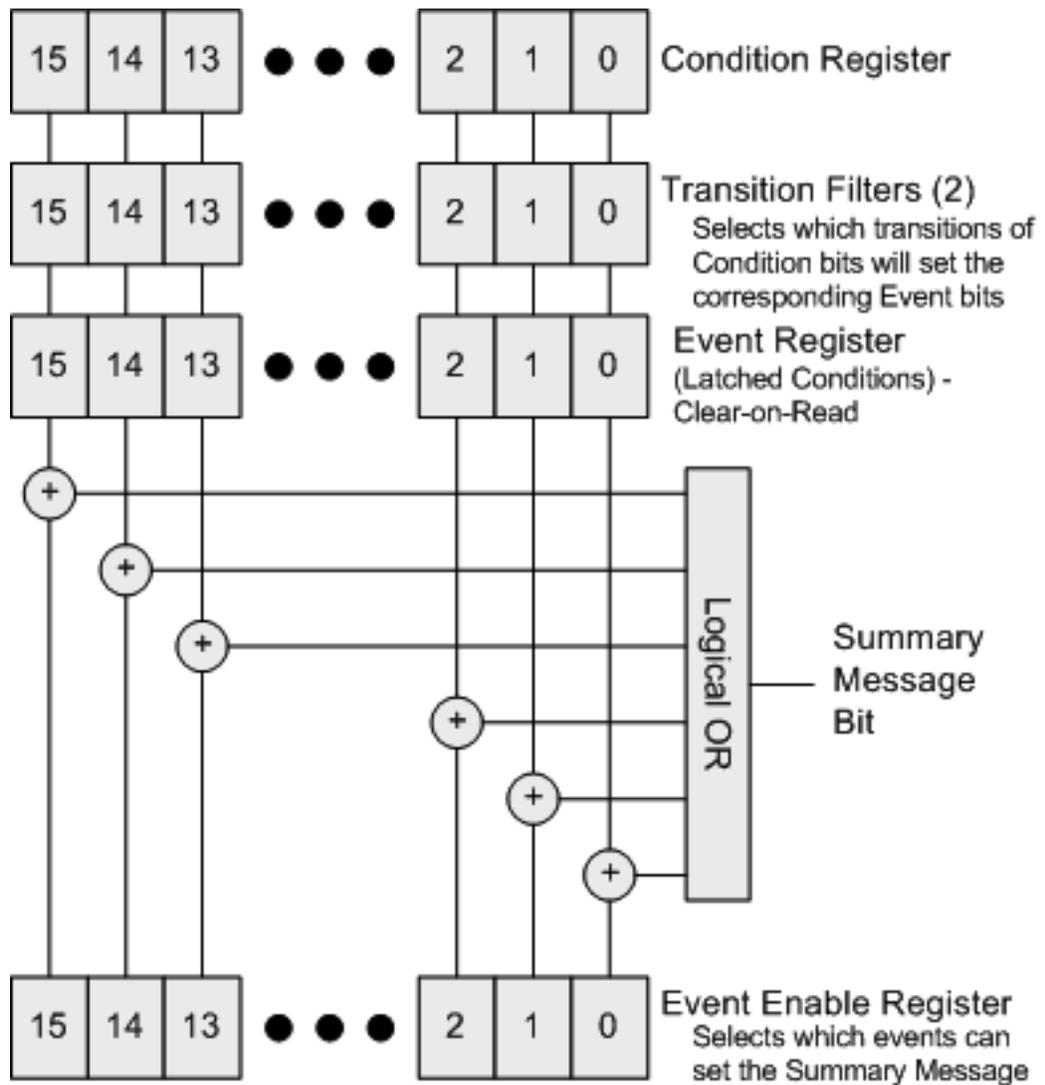

The "Status Byte Register" on page 3442 is at the top of the hierarchy and contains general status information for the instrument's events and conditions. All other individual registers are used to determine the specific events or conditions.

The "Operation Register" on page 3448 and "Questionable Register" on page 3455 are sets of registers that monitor the overall instrument condition. They are accessed using `:STATus:OPERation` and `:STATus:QUEStionable` commands in the `STATus` subsystem. Each composite status register set consists of five sub-registers:

1	Condition Register	Reports the real-time state of the signals monitored by this register set. There is no latching or buffering for a condition register
2	Positive Transition Register	Transition Filter Register Controls which signals will set a bit in the event register when the signal makes a low to high transition (when the condition bit changes from 0 to 1)
3	Negative Transition Register	Transition Filter Register Controls which signals will set a bit in the event register when the signal makes a high to low transition (when the condition bit changes from 1 to 0)
4	Event Register	Latches any signal state changes, in the way specified by the filter registers. Bits in the event register are never cleared by signal state changes. Event registers are cleared when read. They are also cleared by <code>*CLS</code> and by presetting the instrument
5	Event Enable Register	Controls which of the bits, being set in the event register, will be summarized as a single output for the register set. Summary bits are then used by the next higher register

Each status register produces a summary message bit.

The diagram below shows how the sub-registers relate to each other.

The settings of the Transition Filter registers determine whether or not a bit set in a Condition register ripples through to the Event register, as follows:

- If a bit is set in the Positive Transition register, then the corresponding bit in the Event register is set when the condition bit goes from low to high (false to true, off to on)
- Conversely, if a bit is set in the Negative Transition register then the Event register bit is set when the condition bit goes from high to low
- If *both* Transition Filter registers are set true, then the event bit for that condition is set whenever there is any change in the bit. If an event bit is set, the Event Enable register determines whether or not it will **OR** into the summary bit that is sent to the next level of register. If this bit is set, then the corresponding event bit will be included

Note that the Event register is "Clear-on-Read": when any bit is read, it is automatically cleared.

Questionable Registers

These registers report abnormal operating conditions. The status register hierarchy is:

- The summary outputs from the six **QUESTionable: <keyword>** detail registers are inputs to the **"Questionable Register" on page 3455**
- The summary output from the **"Questionable Register" on page 3455** is an input to the Status Byte Register
- The summary output from the is an input to the **"Operation Register" on page 3448**. The inputs to the **"Operation Condition Query" on page 3450** Register indicate the real time state of the instrument. The **"Operation Event Query" on page 3450** Register summary output is an input to the Status Byte Register

Note that, in E4406A only, the **"Operation Enable" on page 3450** Register has an additional function. It is **ANDed** with the **"Operation Condition Query" on page 3450** Register to determine the instrument busy state, which is checked by **"*OPC? - Operation Complete" on page 3408** and **"*WAI - Wait-to-Continue" on page 3412**. If the **ANDed** result is non-zero, the instrument is considered busy.

9.4.3 Status Register SCPI Commands

Monitoring of instrument conditions is done at the highest level using the following IEEE 488.2 common commands.

For complete command descriptions, see **"IEEE 488.2 Common Commands" on page 3405**. Individual status registers can be set and queried using the commands described in **"Status Subsystem Registers and Commands" on page 3442**.

*CLS	Clear Status	Clears the status byte by emptying the error queue and clearing all the event registers
*ESE	Event Status	Sets and queries the bits in the enable register part of the standard event status register
*ESE?	Enable	
*ESR?	Event Status Register	Queries and clears the event register part of the standard event status register
*OPC	Operation	Sets the standard event status register to monitor the completion of all commands. The query stops any new commands from being processed until the current processing is complete, then returns a '1'
*OPC?	Complete	
*PSC	Power-on	Sets the power-on state so that it clears the service request enable register and the event status enable register at power on
*PSC?	State Clear	
*SRE	Service	Sets and queries the value of the service request enable register

*SRE?	Request Enable	
*STB?	Status Byte	Queries the value of the status byte register without erasing its contents

9.4.4 How to Use Status Registers

A program often needs to be able to detect and manage error conditions or changes in instrument status.

There are two methods you can use to programmatically access the information in status registers:

- The "[Polling Method](#)" on page 3438
- The "[Service Request \(SRQ\) Method](#)" on page 3439

The Polling Method works well if you do not need to know about changes the moment they occur. To detect a change using this method, the program must repeatedly read the registers.

The SRQ Method should be used if you must know immediately when a condition changes.

Either method allows you to monitor one or more conditions.

9.4.4.1 Polling Method

In this method, the instrument has a passive role. It only tells the controller that conditions have changed when the controller asks the right question.

Use this method when:

- your programming language/development environment does not support SRQ interrupts
- you want to write a simple, single-purpose program and don't want the added complexity of setting up an SRQ handler

To monitor a condition:

- Determine which register contains the bit that reports the condition
- Send the unique SCPI query to read that register
- Examine the bit to see if the condition has changed

Monitoring Options

You can monitor conditions in various ways:

- 1 Check the current instrument hardware and firmware status
Do this by querying the condition registers, which continuously monitor status. These registers represent the current state of the instrument. Bits in a condition register are updated in real time
When the condition monitored by a particular bit becomes true, the bit is set to 1. When the condition becomes false, the bit is reset to 0
- 2 Monitor a particular condition (bit)
You can enable a particular bit(s), using the ["Standard Event Status Enable Register" on page 3447](#). The instrument will then monitor that particular condition. If the bit becomes true (0 to 1 transition) in the Event Register, it will stay set until the Event Register is cleared. Querying the Event Register allows you to detect that this condition occurred, even if the condition no longer exists. The Event Register can only be cleared by querying it, or by sending `*CLS`
- 3 Monitor a particular type of change in a condition (bit)
By default, the Transition Registers are set if the condition goes from 0 to 1 (false to true, or a positive transition), but you can change this behavior so the selected condition is detected if the bit goes from 1 to 0 (true to false, or a negative transition)
You can also detect *both* types of transitions, or neither
If both Transition Registers are set to 0 for a particular bit position, that bit is *not* set in the ["Standard Event Status Enable Register" on page 3447](#) for either type of change

9.4.4.2 Service Request (SRQ) Method

In this method, the instrument takes a more active role, by informing the controller when there has been a condition change, without the controller asking.

Use this method when:

- you need time-critical notification of changes
- you are monitoring more than one device which supports SRQs
- you need to have the controller do something else while waiting
- you can't afford the performance penalty inherent to polling

Using the Service Request (SRQ) Method

Your language, bus, and programming environment must be able to support SRQ interrupts, for example, BASIC used with VXI-11.3 (GPIB over LAN). When you

monitor a condition with the SRQ method, you must:

- Determine which bit monitors the condition
- Determine how that bit reports to the request service (**RQS**) bit of the status byte
- Send SCPI commands to enable the bit that monitors the condition and to enable the summary bits that report the condition to the **RQS** bit
- Enable the controller to respond to service requests

When the condition changes, the instrument sets its **RQS** bit. The controller is informed of the change as soon as it occurs. As a result, the time the controller would otherwise have used to monitor the condition can be used to perform other tasks. Your program determines how the controller responds to the SRQ.

Bit 6 of the "Status Byte Register" on page 3442 is the request service (**RQS**) bit. Use ***SRE** to configure the **RQS** bit to report changes in instrument status. When such a change occurs, the **RQS** bit is set. It is cleared when the Status Byte Register is queried using ***SRE?** (with a serial poll.) It can be queried *without* erasing the contents by using ***STB?**.

When a register being set causes a summary bit in the status byte to change from 0 to 1, the instrument can initiate the service request (SRQ) process. However, the process is only initiated if *both* the following conditions are true:

The corresponding bit of the service request enable register is also set to 1

The instrument does not have a service request pending. (A service request is considered to be pending between the time the instrument's SRQ process is initiated and the time the controller reads the status byte register)

The SRQ process sets the SRQ true. It also sets the status byte's request service (**RQS**) bit to 1. Both actions are necessary to inform the controller that the instrument requires service. Setting the SRQ line *only* informs the controller that some device on the bus requires service. Setting the **RQS** bit allows the controller to determine which instrument requires service.

If your program enables the controller to detect and respond to service requests, it should instruct the controller to perform a serial poll when the SRQ is set true. Each device on the bus returns the contents of its Status Byte Register in response to this poll. The device whose **RQS** bit is set to 1 is the device that requested service.

NOTE

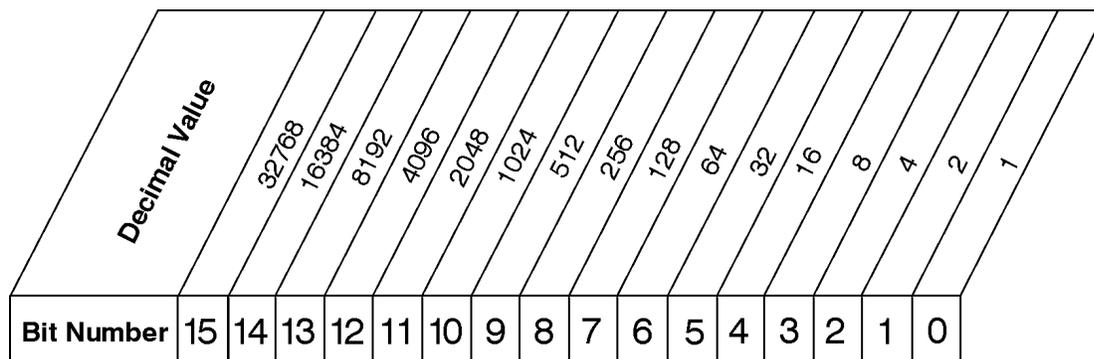

When you read the instrument's Status Byte Register using a serial poll, the **RQS bit is reset to 0. Other bits in the register are not affected.**

If the status register is configured to SRQ on end-of-measurement, and the measurement is in **Continuous** mode, then restarting a measurement (via **:INIT**) can cause the measuring bit to pulse low. This causes an SRQ even though you have not actually reached the "end-of-measurement" condition. To avoid this:

- Set `:INITiate:CONTinuous OFF`
- Set/enable the status registers
- Restart the measurement (send `:INIT`)

9.4.5 Status Register Bit Parameters

The diagram below shows a typical status register, in this case the "Operation Enable" on page 3450 Register. Each bit in a register is represented by a numerical value based on its location. When a command requires a bit pattern to be sent as its parameter, that can be entered as a numeric value using decimal or hexadecimal representations. (where 0 to 32767 is equivalent to `#H0` to `#H7FFF`). If you want to enable more than one bit, you send the sum of all the bits that you want to monitor.

`STATus:OPERation:ENABLE <num>`
`STATus:OPERation:ENABLE?`

Standard Operation Event Enable Register

ck730a

NOTE Bit 15 is not used to report status.

Example 1

To enable bit 0 and bit 6 of standard event status register, you would send the command `*ESE 65` because $1 + 64 = 65$

The results of a query are evaluated in a similar way. If the `*STB?` command returns a decimal value of 140, ($140 = 128 + 8 + 4$) then bit 7 is true, bit 3 is true and bit 2 is true

Example 2

Suppose you want to know if an Auto-trigger Timeout occurs, but you only cared about that specific condition. So you would want to know what was happening with bit 10 in the Status Questionable Integrity register, and not about any other bits

It is usually a good idea to start by clearing all the status registers, using `*CLS`

Sending `:STAT:QUES:INT:ENAB 1024` lets you monitor only bit 10 events, instead of the default monitoring all the bits in the register. The register default is for positive transition events (0 to 1 transition), that is, when an auto-trigger timeout occurs. If instead, you want to know when the Auto-trigger timeout condition is cleared, then you set `:STAT:QUES:INT:PTR 0` and `:STAT:QUES:INT:NTR 32767`

Now, the only output from the "Questionable Integrity Register" on page 3481 will come from a bit 10 positive transition, and goes to the Integrity Sum bit 9 of the "Questionable Register" on page 3455

If you want only to monitor bit 9 of the same register, send `:STAT:QUES:ENAB 512`

The "Questionable Register" on page 3455 output goes to the "Status Questionable Summary" bit 3 of the "Status Byte Register" on page 3442. The output from this register can be enabled using `*SRE 8`.

Finally, you can use the serial polling functionality available for the particular bus/software that you are using to monitor the Status Byte Register, or you could use `*STB?` to poll the Status Byte Register.

9.4.6 Status Subsystem Registers and Commands

The Status Subsystem registers monitor various events and conditions in the instrument. Software written to control the instrument may need to monitor some of these events and conditions.

To set and query status registers, you can use the `STATus` subsystem SCPI commands and queries.

NOTE

All status register commands are sequential. You can send them in the middle of an ongoing overlapped command to get the current status. You can also send them following a sequential command. In this case, the status register command waits for the completion of the previously-sent sequential command before performing the action.

Most commands are sequential commands; only a few are overlapped.

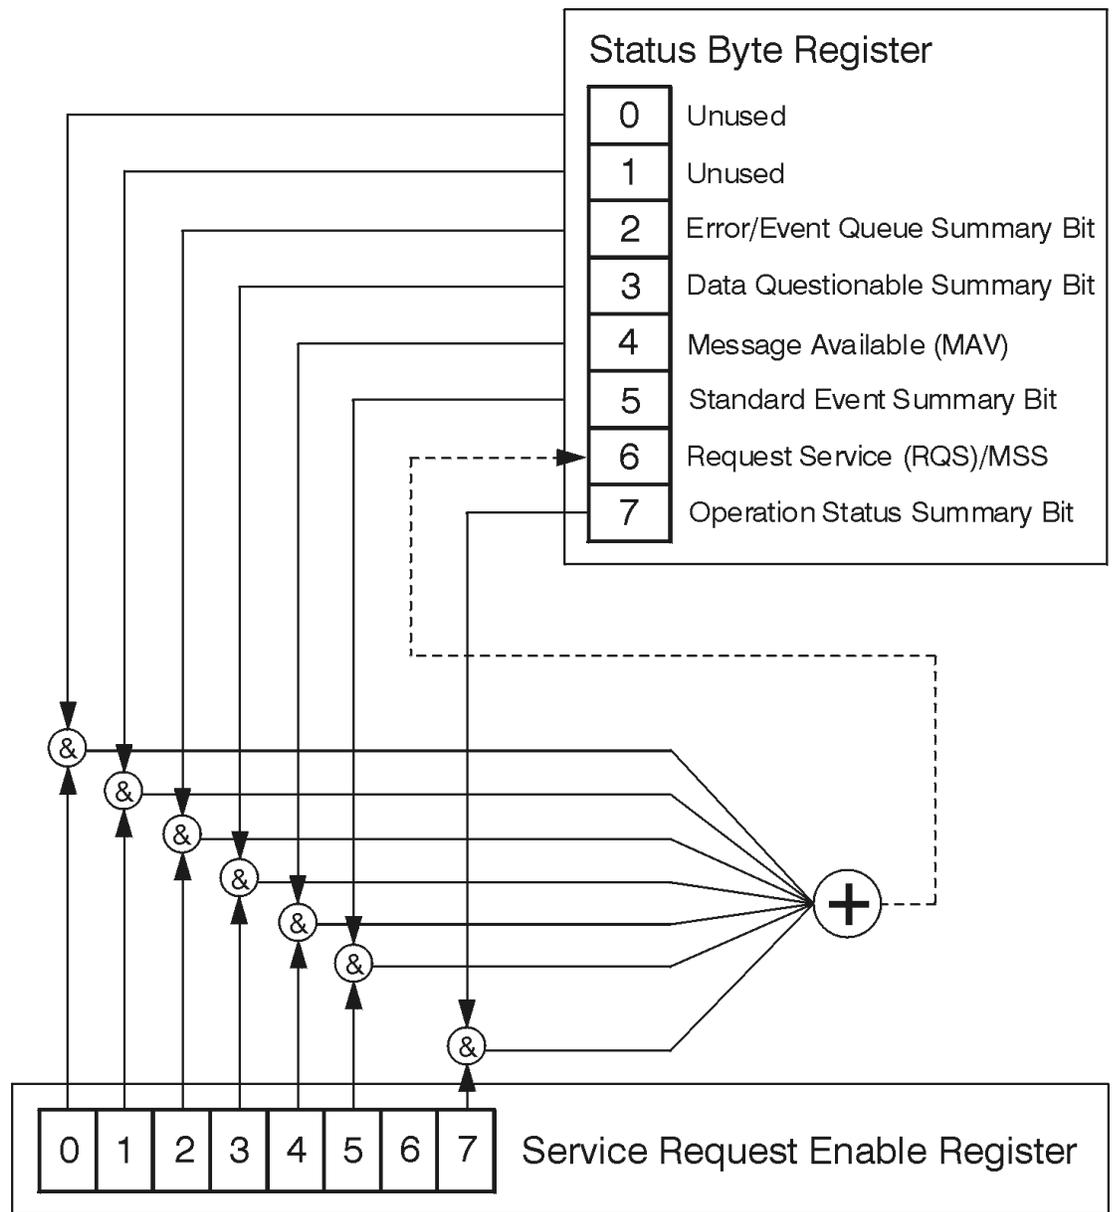

If a command *is* overlapped, then that is explicitly stated in the command description.

See also the [Keysight X-Series Signal Analyzers Instrument Messages](#) manual for more detail on the instrument conditions that can cause these bits to be set.

9.4.6.1 Status Byte Register

Provides a one-byte overview of the entire `STATus` subsystem. All the other registers funnel into this register via summary bits, as shown in the "Status Register

System Diagram" on page 3433.

ck776a

Bit Number	7	6	5	4	3	2	1	0
Description	Standard Operation Status Summary Bit	Request Service (RQS) Summary Bit	Standard Event Status Summary Bit	Message Available (MAV)	Data Questionable Status Summary Bit	Error/Event Queue Summary Bit	Unused	Unused

*STB?

Status Byte Register

ck725a

Bit	Description
0, 1	These bits are always set to 0
2	A 1 in this bit position indicates that the SCPI error queue is not empty which means that it contains at least one error message
3	A 1 in this bit position indicates that the data questionable summary bit has been set. The data questionable event register can then be read to determine the specific condition that caused this bit to be set
4	A 1 in this bit position indicates that the instrument has data ready in the output queue. There are no lower status groups that provide input to this bit
5	A 1 in this bit position indicates that the standard event summary bit has been set. The standard event status register can then be read to determine the specific event that caused this bit to be set
6	A 1 in this bit position indicates that the instrument has at least one reason to report a status change. This bit is also called the master summary status bit (MSS)
7	A 1 in this bit position indicates that the standard operation summary bit has been set. The standard operation event register can then be read to determine the specific condition that caused this bit to be set

To query the Status Byte Register, send "***STB? - Status Byte Query**" on page 3411. The response will be the decimal sum of the bits that are set to 1. For example, if bit number 7 and bit number 3 are set to 1, the decimal sum of the 2 bits is 128 plus 8, so the decimal value 136 is returned.

***STB** does *not* clear the status register.

The **RQS** bit is read and reset by a serial poll. The same bit position (**MSS**) is read non-destructively by ***STB?**. If you serial-poll bit 6, it is read as **RQS**, but if you send ***STB**, it reads bit 6 as **MSS**. For more information refer to Section 11 of: [IEEE Standard 488.2-1992](#)

In addition to the Status Byte Register, the status byte group also contains the "Service Request Enable Register" on page 3445, which lets you select which bits in the Status Byte Register will trigger a service request.

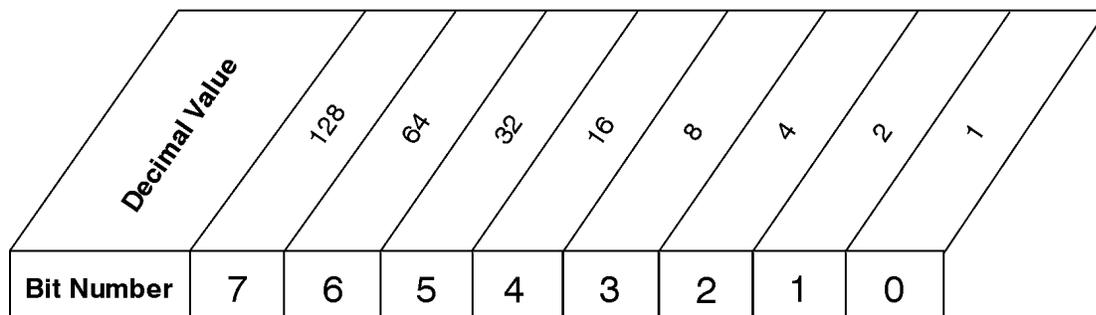

Service Request Enable Register

Enables the desired bits of the Service Request (SRQ) subsystem.

Send `*SRE <integer>`, where `<integer>` is the sum of the decimal values of the bits you want to enable plus the decimal value of bit 6. For example, assume that you want to enable bit 7 so that whenever the standard operation status register summary bit is set to 1 it will trigger a service request. Send the command `*SRE 192` (because $192 = 128 + 64$). You must always add 64 (the numeric value of RQS bit 6) to your numeric sum when you enable any bits for a service request.

`*SRE?` returns the decimal value of the sum of the bits previously enabled with `*SRE <integer>`.

This register presets to zeros (0).

`*SRE <num>`
`*SRE?`

Service Request Enable Register

ck726a

See also "[*SRE - Service Request Enable](#)" on page 3410

Preset the Status Byte

Sets bits in most of the enable and transition registers to their default state.

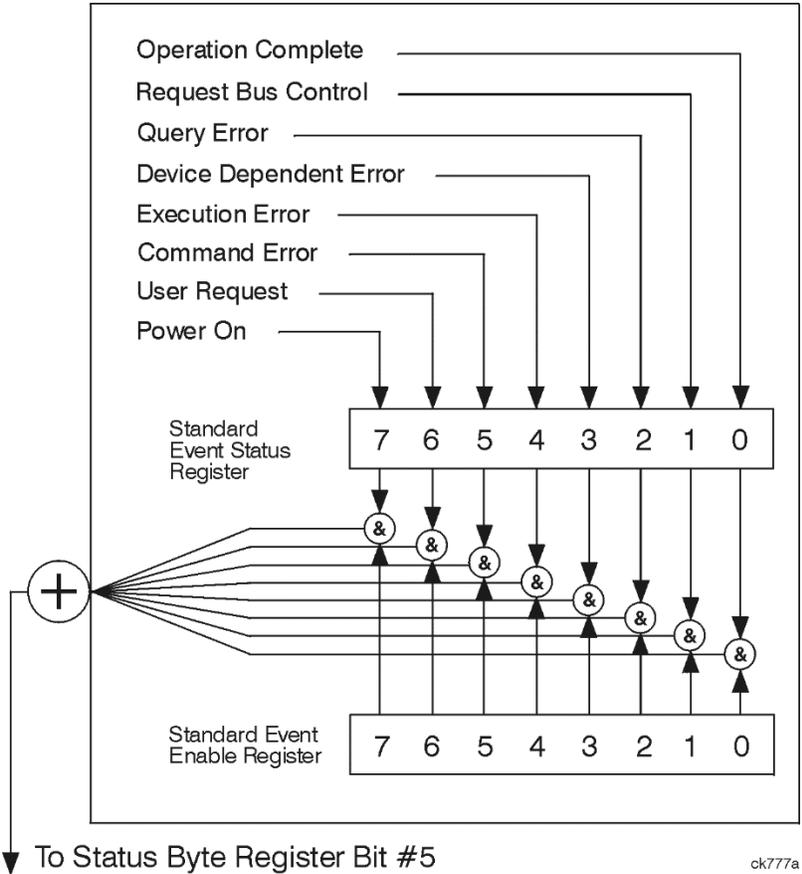

- Presets:
- All Transition Filters
- All Enable Registers
- Error/Event Queue Enable

Has no effect on Event Registers, Error/Event QUEue, IEEE 488.2 ESE, and SRE Registers, as described in: [IEEE Standard 488.2-1992](#)

Remote Command :STATus:PRESet

Example :STAT:PRES

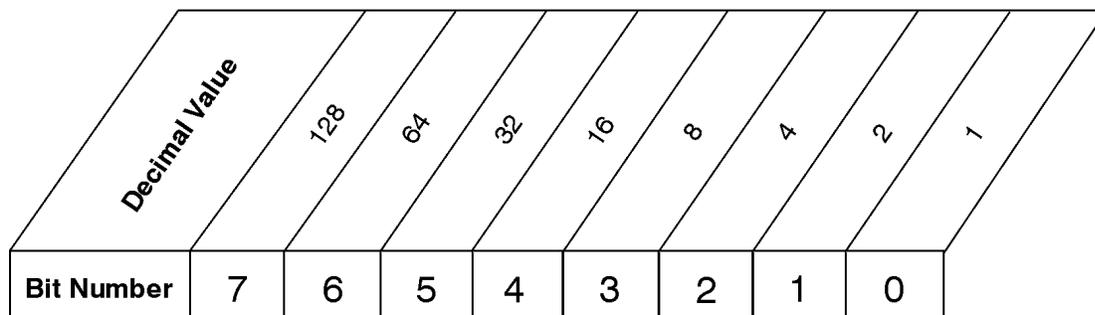

9.4.6.2 Standard Event Status Register

The standard event status register contains the following bits:

register lets you choose which bits in the standard event status register will set the summary bit (bit 5 of the status byte register) to 1. Send `*ESE <integer>`, where `<integer>` is the sum of the decimal values of the bits you want to enable. For example, to enable bit 7 and bit 6 so that whenever either of those bits is set to 1, the standard event status summary bit of the status byte register will be set to 1, send `*ESE 192` (128 + 64). `*ESE?` returns the decimal value of the sum of the bits previously enabled with `*ESE <integer>`.

The standard event status enable register presets to zeros (0).

`*ESE <num>`
`*ESE?`

Standard Event Status Enable Register

ck728a

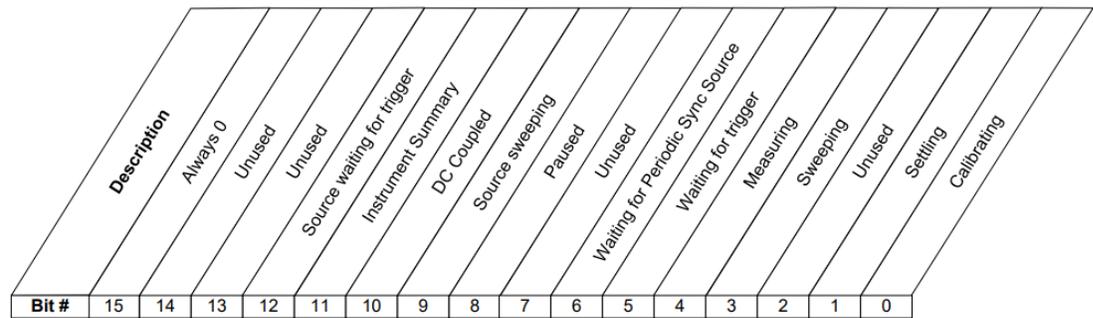

See also ["*ESE - Standard Event Status Enable" on page 3406](#)

9.4.6.3 Operation Register

SCPI Name: `STATus:OPERation`

This register and the ["Questionable Register" on page 3455](#) are sets of registers that monitor the overall instrument condition. They are accessed using `:STATus:OPERation` and `:STATus:QUESTionable`.

This register monitors the current instrument measurement state and various instrument operations for a quick summary of what is happening within the instrument. It checks to see if the instrument is calibrating, sweeping, or waiting for a trigger (see also ["*OPC? - Operation Complete" on page 3408](#)).

STATus:OPERation Register

Bit	Condition	Operation
0	Calibrating	The instrument is busy executing its Align Now process
1	Settling	The instrument circuitry is settling
3	Sweeping	The instrument is busy taking a sweep
4	Measuring	The instrument is busy making a measurement. Measurements often require multiple sweeps. They are initiated by user-interface keys or with the MEASure group of commands The bit is valid for most X-Series Modes
5	Waiting for trigger	The instrument is waiting for the trigger conditions to be met, then it will trigger a sweep or measurement
6	Waiting for Periodic Sync Source	The instrument is waiting for the Periodic trigger Sync Source conditions to be met, then the sweep or measurement period will be synchronized
8	Paused	The measurement is paused
9	Source Sweeping	The List Sequencer is running or Freq Scan results are available
10	DC Coupled	The instrument is DC coupled
11	Instrument Summary	The summary bit for the "Operation Instrument Register" on page 3452
12	Source Waiting for Trigger	The built in source is waiting for a trigger

Filter Registers

- ["Operation Condition Query" on page 3450](#)
- ["Operation Enable" on page 3450](#)
- ["Operation Event Query" on page 3450](#)
- ["Operation Negative Transition" on page 3451](#)
- ["Operation Positive Transition" on page 3451](#)

Operation Condition Query

Returns the decimal value of the sum of the bits in the "Operation Condition Query" on page 3450 register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	:STATus:OPERation:CONDition?
Example	:STAT:OPER:COND?
Preset	0
Status Bits/OPC dependencies	Sequential command

Operation Enable

Determines which bits in the "Operation Event Query" on page 3450 register will set the Operation Status Summary bit (bit 7) in the "Status Byte Register" on page 3442.

The variable <integer> is the sum of the decimal values of the bits you want to enable.

NOTE The preset condition is to have all bits in this enable register set to 0. To have any Operation Events reported to the Status Byte Register, one or more bits need to be set to 1.

Remote Command	:STATus:OPERation:ENABLE <integer> :STATus:OPERation:ENABLE?
Example	:STAT:OPER:ENAB 1 Sets the register so that Align Now events will be reported to the Status Byte Register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Operation Event Query

Returns the decimal value of the sum of the bits in the Operation Event register.

NOTE

The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	<code>:STATus:OPERation[:EVENT]?</code>
Example	<code>:STAT:OPER?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Operation Negative Transition

Determines which bits in the "Operation Condition Query" on page 3450 register will set the corresponding bit in the "Operation Event Query" on page 3450 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:OPERation:NTRansition <integer></code> <code>:STATus:OPERation:NTRansition?</code>
Example	<code>:STAT:OPER:NTR 1</code> Align Now operation complete will be reported to the Status Byte Register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Operation Positive Transition

Determines which bits in the "Operation Condition Query" on page 3450 register will set the corresponding bit in the "Operation Event Query" on page 3450 register when the condition register bit has a positive transition (0 to 1).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

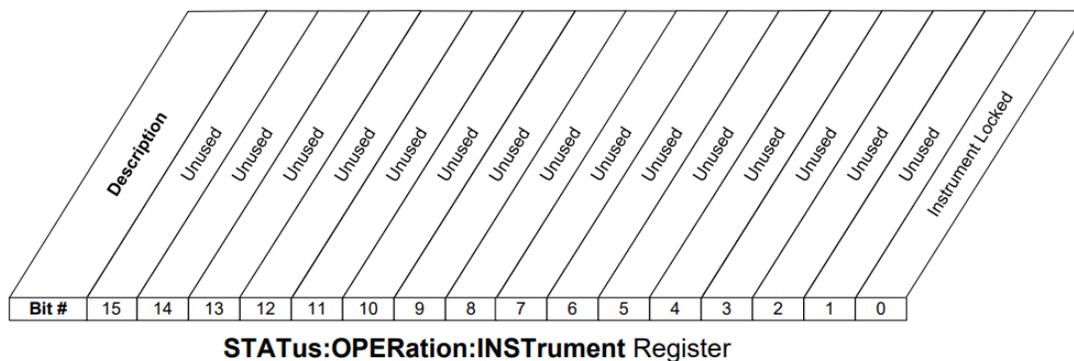

Remote Command	<code>:STATus:OPERation:PTRansition <integer></code> <code>:STATus:OPERation:PTRansition?</code>
Example	<code>:STAT:OPER:PTR 1</code>

	Align Now operation beginning will be reported to the Status Byte Register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.4 Operation Instrument Register

SCPI Name: **STATus:OPERation:INSTrument**

Monitors instrument-related operations and summarizes them in bit 11 of the "Operation Register" on page 3448.

Bit	Condition	Operation
0	Instrument Locked	The instrument is locked

Filter Registers

- "Operation Instrument Condition" on page 3452
- "Operation Instrument Enable" on page 3453
- "Operation Instrument Event Query" on page 3453
- "Operation Instrument Negative Transition" on page 3454
- "Operation Instrument Positive Transition" on page 3454

Operation Instrument Condition

Returns the decimal value of the sum of the bits in the Status Operation Instrument Condition register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	:STATus:OPERation:INSTrument:CONDition?
Example	:STAT:OPER:INST:COND?
Preset	0
Status Bits/OPC dependencies	Sequential command

Operation Instrument Enable

Determines which bits in the "Operation Instrument Condition" on page 3452 Register will set bits in the "Operation Instrument Event Query" on page 3453 register, which also sets the Instrument Summary bit (bit 11) in the "Operation Instrument Register" on page 3452.

The variable <integer> is the sum of the decimal values of the bits you want to enable.

NOTE The preset condition is to have all bits in this enable register set to 0. To have any Instrument Events reported to the Status Byte Register, one or more bits need to be set to 1.

Remote Command	:STATus:OPERation:INSTrument:ENABle <integer> :STATus:OPERation:INSTrument:ENABle?
Example	:STAT:OPER:INST:ENAB 1 Sets the register so that Instrument Locked will be reported to the Status Byte Register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Operation Instrument Event Query

Returns the decimal value of the sum of the bits in the Operation Instrument Event register.

NOTE The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this

register is latched until it is queried. Once queried, the register is cleared.

Remote Command	<code>:STATus:OPERation:INSTrument[:EVENT]?</code>
Example	<code>:STAT:OPER:INST?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Operation Instrument Negative Transition

Determines which bits in the "Operation Condition Query" on page 3450 Register will set the corresponding bit in the "Operation Event Query" on page 3450 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:OPERation:INSTrument:NTRansition <integer></code> <code>:STATus:OPERation:INSTrument:NTRansition?</code>
Example	<code>:STAT:OPER:INST:NTR 1</code> Instrument Locked being cleared will be reported to the Instrument Summary of the Status Operation register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Operation Instrument Positive Transition

Determines which bits in the "Operation Condition Query" on page 3450 Register will set the corresponding bit in the "Operation Event Query" on page 3450 register when the condition register bit has a positive transition (0 to 1).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:OPERation:INSTrument:PTRansition <integer></code> <code>:STATus:OPERation:INSTrument:PTRansition?</code>
Example	<code>:STAT:OPER:INST:PTR 1</code> Instrument Locked being set will be reported to the Instrument Summary of the Status Operation

	register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.5 Questionable Register

SCPI Name: **STATus:QUESTionable**

This register and the "Operation Register" on page 3448 monitor the overall instrument condition. They are accessed using **:STATus:OPERation** and **:STATus:QUESTionable**.

This register monitors the instrument's condition to see if anything questionable has happened. It detects anything that might cause an error or a bad measurement, such as a hardware problem, an out-of-calibration situation, or a unusual signal. All the bits are summary bits from lower-level event registers.

Bit	Condition	Operation
3	Power summary	Summary bit for "Questionable Power Register" on page 3458
4	Temperature summary	Summary bit for "Questionable Temperature Register" on page 3461
5	Frequency summary	Summary bit for "Questionable Frequency Register" on page 3464
8	Calibration summary	Summary bit for "Questionable Calibration Register" on page 3468
9	Integrity summary	Summary bit for "Questionable Integrity Register" on page 3481

Filter Registers

- "Questionable Condition" on page 3456
- "Questionable Enable" on page 3456
- "Questionable Event Query" on page 3457
- "Questionable Negative Transition" on page 3457
- "Questionable Positive Transition" on page 3458

Questionable Condition

Returns the decimal value of the sum of the bits in the Questionable Condition register.

NOTE The data in this register is continuously updated and reflects current conditions.

Remote Command	<code>:STATus:QUEStionable:CONDition?</code>
Example	<code>:STAT:QUES:COND?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Enable

Determines which bits in the "Questionable Event Query" on page 3457 Register will set the Questionable Status Summary bit (bit3) in the "Status Byte Register" on page 3442.

The variable `<integer>` is the sum of the decimal values of the bits you want to enable.

NOTE The preset condition is all bits in this enable register set to 0. To report any Questionable Events to the Status Byte Register, one or more bits need to be set to 1. The "Standard Event Status Register" on page 3446 should be queried after each measurement to check the Questionable Status Summary (bit 3). If it is equal to 1, a condition during the test may have made the test results invalid. If it is equal to 0, this indicates that no hardware problem or measurement problem was detected by the analyzer.

Remote Command	<code>:STATus:QUEStionable:ENABle <integer></code> <code>:STATus:QUEStionable:ENABle?</code>
----------------	---

	<code>:STATus:OPERation:ENABle <integer></code>
	<code>:STATus:OPERation:ENABle?</code>
Example	<code>:STAT:QUES:ENAB 16</code> Sets the register so that questionable temperature events will be reported to the Status Byte Register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Event Query

Returns the decimal value of the sum of the bits in the Questionable Event register.

NOTE

The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	<code>:STATus:QUEStionable[:EVENT]?</code>
Example	<code>:STAT:QUES?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Negative Transition

Determines which bits in the "Questionable Condition" on page 3456 Register will set the corresponding bit in the "Questionable Event Query" on page 3457 Register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUEStionable:NTRansition <integer></code> <code>:STATus:QUEStionable:NTRansition?</code>
Example	<code>:STAT:QUES:NTR 16</code> Temperature summary 'questionable cleared' will be reported to the Status Byte Register
Preset	0
Min	0

Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Positive Transition

Determines which bits in the "Questionable Condition" on page 3456 Register will set the corresponding bit in the "Questionable Event Query" on page 3457 Register when the condition register bit has a positive transition (0 to 1).

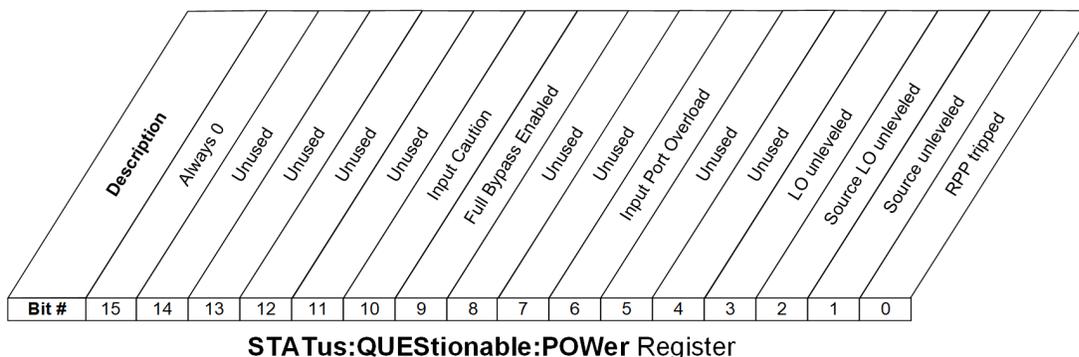

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:PTRansition <integer></code> <code>:STATus:QUESTionable:PTRansition?</code>
Example	<code>:STAT:QUES:PTR 16</code> Temperature summary 'questionable asserted' will be reported to the Status Byte Register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.6 Questionable Power Register

SCPI Name: `STATus:QUESTionable:POWer`

Monitors power-related conditions within the instrument and summarizes them in bit 3 of the "Questionable Register" on page 3455.

Bit	Condition	Operation
0	RPP tripped	(not currently in use)
1	Source Unleveled	The built-in source is not properly leveled
2	Source LO Unleveled	(not currently in use)
3	LO Unleveled	(not currently in use)
6	Input Port Overload	A power overload condition exists at an input port
9	Full Bypass Enabled	Frontend circuitry is bypassed, use caution to protect the mixer
10	Input Caution	Input circuitry is configured such that care is required to prevent damage

Filter Registers

Questionable Power Condition

Returns the decimal value of the sum of the bits in the Questionable Power Condition register.

NOTE

The data in this register is continuously updated and reflects the current conditions.

Remote Command	<code>:STATus:QUESTionable:POWer:CONDition?</code>
Example	<code>:STAT:QUES:POW:COND?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Power Enable

Determines which bits in the ["Questionable Power Condition" on page 3459](#) Register will set bits in the Questionable Power Event register, which also sets the Power Summary bit (bit 3) in the ["Questionable Register" on page 3455](#).

The variable `<integer>` is the sum of the decimal values of the bits you want to enable.

Remote Command	<code>:STATus:QUESTionable:POWer:ENABle <integer></code> <code>:STATus:QUESTionable:POWer:ENABle?</code>
Example	<code>:STAT:QUES:POW:ENAB 2</code> Source Unlevelled will be reported to the Power Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Power Event Query

Returns the decimal value of the sum of the bits in the Questionable Power Event Query register.

NOTE The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	<code>:STATus:QUESTionable:POWer[:EVENT]?</code>
Example	<code>:STAT:QUES:POW?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Power Negative Transition

Determines which bits in the "Questionable Power Condition" on page 3459 register will set the corresponding bit in the "Questionable Power Event Query" on page 3460 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:POWer:NTRansition <integer></code> <code>:STATus:QUESTionable:POWer:NTRansition?</code>

Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.7 Questionable Temperature Register

SCPI Name: `STATus:QUESTionable:TEMPerature`

Monitors temperature-related conditions within the instrument and summarizes them in bit 4 of the "Questionable Register" on page 3455.

Bit	Condition	Operation
0	Reference Oscillator Oven Cold	(not currently in use)
1	Instrument overheated (over temperature)	Excessive heat has been detected in some part of the instrument
2	Instrument over current	Excessive heat has been detected in some part of the instrument, the instrument should be restarted

Filter Registers

- "Questionable Temperature Condition" on page 3462
- "Questionable Temperature Enable" on page 3463
- "Questionable Temperature Event Query" on page 3463
- "Questionable Temperature Negative Transition" on page 3463
- "Questionable Temperature Positive Transition" on page 3464

Questionable Temperature Condition

Returns the decimal value of the sum of the bits in the Questionable Temperature Condition register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	:STATUS:QUESTIONable:TEMPERature:CONDition?
Example	:STAT:QUES:TEMP:COND?
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Temperature Enable

Determines which bits in the "Questionable Temperature Condition" on page 3462 Register will set bits in the "Questionable Temperature Event Query" on page 3463 register, which also sets the Temperature Summary bit (bit 4) in the "Questionable Register" on page 3455.

The variable `<integer>` is the sum of the decimal values of the bits you want to enable.

Remote Command	<code>:STATus:QUESTionable:TEMPerature:ENABle <integer></code> <code>:STATus:QUESTionable:TEMPerature:ENABle?</code>
Example	<code>:STAT:QUES:TEMP:ENAB 2</code> Instrument Overheated will be reported to the Temperature Summary of the Questionable Register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Temperature Event Query

Returns the decimal value of the sum of the bits in the Questionable Temperature Event register.

NOTE

The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	<code>:STATus:QUESTionable:TEMPerature[:EVENT]?</code>
Example	<code>:STAT:QUES:TEMP?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Temperature Negative Transition

Determines which bits in the "Questionable Temperature Condition" on page 3462 Register will set bits in the "Questionable Temperature Event Query" on page 3463 register, when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:TEMPerature:NTRansition <integer></code> <code>:STATus:QUESTionable:TEMPerature:NTRansition?</code>
Example	<code>:STAT:QUES:TEMP:NTR 2</code> Instrument Overheated being cleared will be reported to the Temperature Summary of the Status Questionable register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Temperature Positive Transition

Determines which bits in the "Questionable Temperature Condition" on page 3462 Register will set bits in the "Questionable Temperature Event Query" on page 3463 register, when the condition register bit has a positive transition (0 to 1).

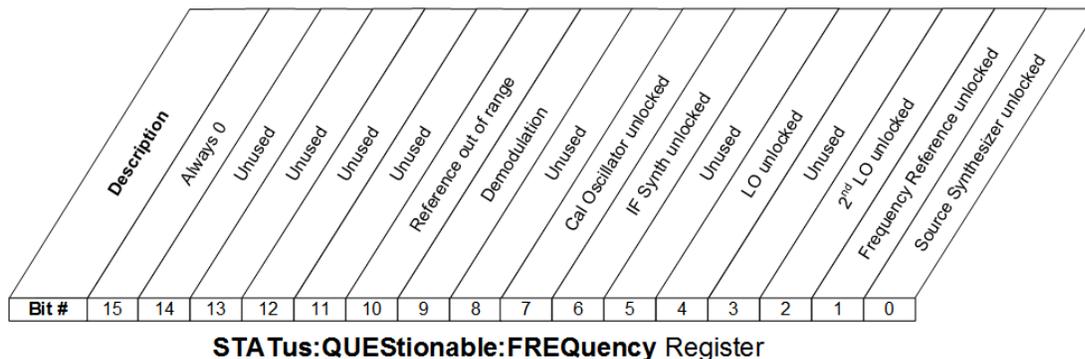

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:TEMPerature:PTRansition <integer></code> <code>:STATus:QUESTionable:TEMPerature:PTRansition?</code>
Example	<code>:STAT:QUES:TEMP:PTR 2</code> Instrument Overheated being set will be reported to the Temperature Summary of the Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.8 Questionable Frequency Register

SCPI Name: `STATus:QUESTionable:FREQuency`

Monitors frequency-related conditions within the instrument and summarizes them in bit 5 of the "Questionable Register" on page 3455.

Bit	Condition	Operation
0	Source Synth Unlocked	The synthesizer in the built-in source is not locked
1	Frequency Reference Unlocked	The instrument's frequency reference is unlocked
2	2 nd LO Unlocked	The instrument's second LO (local oscillator) is unlocked
4	LO Unlocked	The instrument's main LO (local oscillator) is unlocked
6	IF Synth Unlocked	The synthesizer in the IF is not locked
7	Cal Osc Unlocked	The oscillator used for internal calibrations is not locked
9	Demodulation	Demodulation cannot be performed due to an out of range frequency
10	Reference missing or out of range	The signal being fed to a reference input is missing or too high or low in frequency for the reference to lock

Filter Registers

Questionable Frequency Condition

Returns the decimal value of the sum of the bits in the Questionable Frequency Condition register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	<code>:STATus:QUESTionable:FREQuency:CONDition?</code>
Example	<code>:STAT:QUES:FREQ:COND?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Frequency Enable

Determines which bits in the "Questionable Frequency Condition" on page 3465 Register will set bits in the "Questionable Temperature Event Query" on page 3463 register, which also sets the Frequency Summary bit (bit 5) in the "Questionable Register" on page 3455.

The variable `<integer>` is the sum of the decimal values of the bits you want to enable.

Remote Command	<code>:STATus:QUESTionable:FREQuency:ENABle <integer></code> <code>:STATus:QUESTionable:FREQuency:ENABle?</code>
Example	<code>:STAT:QUES:FREQ:ENAB 2</code> Frequency Reference Unlocked will be reported to the Frequency Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Frequency Event Query

Returns the decimal value of the sum of the bits in the Questionable Frequency Event register.

NOTE

The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	<code>:STATus:QUESTionable:FREQuency[:EVENT]?</code>
Example	<code>:STAT:QUES:FREQ?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Frequency Negative Transition

Determines which bits in the "Questionable Frequency Condition" on page 3465 register will set the corresponding bit in the "Questionable Frequency Event Query" on page 3466 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:FREQuency:NTRansition <integer></code> <code>:STATus:QUESTionable:FREQuency:NTRansition?</code>
Example	<code>:STAT:QUES:FREQ:NTR 2</code> Frequency Reference 'regained lock' will be reported to the Frequency Summary of the Status Questionable register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Frequency Positive Transition

Determines which bits in the "Questionable Frequency Condition" on page 3465 register will set the corresponding bit in the "Questionable Frequency Event Query" on page 3466 register when the condition register bit has a positive transition (0 to 1).

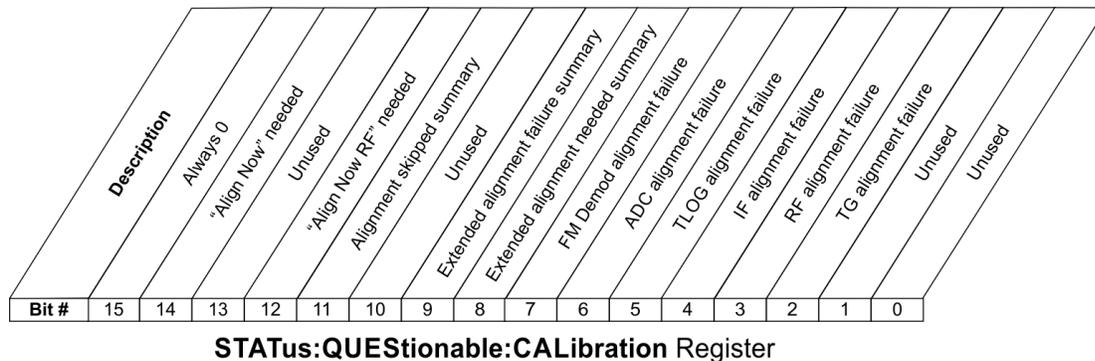

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:FREQuency:PTRansition <integer></code> <code>:STATus:QUESTionable:FREQuency:PTRansition?</code>
Example	<code>:STAT:QUES:FREQ:PTR 2</code> Frequency Reference 'became unlocked' will be reported to the Frequency Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.9 Questionable Calibration Register

SCPI Name: **STATus:QUESTionable:CALibration**

Monitors calibration-related conditions within the instrument and summarizes them in bit 8 of the "Questionable Register" on page 3455. Three of the bits are summary bits from lower-level event registers.

Bit	Condition	Operation
2	TG Alignment Failure	The Tracking Generator failed to align properly
3	RF Alignment Failure	The RF section (frontend) failed to align properly
4	IF Alignment Failure	The IF section failed to align properly
5	LO Alignment Failure	The LO (local oscillator) failed to align properly
6	ADC Alignment Failure	The ADC section failed to align properly
7	FM Demod Alignment Failure	The FM Demod section failed to align properly
8	Extended Align Needed Summary	Summary bit for "Questionable Calibration Extended Needed Register" on page 3471
9	Extended Align Failure Summary	Summary bit for "Questionable Calibration Extended Failure Register" on page 3474
11	Align Skipped Sum Summary	Summary bit for "Questionable Calibration Skipped Register" on page 3478
12	"Align Now RF" required	Go to the System, Alignments, Align Now menu and perform an "Align Now RF"
14	"Align Now" required	Go to the System, Alignments, Align Now menu and perform an "Align Now All" or an "Align Now Expired"

Filter Registers

- "Questionable Calibration Condition" on page 3469
- "Questionable Calibration Enable" on page 3469
- "Questionable Calibration Event Query" on page 3470
- "Questionable Calibration Negative Transition" on page 3470
- "Questionable Calibration Positive Transition" on page 3470

Questionable Calibration Condition

Returns the decimal value of the sum of the bits in the Questionable Calibration Condition register.

NOTE

The data in this register is continuously updated and reflects the current conditions.

Remote Command	<code>:STATus:QUESTionable:CALibration:CONDition?</code>
Example	<code>:STAT:QUES:CAL:COND?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Enable

Determines which bits in the "Questionable Calibration Condition" on page 3469 Register will set bits in the "Questionable Calibration Event Query" on page 3470 register, which also sets the Calibration Summary bit (bit 8) in the "Questionable Register" on page 3455.

The variable `<integer>` is the sum of the decimal values of the bits you want to enable.

Remote Command	<code>:STATus:QUESTionable:CALibration:ENABLE <integer></code> <code>:STATus:QUESTionable:CALibration:ENABLE?</code>
Example	<code>:STAT:QUES:CAL:ENAB 16384</code> Can be used to query if an alignment is needed, if you have turned off the automatic alignment process
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Event Query

Returns the decimal value of the sum of the bits in the Questionable Calibration Event register.

NOTE

The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	<code>:STATus:QUEStionable:CALibration[:EVENT]?</code>
Example	<code>:STAT:QUES:CAL?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Negative Transition

Determines which bits in the "Questionable Calibration Condition" on page 3469 register will set the corresponding bit in the "Questionable Calibration Event Query" on page 3470 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUEStionable:CALibration:NTRansition <integer></code> <code>:STATus:QUEStionable:CALibration:NTRansition?</code>
Example	<code>:STAT:QUES:CAL:NTR 16384</code> "Align All Now Needed" being cleared will be reported to the Calibration Summary of the Status Questionable register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Positive Transition

Determines which bits in the "Questionable Calibration Condition" on page 3469 register will set the corresponding bit in the "Questionable Calibration Event Query"

on page 3470 register when the condition register bit has a positive transition (0 to 1).

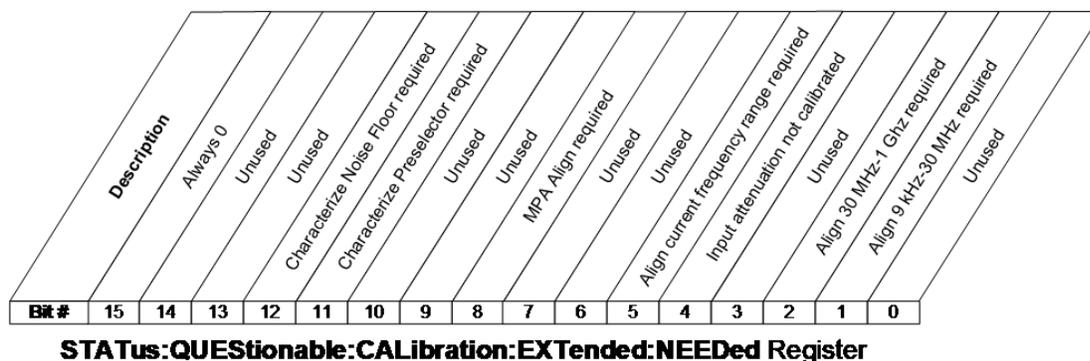

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:CALibration:PTRansition <integer></code> <code>:STATus:QUESTionable:CALibration:PTRansition?</code>
Example	<code>:STAT:QUES:CAL:PTR 16384</code> "Align All Now Needed" being set will be reported to the Calibration Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.10 Questionable Calibration Extended Needed Register

SCPI Name: `STATus:QUESTionable:EXTended:NEEDed`

Monitors conditions that occur because a calibration or alignment is required to guarantee accurate measurements. It summarizes them in bit 8 of the "Questionable Calibration Register" on page 3468.

Bit	Condition	Operation
1	Align 9kHz-30MHz required	EMI receiver alignment required, 9kHz-30 MHz (conducted band)
2	Align 30MHz-1GHz required	EMI receiver alignment required, 30 MHz-1 GHz (radiated band)
4	Input Attenuation not calibrated	The input attenuator is uncalibrated

Bit	Condition	Operation
5	Align current frequency range required	Alignment for current set frequency range is needed. It is suggested to process Align Selected Freq Range for the frequency range in use
8	MPA Align required	The Multiport Adaptor must be calibrated (EXT only)
11	Characterize Preselector required	Go to the System, Alignments, Advanced menu and perform a "Characterize Preselector"
12	Characterize Noise Floor required	Go to the System, Alignments, Advanced menu and perform a "Characterize Noise Floor"

Filter Registers

Questionable Calibration Extended Needed Condition

Returns the decimal value of the sum of the bits in the Questionable Calibration Extended Needed Condition register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	<code>:STATus:QUESTionable:CALibration:EXTended:NEEDed:CONDition?</code>
Example	<code>:STAT:QUES:CAL:EXT:NEED:COND?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Extended Needed Enable

Determines which bits in the ["Questionable Calibration Extended Needed Condition" on page 3472](#) will set bits in the ["Questionable Calibration Extended Needed Event Query" on page 3473](#) register, which also sets bit 14 of the ["Questionable Calibration Register" on page 3468](#).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:CALibration:EXTended:NEEDed:ENABLE <integer></code> <code>:STATus:QUESTionable:CALibration:EXTended:NEEDed:ENABLE?</code>
Example	<code>:STAT:QUES:CAL:EXT:NEED:ENAB 2</code> Can be used to query if an EMI conducted alignment is needed
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Extended Needed Event Query

Returns the decimal value of the sum of the bits in the Questionable Calibration Extended Needed Event register.

NOTE

The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	<code>:STATus:QUESTionable:CALibration:EXTended:NEEDed[:EVENT]?</code>
Example	<code>:STAT:QUES:CAL:EXT:NEED?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Extended Needed Negative Transition

Determines which bits in the "Questionable Calibration Extended Needed Condition" on page 3472 register will set the corresponding bit in the "Questionable Calibration Extended Needed Event Query" on page 3473 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:CALibration:EXTended:NEEDed:NTRansition <integer></code> <code>:STATus:QUESTionable:CALibration:EXTended:NEEDed:NTRansition?</code>
Example	<code>:STAT:QUES:CAL:EXT:NEED:NTR 2</code>

	Conducted alignment required bit being cleared will be reported
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Extended Needed Positive Transition

Determines which bits in the "Questionable Calibration Extended Needed Condition" on page 3472 register will set the corresponding bit in the "Questionable Calibration Extended Needed Event Query" on page 3473 register when the condition register bit has a positive transition (0 to 1).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:CALibration:EXTended:NEEDed:PTRansition <integer></code> <code>:STATus:QUESTionable:CALibration:EXTended:NEEDed:PTRansition?</code>
Example	<code>:STAT:QUES:CAL:EXT:NEED:PTR 2</code> Conducted alignment required bit being set will be reported
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.11 Questionable Calibration Extended Failure Register

SCPI Name: `STATus:QUESTionable:EXTended:FAILure`

Monitors conditions that occur because a calibration or alignment has failed to complete properly. It summarizes them in bit 9 of the "Questionable Calibration Register" on page 3468.

Bit #	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Description	Always 0	Misc/System Alignment Failure	Unused	RCal Multiple Groups Applied	RCal Calibrations Missing, Part of Trace	RCal Multiple Calibrations Applied, Part of Trace	RCal Apply Warning, Check RCal Status	MPAdapter Preamp Charact Failure	Unused	Unused	Align Selected Freq Range failed	Unused	Unused	Characterize Preselector Failure	Unused	Unused

STATus:QUESTIONable:CALibration:EXTended:FAILure Register

Bit	Condition	Operation
2	Characterize Preselector Failure	The preselector characterization failed
5	Align Selected Freq Range failed	The alignment for selected frequency range failed
8	MPAdapter Preamp Charact Failure	The Multiport Adaptor must be calibrated (EXT only)
9	RCal Apply Warning, Check RCal Status	The calibration request sent to the RCal module failed
10	RCal Multiple Calibrations Applied, Part of Trace	More than one calibration is being applied to part of the trace for current measurement
11	RCal Calibrations Missing, Part of Trace	The calibration being applied is not being applied to all of the trace for the current measurement
12	RCal Multiple Groups Applied	More than one calibrated rows are being applied to the current measurement
14	Misc/System Alignment Failure	Miscellaneous/System alignments have failed

- ["Questionable Calibration Extended Failure Event Query" on page 3476](#)
- ["Questionable Calibration Extended Failure Negative Transition" on page 3477](#)
- ["Questionable Calibration Extended Failure Positive Transition" on page 3477](#)

Questionable Calibration Extended Failure Condition

Returns the decimal value of the sum of the bits in the Questionable Calibration Extended Failure Condition register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	<code>:STATus:QUESTionable:CALibration:EXTended:FAILure:CONDition?</code>
Example	<code>:STAT:QUES:CAL:EXT:FAIL:COND?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Extended Failure Enable

Determines which bits in the "Questionable Calibration Extended Failure Condition" on page 3476 Register will set bits in the "Questionable Calibration Extended Failure Event Query" on page 3476 register, which also sets bit 9 of the "Questionable Calibration Register" on page 3468.

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:CALibration:EXTended:FAILure:ENABle <integer></code> <code>:STATus:QUESTionable:CALibration:EXTended:FAILure:ENABle?</code>
Example	<code>:STAT:QUES:CAL:EXT:FAIL:ENAB 1</code> Can be used to query if an EMI conducted alignment failed
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Extended Failure Event Query

Returns the decimal value of the sum of the bits in the Questionable Calibration Extended Failure Event register.

NOTE

The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	:STATus:QUESTionable:CALibration:EXTended:FAILure[:EVENT]?
Example	:STAT:QUES:CAL:EXT:FAIL?
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Extended Failure Negative Transition

Determines which bits in the "Questionable Calibration Extended Failure Condition" on page 3476 register will set the corresponding bit in the "Questionable Calibration Extended Failure Event Query" on page 3476 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	:STATus:QUESTionable:CALibration:EXTended:FAILure:NTRansition <integer> :STATus:QUESTionable:CALibration:EXTended:FAILure:NTRansition?
Example	:STAT:QUES:CAL:EXT:FAIL:NTR 1 Conducted alignment failed bit being cleared will be reported
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Extended Failure Positive Transition

Determines which bits in the "Questionable Calibration Extended Failure Condition" on page 3476 register will set the corresponding bit in the "Questionable Calibration Extended Failure Event Query" on page 3476 register when the condition register bit has a positive transition (0 to 1).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

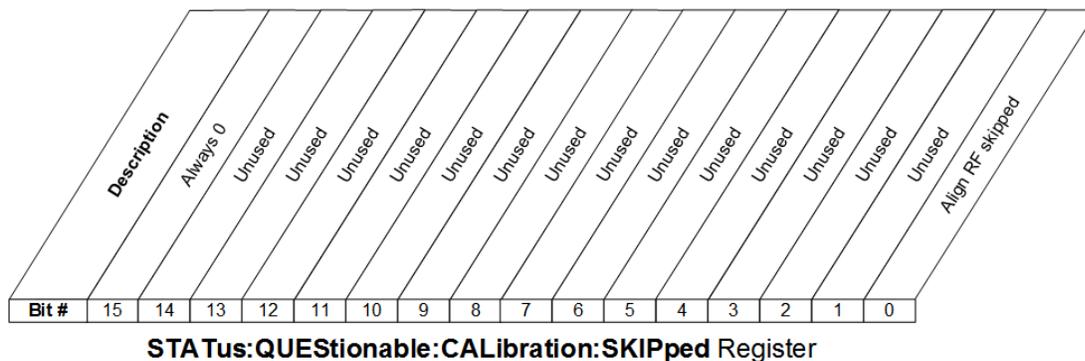

Remote Command	:STATus:QUESTionable:CALibration:EXTended:FAILure:PTRansition <integer>
----------------	---

	<code>:STATus:QUESTIONable:CALibration:EXTended:FAILure:PTRansition?</code>
Example	<code>:STAT:QUES:CAL:EXT:FAIL:PTR 1</code> Conducted alignment failed bit being set will be reported
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.12 Questionable Calibration Skipped Register

SCPI Name: `STATus:QUESTIONable:EXTended:SKIPped`

Monitors conditions that occur because a calibration or alignment has been skipped due to various settings or conditions. It summarizes them in bit 11 of the "Questionable Calibration Register" on page 3468.

Bit	Condition	Operation
0	Align RF skipped	During an alignment, the calibration of the RF section (frontend) of the instrument was not performed. This can be caused by an interfering user signal present at the RF Input See "Auto Align" on page 2746, "Align Now All" on page 2753 and "Align Now RF" on page 2757

Filter Registers

- "Questionable Calibration Skipped Condition" on page 3479

- "Questionable Calibration Skipped Event Query" on page 3479

- ["Questionable Calibration Skipped Negative Transition" on page 3480](#)
- ["Questionable Calibration Skipped Positive Transition" on page 3480](#)

Questionable Calibration Skipped Condition

Returns the decimal value of the sum of the bits in the Questionable Calibration Skipped Condition register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	:STATus:QUESTionable:CALibration:SKIPped:CONDition?
Example	:STAT:QUES:CAL:SKIP:COND?
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Skipped Enable

Determines which bits in the ["Questionable Calibration Skipped Condition" on page 3479](#) Register will set bits in the ["Questionable Calibration Skipped Event Query" on page 3479](#) register, which also sets bit 11 of the ["Questionable Calibration Register" on page 3468](#).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	:STATus:QUESTionable:CALibration:SKIPped:ENABLE <integer> :STATus:QUESTionable:CALibration:SKIPped:ENABLE?
Example	:STAT:QUES:CAL:SKIP:ENAB 1 Can be used to query if an RF alignment skipped condition is detected
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Skipped Event Query

Returns the decimal value of the sum of the bits in the Questionable Calibration Event register.

NOTE

The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	<code>:STATus:QUESTionable:CALibration:SKIPped[:EVENT]?</code>
Example	<code>:STAT:QUES:CAL:SKIP?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Skipped Negative Transition

Determines which bits in the "Questionable Calibration Skipped Condition" on page 3479 register will set the corresponding bit in the "Questionable Calibration Skipped Event Query" on page 3479 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:CALibration:SKIPped:NTRansition <integer></code> <code>:STATus:QUESTionable:CALibration:SKIPped:NTRansition?</code>
Example	<code>:STAT:QUES:CAL:SKIP:NTR 1</code> RF Align Skipped bit being cleared will be reported
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Calibration Skipped Positive Transition

Determines which bits in the "Questionable Calibration Skipped Condition" on page 3479 register will set the corresponding bit in the "Questionable Calibration Skipped Event Query" on page 3479 register when the condition register bit has a positive transition (0 to 1).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

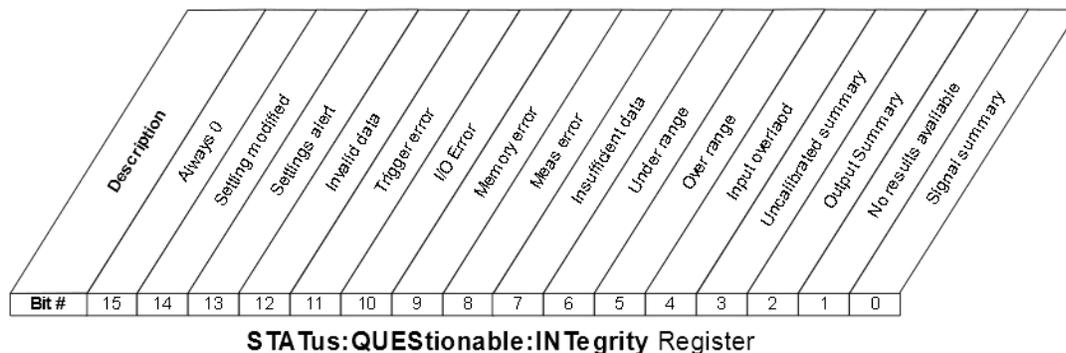

Remote Command	<code>:STATus:QUESTionable:CALibration:SKIPped:PTRansition <integer></code>
----------------	---

	<code>:STATus:QUESTIONable:CALibration:SKIPped:PTRansition?</code>
Example	<code>:STAT:QUES:CAL:SKIP:PTR 1</code> RF Align Skipped bit being set will be reported
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.13 Questionable Integrity Register

SCPI Name: `STATus:QUESTIONable:INTEgrity`

Monitors measurement integrity-related conditions within the instrument and summarizes them in bit 9 of the "Questionable Register" on page 3455. Two of the bits are summary bits from lower-level event registers.

Bit	Condition	Operation
0	Signal Summary	The summary bit for the "Questionable Integrity Signal Register" on page 3484
1	No Result	The current measurement is incompatible with a setting or combination of settings, such as the selected Input, Radio Standard, etc.
2	Output Summary	The summary bit for the "Questionable Integrity Output Register" on page 3488
3	Uncalibrated Summary	The summary bit for the "Questionable Integrity Uncalibrated Register" on page 3491
4	Input Overload	A signal overload condition exists
5	Over Range	The signal at the input for this measurement is too high. You should increase the attenuation or decrease the signal level
6	Under Range	The signal at the input for this measurement is too low. You should decrease the attenuation or increase the signal level

Bit	Condition	Operation
7	Insufficient Data	Signal or settings conditions did not allow enough data to be taken during an acquisition for a valid measurement
8	Meas Error	(not currently in use)
9	Memory Error	There is not enough memory to perform the desired operation
10	I/O Error	I/O settings are preventing communication with an instrument or peripheral
11	Trigger Error	Signal or settings conditions did not allow enough data to be taken during an acquisition for a valid measurement
12	Invalid data	The Invalid Data indicator (* in upper right of display) is on, indicating that onscreen data may be stale and not match the current settings
13	Settings Alert	Settings are not right for a valid measurement, but the instrument is nonetheless allowing a measurement to be taken
14	Setting Modified	Settings are not right for a valid measurement, and the instrument is using different settings than the ones you entered in order to take a measurement

Filter Registers

- ["Questionable Integrity Enable" on page 3483](#)
- ["Questionable Integrity Event Query" on page 3483](#)
- ["Questionable Integrity Negative Transition" on page 3483](#)
- ["Questionable Integrity Positive Transition" on page 3484](#)

Questionable Integrity Condition

Returns the decimal value of the sum of the bits in the Questionable Integrity Condition register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	<code>:STATus:QUEStionable:INTEgrity:CONDition?</code>
Example	<code>:STAT:QUES:INT:COND?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Enable

Determines which bits in the "Questionable Integrity Condition" on page 3482 Register will set bits in the "Questionable Integrity Event Query" on page 3483 register, which also sets the Integrity Summary bit (bit 9) in the "Questionable Register" on page 3455.

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUEStionable:INTEgrity:ENABle <integer></code> <code>:STATus:QUEStionable:INTEgrity:ENABle?</code>
Example	<code>:STAT:QUES:INT:ENAB 8</code> Uncalibrated Summary will be reported to the Integrity Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Event Query

Returns the decimal value of the sum of the bits in the Questionable Integrity Event register.

NOTE

The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	<code>:STATus:QUEStionable:INTEgrity[:EVENT]?</code>
Example	<code>:STAT:QUES:INT?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Negative Transition

Determines which bits in the "Questionable Integrity Condition" on page 3482 register will set the corresponding bit in the "Questionable Integrity Event Query" on page 3483 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:INTEgrity:NTRansition <integer></code> <code>:STATus:QUESTionable:INTEgrity:NTRansition?</code>
Example	<code>:STAT:QUES:INT:NTR 8</code> Uncalibrated Summary being cleared will be reported to the Integrity Summary of the Status Questionable register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Positive Transition

Determines which bits in the "Questionable Integrity Condition" on page 3482 register will set the corresponding bit in the "Questionable Integrity Event Query" on page 3483 register when the condition register bit has a positive transition (0 to 1).

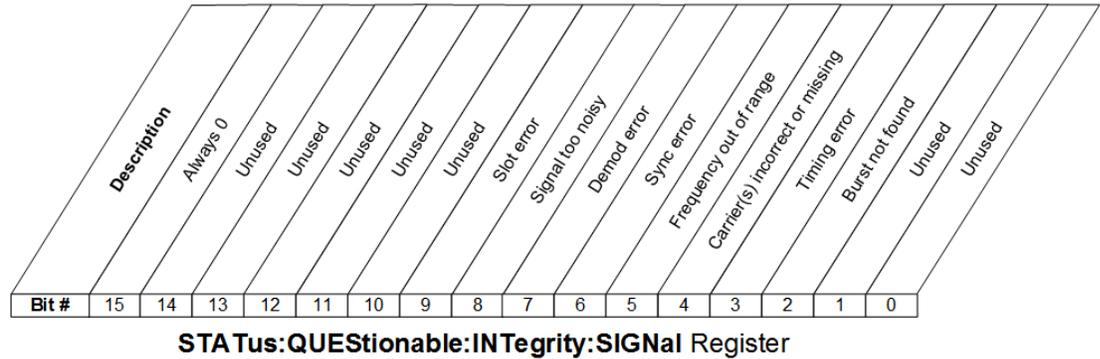

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:INTEgrity:PTRansition <integer></code> <code>:STATus:QUESTionable:INTEgrity:PTRansition?</code>
Example	<code>:STAT:QUES:INT:PTR 8</code> Uncalibrated Summary being set will be reported to the Integrity Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.14 Questionable Integrity Signal Register

SCPI Name: `STATus:QUESTionable:INTEgrity:SIGNal`

Monitors conditions that occur because a measurement may not be able to return an accurate or valid result due to signal conditions. It summarizes them in bit 0 of the "Questionable Integrity Register" on page 3481.

Bit	Condition	Operation
2	Burst not found	The instrument is expecting a bursted signal but such a signal cannot be detected because of inappropriate parameter settings or incorrect signal content
3	Timing Error	The instrument cannot establish appropriate timing from the signal
4	Carrier(s) incorrect or missing	The instrument cannot find the expected carrier(s) within the frequency ranges in which it is looking
5	Frequency out of range	One or more system or signal input frequencies are out of range
6	Sync error	The instrument cannot establish sync with the measured signal
7	Demod error	The instrument cannot demodulate the signal due to inappropriate signal or settings conditions
8	Signal Too Noisy	The instrument cannot measure the desired signal because it is too noisy
9	Slot Error	No valid signal slot found in captured data

Filter Registers

Questionable Integrity Signal Condition

Returns the decimal value of the sum of the bits in the Questionable Integrity Signal Condition register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	:STATus:QUESTionable:INTEgrity:SIGNal:CONDition?
Example	:STAT:QUES:INT:SIGN:COND?
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Signal Enable

Determines which bits in the "Questionable Integrity Signal Condition" on page 3485 Register will set bits in the "Questionable Integrity Signal Event Query" on page 3486 register, which also sets the Integrity Summary bit (bit 9) in the "Questionable Register" on page 3455.

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	:STATus:QUESTionable:INTEgrity:SIGNal:ENABle <integer> :STATus:QUESTionable:INTEgrity:SIGNal:ENABle?
Example	:STAT:QUES:INT:SIGN:ENAB 4 Burst Not Found will be reported to the Integrity Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Signal Event Query

Returns the decimal value of the sum of the bits in the Questionable Integrity Signal Event register.

NOTE The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	:STATus:QUESTionable:INTEgrity:SIGNal[:EVENT]?
Example	:STAT:QUES:INT:SIGN?

Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Signal Negative Transition

Determines which bits in the "Questionable Integrity Signal Condition" on page 3485 register will set the corresponding bit in the "Questionable Integrity Signal Event Query" on page 3486 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:INTEgrity:SIGnal:NTRansition <integer></code> <code>:STATus:QUESTionable:INTEgrity:SIGnal:NTRansition?</code>
Example	<code>:STAT:QUES:INT:SIGN:NTR 4</code> Burst not found being cleared will be reported to the Integrity Summary of the Status Questionable register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Signal Positive Transition

Determines which bits in the "Questionable Integrity Signal Condition" on page 3485 register will set the corresponding bit in the "Questionable Integrity Signal Event Query" on page 3486 register when the condition register bit has a positive transition (0 to 1).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

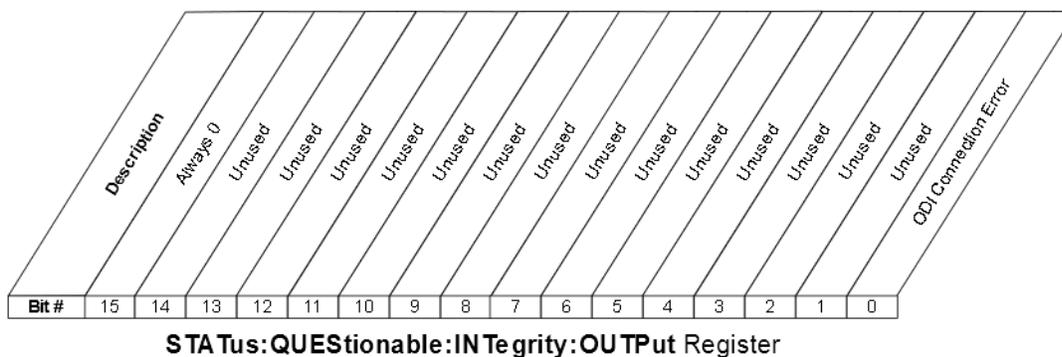

Remote Command	<code>:STATus:QUESTionable:INTEgrity:SIGnal:PTRansition <integer></code> <code>:STATus:QUESTionable:INTEgrity:SIGnal:PTRansition?</code>
Example	<code>:STAT:QUES:INT:SIGN:PTR 4</code> Burst not found being set will be reported to the Integrity Summary of the Status Questionable register
Preset	32767
Min	0

Max	32767
Status Bits/OPC dependencies	Sequential command

9.4.6.15 Questionable Integrity Output Register

SCPI Name: **STATus:QUESTIONable:INTEGRity:OUTPUT**

Monitors conditions that occur in connection status currently limited to ODI streaming . It summarizes them in bit 2 of the "Questionable Integrity Register" on page 3481.

Bit	Condition	Operation
0	ODI Connection Error	ODI Connection Error This bit is never triggered, only its aliases are

Filter Registers

- "Questionable Integrity Output Condition" on page 3488
- "Questionable Integrity Output Enable" on page 3489
- "Questionable Integrity Output Event Query" on page 3489
- "Questionable Integrity Output Negative Transition" on page 3490
- "Questionable Integrity Output Positive Transition" on page 3490

Questionable Integrity Output Condition

Returns the decimal value of the sum of the bits in the Questionable Integrity Output Condition register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	:STATus:QUESTionable:INTEgrity:OUTPut:CONDition?
Example	:STAT:QUES:INT:OUTP:COND?
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Output Enable

Determines which bits in the "Questionable Integrity Output Condition" on page 3488 register will set the corresponding bit in the "Questionable Integrity Output Event Query" on page 3489 register, which also sets the Data Output Summary bit (bit 2) in the "Questionable Integrity Register" on page 3481.

The variable <integer> is the sum of the decimal values of the bits that you want to enable.

Remote Command	:STATus:QUESTionable:INTEgrity:OUTPut:ENABle :STATus:QUESTionable:INTEgrity:OUTPut:ENABle?
Example	:STAT:QUES:INT:OUTP:ENAB 1 Oversweep (Meas Uncal) is reported to the Integrity Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Output Event Query

Returns the decimal value of the sum of the bits in the "Questionable Integrity Output Condition" on page 3488 register.

NOTE The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	:STATus:QUESTionable:INTEgrity:OUTPut[:EVENT]?
Example	:STAT:QUES:INT:OUTP?

Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Output Negative Transition

Determines which bits in the "Questionable Integrity Output Condition" on page 3488 register will set the corresponding bit in the "Questionable Integrity Output Event Query" on page 3489 register when the condition register bit has a negative transition (1 to 0).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:INTEgrity:OUTPut:NTRansition <integer></code> <code>:STATus:QUESTionable:INTEgrity:OUTPut:NTRansition?</code>
Example	<code>:STAT:QUES:INT:OUTP:NTR 1</code> Oversweep cleared is reported to the Integrity Summary of the Status Questionable register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Output Positive Transition

Determines which bits in the "Questionable Integrity Output Condition" on page 3488 register will set the corresponding bit in the "Questionable Integrity Output Event Query" on page 3489 register when the condition register bit has a positive transition (0 to 1).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

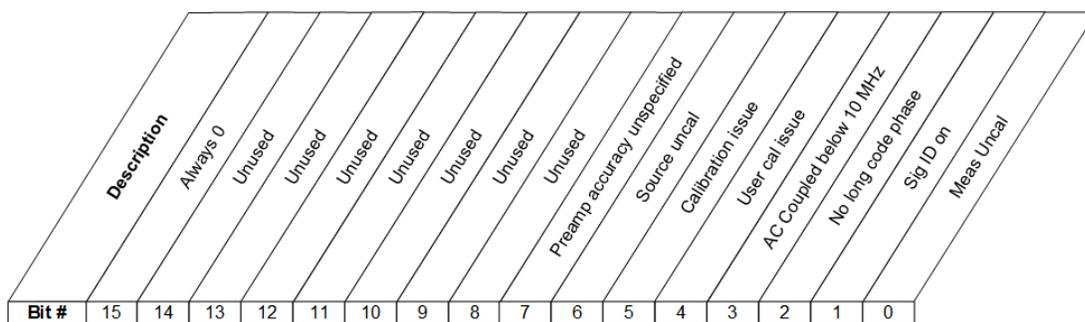

Remote Command	<code>:STATus:QUESTionable:INTEgrity:OUTPut:PTRansition <integer></code> <code>:STATus:QUESTionable:INTEgrity:OUTPut:PTRansition?</code>
Example	<code>:STAT:QUES:INT:OUTP:PTR 1</code> Oversweep set is reported to the Integrity Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767

Status Bits/OPC dependencies Sequential command

9.4.6.16 Questionable Integrity Uncalibrated Register

SCPI Name: **STATus:QUESTIONable:INTEgrity:UNCalibrated**

Monitors conditions that occur because a measurement may not be able to return an accurate or valid result due to a mismatch between instrument settings and the signal, placing the instrument in an uncalibrated state for that signal. It summarizes them in bit 3 of the "Questionable Integrity Register" on page 3481.

STATus:QUESTIONable:INTEgrity:UNCalibrated Register

Bit	Condition	Operation
0	Meas Uncal	A Meas Uncal warning is being displayed; generally this means the sweep time must be reduced or the RBW increased
1	Signal ID on	In external mixing, the Sig ID function is on, which will impact the trace results
2	No Long Code Phase	The long code phase that identifies an access channel cannot be found (WCDMA)
3	AC coupled: Accy unspec'd <10 MHz	The instrument is AC coupled but is operating below 10 MHz, where the blocking capacitor will impact measurement accuracy
4	User cal issue	In noise figure measurements, the User Cal has not been performed or has been invalidated
5	Calibration issue	In noise figure measurements, one or more calibration or measurement frequency point exceeds the currently loaded Cal or Meas ENR Table frequency ranges
6	Source uncal	While using a Tracking Source, settings are putting it into an uncalibrated operational state
7	Preamp accuracy unspecified below XX MHz	The preamp is being used but is operating below frequencies for which its accuracy is specified

Filter Registers

- "Questionable Integrity Uncalibrated Negative Transition" on page 3493
- "Questionable Integrity Uncalibrated Positive Transition" on page 3493

Questionable Integrity Uncalibrated Condition

Returns the decimal value of the sum of the bits in the Questionable Integrity Uncalibrated Condition register.

NOTE The data in this register is continuously updated and reflects the current conditions.

Remote Command	<code>:STATus:QUESTionable:INTEgrity:UNCalibrated:CONDition?</code>
Example	<code>:STAT:QUES:INT:UNC:COND?</code>
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Uncalibrated Enable

Determines which bits in the "Questionable Integrity Uncalibrated Condition" on page 3492 Register will set bits in the "Questionable Integrity Uncalibrated Event Query" on page 3493 register, which also sets the Data Uncalibrated Summary bit (bit 3) in the "Questionable Integrity Register" on page 3481.

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:INTEgrity:UNCalibrated:ENABle</code> <code>:STATus:QUESTionable:INTEgrity:UNCalibrated:ENABle?</code>
Example	<code>:STAT:QUES:INT:UNC:ENAB 1</code> Oversweep (Meas Uncal) is reported to the Integrity Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Uncalibrated Event Query

Returns the decimal value of the sum of the bits in the "Questionable Integrity Uncalibrated Condition" on page 3492 register.

NOTE

The register requires that the associated PTRansition or NTRansition filters be set before a condition register bit can set a bit in the event register. The data in this register is latched until it is queried. Once queried, the register is cleared.

Remote Command	:STATus:QUEStionable:INTEgrity:UNCalibrated[:EVENT]?
Example	:STAT:QUES:INT:UNC?
Preset	0
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Uncalibrated Negative Transition

Determines which bits in the "Questionable Integrity Uncalibrated Condition" on page 3492 register will set the corresponding bit in the "Questionable Integrity Uncalibrated Event Query" on page 3493 register when the condition register bit has a negative transition (1 to 0).

The variable <integer> is the sum of the decimal values of the bits that you want to enable.

Remote Command	:STATus:QUEStionable:INTEgrity:UNCalibrated:NTRansition <integer> :STATus:QUEStionable:INTEgrity:UNCalibrated:NTRansition?
Example	:STAT:QUES:INT:UNC:NTR 1 Oversweep cleared is reported to the Integrity Summary of the Status Questionable register
Preset	0
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

Questionable Integrity Uncalibrated Positive Transition

Determines which bits in the "Questionable Integrity Uncalibrated Condition" on page 3492 register will set the corresponding bit in the "Questionable Integrity

9 Programming the Instrument
 9.4 Status Register System & STATus Subsystem

Uncalibrated Event Query" on page 3493 register when the condition register bit has a positive transition (0 to 1).

The variable `<integer>` is the sum of the decimal values of the bits that you want to enable.

Remote Command	<code>:STATus:QUESTionable:INTEgrity:UNCalibrated:PTRansition <integer></code> <code>:STATus:QUESTionable:INTEgrity:UNCalibrated:PTRansition?</code>
Example	<code>:STAT:QUES:INT:UNC:PTR 1</code> Oversweep set is reported to the Integrity Summary of the Status Questionable register
Preset	32767
Min	0
Max	32767
Status Bits/OPC dependencies	Sequential command

10 Hardware-Accelerated Fast Power Measurement (Remote Command Only)

The **Fast Power** option (FP2) enables very fast channel power measurements for instruments with the prerequisite hardware (DP2 and/or B40). It accomplishes this by performing real-time overlapped FFTs at the hardware layer, using software for basic post-processing before returning the result to the user. The upshot of this approach is improved throughput for user applications that require many sequential power measurements.

The analysis bandwidth of FP2 may be limited by the licenses in the instrument.

NOTE

FP2 is remote-only, which means the instrument does not switch to any particular mode or measurement. FP2 commands can be sent while another application is in use on the front panel.

Each Fast Power measurement can be predefined using an array index, and up to 1,000 measurements can be stored. In the following documentation, instances of [1,2,...,999] can be substituted with a particular measurement index, for example, `:CALC:FPOW:POW1?`, `:CALC:FPOW:POW2?`, `:CALC:FPOW:POW134?`. In this way, power measurements can be defined one time in a batch, and then executed multiple times without having to redefine them, similar to “list mode” on other measurements.

In addition to basic channel power measurements, there are a number of other measurement “functions” for each channel, including peak power, peak frequency, and power spectral density.

10.1 Reset Fast Power Measurement (Remote Command Only)

Resets the measurement configuration to the defaults.

Remote Command	<code>:CALCulate:FPOWer:POWer[1,2,...,999]:RESet</code>
----------------	---

Example	<code>:CALC:FPOW:POW1:RES</code>
---------	----------------------------------

Notes	Option FP2 is required
-------	------------------------

10.2 Reset Fast Power Measurement (Remote Command Only)

Resets the measurement configuration to the defaults.

Remote Command	<code>:CALCulate:FPOWer:POWer[1,2,...,999]:RESet</code>
Example	<code>:CALC:FPOW:POW1:RES</code>
Notes	Option FP2 is required

10.2.1 Acquisition Time

Example	<code>:CALC:FPOW:POW1:DEF "AcquisitionTime=0.002"</code>
Notes	Sets the time in which the entire spectrum is measured. An increase in the acquisition time yields an improvement in measurement repeatability
Preset	0.001 s
Range	0 s to 1 s

10.2.2 Center Frequency

Example	<code>:CALC:FPOW:POW1:DEF "CenterFrequency=2e9"</code>
Notes	Sets the frequency in which the measurement is centered around. "Channel Offset Frequency Array" on page 3504 is calculated relative to the center frequency
Preset	1 GHz
Range	0 Hz to maximum instrument frequency

10.2.3 DC Coupled

Example	<code>:CALC:FPOW:POW1:DEF "DCCoupled=True"</code>
Notes	Allows you to specify whether the DC blocking capacitor is utilized. Set to True when measuring frequencies below 10 MHz
Preset	False
Range	True (DC Coupled) or False (AC Coupled)

10.2.4 Detector Type

Example	<code>:CALC:FPOW:POW1:DEF "DetectorType=Peak"</code>
---------	--

10 Hardware-Accelerated Fast Power Measurement (Remote Command Only)
10.2 Reset Fast Power Measurement (Remote Command Only)

Notes	Option FP2 is required Allows you to choose whether a RMS average or peak value is used during the measurement
Preset	RmsAverage
Range	RmsAverage, Peak

10.2.5 Do Noise Correction

Example	<code>:CALC:FPOW:POW1:DEF "DoNoiseCorrection=True"</code>
Notes	When noise correction is enabled, the linear noise power contributed by the instrument is subtracted from all measurements. This effectively lowers the noise floor of the instrument When noise correction is enabled, the first measurement for a given set of input parameters will take extra time. This is because the instrument takes an extra acquisition with the RF input disconnected from the instrument's front end to measure the noise of just the instrument. The measured noise floor is stored in a cache so the noise acquisition will occur only once for the same state settings. In other words, if noise correction was turned on and the instrument made an acquisition at frequency A, then frequency B, and back again to frequency A, the hidden initial noise floor acquisition would only occur for the first acquisition at frequency A and the cached noise floor would be used the second time frequency A was measured
Preset	False
Range	True (enable noise correction) or False (disable noise correction)

10.2.6 Do Spur Suppression

Example	<code>:CALC:FPOW:POW1:DEF "DoSpurSuppression=True"</code>
Notes	When measuring very low level signals, or when large out-of-band inputs are input into the instrument, sometimes unwanted spurs and residuals can appear in the measured spectrum. Spur suppression is a method to help minimize the levels of these internally generated spurs and residuals When spur suppression is enabled, the instrument will automatically take two acquisitions using two different internal analog LO frequencies. The FFT spectrums from both acquisitions are combined by taking the minimum power between both traces on a per FFT bin basis. External signals will have the same amplitude for both traces and therefore will return the expected amplitudes. However, low level spurs and residuals generated internally to the instrument tend to move to different FFT bins depending on the internal analog LO frequency used, and therefore tend to be suppressed using this spur suppression method Because two acquisitions, rather than a single acquisition, are made when spur suppression is enabled, the measurement time will always be slower when spur suppression is enabled
Preset	False
Range	True (enable spur suppression) or False (disable spur suppression)

10.2.7 Electronic Attenuator Bypass

Example	<code>:CALC:FPOW:POW1:DEF "ElecAttBypass =False"</code>
Notes	Allows you to either utilize or bypass the electronic attenuator. The electronic attenuator is only available for frequencies up to 3.6 GHz. Set parameter to true when using frequencies above 3.6 GHz and set the parameter to false when using the preamp
Preset	True
Range	True (bypass electronic attenuator) or False (use electronic attenuator)

10.2.8 Electronic Attenuation

Example	<code>:CALC:FPOW:POW1:DEF "ElecAttenuation=10"</code>
Notes	Option EA3 is required The electronic attenuation value parameter sets the amount of electrical attenuation from 0 to 24 dB (1 dB steps) Set "ElecAttBypass=False" to make sure the electronic attenuator path is enabled
Preset	0 dB
Range	0 – 24 dB (1 dB steps)

10.2.9 External Reference Frequency

Example	<code>:CALC:FPOW:POW1:DEF "ExternalReferenceFrequency=10"</code>
Notes	This is the user-specified frequency of the external reference: <ul style="list-style-type: none">– Used when "Frequency Reference Source" on page 3499 is set to external or auto when the external source is present– Unused if <code>FrequencyReferenceSource</code> is set to internal
Preset	10 MHz

10.2.10 Frequency Reference Source

Example	<code>:CALC:FPOW:POW1:DEF "FrequencyReferenceSource= InternalFrequencyReference"</code>
Notes	Specifies which frequency reference source should be used for this request: <ul style="list-style-type: none">– If <code>ExternalFrequencyReference</code> is selected and no external reference is present, the frequency reference unlocks but the data acquisition will continue

10 Hardware-Accelerated Fast Power Measurement (Remote Command Only)
10.2 Reset Fast Power Measurement (Remote Command Only)

- If `AutoExternalFrequencyReference` is selected, the hardware senses whether an external source is present before starting the data acquisition. If no external source is present then the internal source is selected and the data acquisition will continue

Preset	<code>InternalFrequencyReference</code>
Range	<code>InternalFrequencyReference</code> , <code>ExternalFrequencyReference</code> , <code>AutoExternalFrequencyReference</code>

10.2.11 IF Gain

Example	<code>:CALC:FPOW:POW1:DEF "IFGain=10"</code>
Notes	Allows you to specify the gain at the IF stage anywhere from -6 to 16 dB (1 dB steps). This is an advanced feature; for most cases this should remain at its default value of 0 dB
Preset	0 dB
Range	-6 – 16 dB (1 dB steps)

10.2.12 IF Type

Example	<code>:CALC:FPOW:POW1:DEF "IFType=B25M"</code>
Notes	Allows you to select between different IF paths. For example, if the signal is less than 25 MHz wide, then you can select the B25M path to take advantage of additional filtering on this analog IF path
Preset	B40M
Range	B10M, B25M, B40M

10.2.13 Include Power Spectrum

Example	<code>:CALC:FPOW:POW1:DEF "IncludePowerSpectrum=True"</code>
Notes	Allows you to read data on the entire spectrum for diagnostic purposes. It is not recommended for production use. See <code>:CALC:FPOW:POW[n]:READ2?</code> for details on the binary format of the response
Preset	False
Range	True (return both channel power and full power spectrum) False (returns only channel power)

10.2.14 Mechanical Attenuation

Example	<code>:CALC:FPOW:POW1:DEF "MechAttenuation=10"</code>
Notes	Sets the amount of mechanical attenuation anywhere from 0 to 70 dB (2 dB steps)

Preset	0 dB
Range	0 – 70 dB (2 dB steps)

10.2.15 Preamp Mode

Example	<code>:CALC:FPOW:POW1:DEF "PreAmpMode=Low"</code>
Notes	The license for the appropriate preamp is required Specifies whether the preamps are being utilized. Low allows any preamps up to 3.6 GHz, and Full allows all licensed preamps. Set "ElecAttBypass=True" in order to utilize any preamps
Preset	Off
Range	Off, Low, Full

10.2.16 Resolution Bandwidth Mode

Example	<code>:CALC:FPOW:POW1:DEF "PreAmpMode=Low"</code>
Notes	Allows you to choose whether the RBW filter is automatically or manually set. The BestSpeed value minimizes measurement time, while the Narrowest value minimizes RBW size (minimum of two FFT bins per RBW) To manually specify an RBW, set this parameter to Explicit, and set the ResolutionBW parameter to the desired value
Preset	BestSpeed
Range	BestSpeed, Narrowest, Explicit

10.2.17 Resolution Bandwidth

Example	<code>:CALC:FPOW:POW1:DEF "ResolutionBW=25e3"</code>
Notes	Sets the 3-dB bandwidth of the RBW filter. The ResolutionBWMode parameter must be set to Explicit in order to manually set the RBW
Preset	0 Hz

10.2.18 Trigger Delay

Example	<code>:CALC:FPOW:POW1:DEF "TriggerDelay=0.025"</code>
Notes	Sets the time after an external trigger is detected until the measurement is performed
Preset	0 s
Range	0 – 1 s

10.2.19 Trigger Level

Example	<code>:CALC:FPOW:POW1:DEF "TriggerLevel=2"</code>
Notes	Sets the voltage value at which an external trigger is detected
Preset	1.2 V
Range	-5 to 5 V

10.2.20 Trigger Slope

Example	<code>:CALC:FPOW:POW1:DEF "TriggerSlope=Negative"</code>
Notes	Specifies the direction of the edge trigger voltage for detection
Preset	Positive
Range	Positive, Negative

10.2.21 Trigger Source

Example	<code>:CALC:FPOW:POW1:DEF "TriggerSource=Ext1"</code>
Notes	Allows you to choose between measurement's triggering freely or controlled by an external input. Ext1 and Ext2 correspond to Trigger 1 In and Trigger 2 In, respectively
Preset	Free
Range	Free, Ext1, Ext2

10.2.22 Trigger Timeout

Example	<code>:CALC:FPOW:POW1:DEF "TriggerTimeout=0.1"</code>
Notes	Sets the time in which the instrument will wait for a trigger before automatically performing the measurement
Preset	1 s
Range	0 – 1 s

10.2.23 Signal Input

Example	<code>:CALC:FPOW:POW1:DEF "SignalInput=Fp50MHzCW"</code>
Notes	Allows you to select between using the main RF input or the internal instrument reference CW signal of 50 MHz

Preset	FpMainRf
Range	FpMainRf, Fp50MHzCW

10.2.24 Use Preselector

Example	<code>:CALC:FPOW:POW1:DEF "UsePreSelector=True"</code>
Notes	Allows you to either utilize or bypass the front end tunable filter at frequencies above 3.6 GHz. For frequencies below 3.6 GHz, the preselector is automatically bypassed, so you do not need to set this parameter to False in those cases
Preset	False
Range	True (use preselector above 3.6 GHz) False (preselector bypassed)

10.2.25 Channel Bandwidth Array

Example	<code>:CALC:FPOW:POW1:DEF "Bandwidth=[3.84e6, 5e6, 3.84e6]"</code>
Notes	Defines the bandwidth of each channel that will be measured All array parameters should have the same number of elements. Alternatively, if all the elements are the same value, a single number with no square brackets can be used to define the parameter
Preset	[1e6]
Range	0 to 40 MHz

10.2.26 Channel Filter Type Array

Example	<code>:CALC:FPOW:POW1:DEF "FilterType=[RRC, IBW, RRC]"</code>
Notes	The filter type parameter allows you to choose between an integration bandwidth (IBW) filter or a root-raised-cosine (RRC) filter. The integration bandwidth filter weighs all frequencies within the bandwidth equally. The root-raised-cosine filter has an associated shape parameter, defined by the FilterAlpha parameter All array parameters should have the same number of elements. Alternatively, if all the elements are the same value, a single value with no square brackets can be used to define the parameter
Preset	[IBW]
Range	IBW, RRC

10.2.27 Channel Filter Alpha Array

Example	<code>:CALC:FPOW:POW1:DEF "FilterAlpha=[0.5, 0.0, 0.5]"</code>
---------	--

10 Hardware-Accelerated Fast Power Measurement (Remote Command Only)
 10.2 Reset Fast Power Measurement (Remote Command Only)

Notes	The filter alpha parameter allows you to adjust the alpha value associated with the root-raised-cosine (RRC) filter type. Set FilterType to RRC in order to utilize this parameter All array parameters should have the same number of elements. Alternatively, if all the elements are the same value, a single number with no square brackets can be used to define the parameter
Preset	[0.22]
Range	0.0 – 1.0

10.2.28 Channel Measurement Function Array

Example	<code>:CALC:FPOW:POW1:DEF "Function=[BandPower, PeakPower, BandPower]"</code>												
Notes	This parameter array defines what measurement is being made for each individually-specified channel: <table border="1"> <tr> <td>BandPower</td> <td>Total power within the specified bandwidth of the channel (dBm)</td> </tr> <tr> <td>BandDensity</td> <td>Total power density within the specified bandwidth of the channel (dBm/Hz)</td> </tr> <tr> <td>PeakPower</td> <td>The peak power value within the specified bandwidth of the channel (dBm)</td> </tr> <tr> <td>PeakFrequency</td> <td>The frequency which corresponds to the peak power value within the specified bandwidth of the channel. This frequency is relative to the center frequency (Hz)</td> </tr> <tr> <td>XdBBandwidth</td> <td>The half power (-3.01 dB) bandwidth of the highest amplitude signal that resides within the channel (Hz), dB is configurable using XdBBandwidth parameter</td> </tr> <tr> <td>OccupiedBandwidth</td> <td>The bandwidth at which 99% of the total power resides within the channel (Hz), percentage configurable using OccupiedBandwidthPercent parameter</td> </tr> </table> All array parameters should have the same number of elements Alternatively, if all the elements are the same value, a single value with no square brackets can be used to define the parameter	BandPower	Total power within the specified bandwidth of the channel (dBm)	BandDensity	Total power density within the specified bandwidth of the channel (dBm/Hz)	PeakPower	The peak power value within the specified bandwidth of the channel (dBm)	PeakFrequency	The frequency which corresponds to the peak power value within the specified bandwidth of the channel. This frequency is relative to the center frequency (Hz)	XdBBandwidth	The half power (-3.01 dB) bandwidth of the highest amplitude signal that resides within the channel (Hz), dB is configurable using XdBBandwidth parameter	OccupiedBandwidth	The bandwidth at which 99% of the total power resides within the channel (Hz), percentage configurable using OccupiedBandwidthPercent parameter
BandPower	Total power within the specified bandwidth of the channel (dBm)												
BandDensity	Total power density within the specified bandwidth of the channel (dBm/Hz)												
PeakPower	The peak power value within the specified bandwidth of the channel (dBm)												
PeakFrequency	The frequency which corresponds to the peak power value within the specified bandwidth of the channel. This frequency is relative to the center frequency (Hz)												
XdBBandwidth	The half power (-3.01 dB) bandwidth of the highest amplitude signal that resides within the channel (Hz), dB is configurable using XdBBandwidth parameter												
OccupiedBandwidth	The bandwidth at which 99% of the total power resides within the channel (Hz), percentage configurable using OccupiedBandwidthPercent parameter												
Preset	BandPower												
Range	BandPower, BandDensity, PeakPower, PeakFrequency, XdBBandwidth, OccupiedBandwidth												

10.2.29 Channel Offset Frequency Array

Example	<code>:CALC:FPOW:POW1:DEF "OffsetFrequency=[-5e6, 0, 5e6]"</code>
Notes	The offset frequency parameter array defines the difference between the center frequency to the center frequency of each channel All array parameters should have the same number of elements
Preset	[0]
Range	0 to 20 MHz

10.2.30 Channel Occupied Bandwidth Percent Array

Example	<code>:CALC:FPOW:POW1:DEF "OccupiedBandwidthPercent =[0.95, 0.95, 0.95]"</code>
Notes	This parameter only applies for channels whose Function is set to OccupiedBandwidth. The occupied bandwidth percent parameter specifies the percent of total power in these channels. The valid range for this parameter is 0.0 to 1.0, where 1.0 represents 100%. The default for this parameter is 0.99, which will return the bandwidth that contains 99% of the total channel power
Preset	[0.99]
Range	0 – 1.0

10.2.31 Channel x-dB Bandwidth Array

Example	<code>:CALC:FPOW:POW1:DEF " XdBBandwidth =[-6.02, -3.01, -1.0]"</code>
Notes	This parameter only applies for channels whose Function is set to XdBBandwidth. The X dB bandwidth parameter is used to specify the power relative to the peak channel power over which the bandwidth is calculated. The parameter value must be a negative number
Preset	[-3.01]
Range	-200 to 0 dB

10.3 Define Fast Power Measurement Query (Remote Command Only)

Retrieves a list of all defined parameters in an ASCII string format

The following is an example of returned results:

```
"DCCoupled=False, ElecAttBypass=True, ElecAttenuation=0, IFGain=0, MechAttenuation=0, PreAmpMode=Off, PreSelectorOffset=0, UsePreSelector=False, ExternalReferenceFrequency=10000000, FrequencyReferenceSource=AutoExternalFrequencyReference, IFType=B40M, LOMode=SLW, SignalInput=FpMainRf, AcquisitionTime=0.001, CenterFrequency=100000000, ResolutionBW=0, ResolutionBWMode=BestSpeed, DetectorType=RmsAverage, Bandwidth=[1000000], OffsetFrequency=[0], Function=[BandPower], FilterType=[IBW], FilterAlpha=[0.22], OccupiedBandwidthPercent=[0.99], XdBBandwidth=[3.01], DoNoiseCorrection=False, DoSpurSuppression=False, MeasurementMethod=HardwareFFT, IncludePowerSpectrum=False, TriggerDelay=0, TriggerLevel=1.2, TriggerSlope=Positive, TriggerSource=Free, TriggerTimeout=1"
```

Remote Command	:CALCulate:FPOwer:POWer[1,2,...,999]:DEFine?
----------------	--

Example	:CALC:FPOW:POW1:DEF?
---------	----------------------

Notes	Retrieves a list of all defined parameters in an ASCII format
-------	---

10.4 Configure Fast Power Measurement (Remote Command Only)

Begins hardware setup and returns immediately, with no acquisition made. This can be used in parallel with other hardware operations to effectively hide the hardware setup time.

Remote Command	<code>:CALCulate:FPOWer:POWer[1,2,...,999]:CONFigure</code>
Example	<code>:CALC:FPOW:POW1:CONF</code>
Notes	Option FP2 is required

- 10 Hardware-Accelerated Fast Power Measurement (Remote Command Only)
- 10.5 Initiate Fast Power Measurement (Remote Command Only)

10.5 Initiate Fast Power Measurement (Remote Command Only)

Begins an acquisition and returns immediately. The results of the measurement can be retrieved using `:FETCh`.

Remote Command	<code>:CALCulate:FPOWer:POWer[1,2,...,999]:INITiate</code>
Example	<code>:CALC:FPOW:POW1:INIT</code>
Notes	Option FP2 is required

10.6 Fetch Fast Power Measurement (Remote Command Only)

Used to retrieve the results of an acquisition initiated by `:INIT`. The returned results are in *ASCII string* format. The string begins and ends with quotation marks.

Remote Command	<code>:CALCulate:FPOWer:POWer[1,2,...,999]:FETCh?</code>
Example	<code>:CALC:FPOW:POW1:FETC?</code>
Notes	<p>Option FP2 is required</p> <p>Returns m comma-separated ASCII values, where m corresponds to the number of bandwidths defined</p> <ol style="list-style-type: none">1. Declared function return in the 1st specified channel2. Declared function return in the 2nd specified channel...m. Declared function return in the last specified channel <p>The INIT and FETC? command sequence performs the same functionality of a single CALC:FPOW:POW [n]? query. Units of the returned values are dependent on the Function parameter for each channel</p>

10.7 Execute Fast Power Measurement (Remote Command Only)

This query is shorthand for `:INIT` immediately followed by `:FETC?`. The returned results are in *ASCII string* format. The string begins and ends with quotation marks.

Remote Command	<code>:CALCulate:FPOWer:POWer[1,2,...,999]?</code>
Example	<code>:CALC:FPOW:POW1?</code>
Notes	Option FP2 is required See notes for Fast Power Fetch for return format

10.8 Binary Read Fast Power Measurement (Remote Command Only)

This query is shorthand for `:INIT` immediately followed by `:FETC?`. The returned results are in *binary format*.

Remote Command	<code>:CALCulate:FPOWer:POWer[1,2,...,999]:READ?</code> <code>:CALCulate:FPOWer:POWer[1,2,...,999]:READ1?</code>
Example	<code>:CALC:FPOW:POW1:READ?</code> <code>:CALC:FPOW:POW1:READ1?</code>
Notes	Option FP2 is required Returns m 4 byte floating point binary values (Little-Endian), where m corresponds to the number of bandwidths defined

10.9 Diagnostic Binary Read Fast Power Measurement (Remote Command Only)

This query is shorthand for `:INIT` immediately followed by `:FETC?`. The returned results are in *binary format*. This command is used primarily for diagnostic purposes, to test for ADC overloads and to visibly inspect the spectrum.

Remote Command	<code>:CALCulate:FPOWer:POWer[1,2,...,999]:READ2?</code>
Example	<code>:CALC:FPOW:POW1:READ2?</code>
Notes	<p>Option FP2 is required</p> <p>Note: Spectrum data is only returned if the IncludePowerSpectrum parameter is set to True. If IncludePowerSpectrum is False, the number of spectrum points will be zero (0)</p> <p>Units of the returned values are dependent on the Function parameter per channel (e.g. dBm for BandPower, Hz for PeakFrequency)</p> <p>Returns binary data (Little-Endian) that contains information on m amount of channels, along with ADC over range and full spectrum data</p> <p>The following is the binary format of the response</p> <p>Bandwidth Return Value</p> <ol style="list-style-type: none"> 1. Number of channels specified, m [4 byte int] 2. Declared function result for the 1st specified channel [4 byte float] 3. Declared function result for the 2nd specified channel [4 byte float] <p>...</p> <p>(m + 1). Declared function result for the last (mth) specified channel [4 byte float]</p> <p>ADC Over Range</p> <ol style="list-style-type: none"> 1. ADC over-range occurred (1: true, 0: false) [2 byte short] <p>Spectrum Data</p> <ol style="list-style-type: none"> 1. Number of points in the spectrum data, k [4 byte int] 2. Start frequency of spectrum data (Hz) [8 byte double] 3. Step frequency of spectrum data (Hz) [8 byte double] 4. FFT bin at 1st point (dBm) [4 byte float] 5. FFT bin at 2nd point (dBm) [4 byte float] <p>...</p> <p>(k + 3). FFT bin at last (kth) point (dBm) [4 byte float]</p>
